3909 Q. This contact rail is bonded, is it not, the joints of the contact rail are?

A. Yes.

Q. What do you mean by "bonded?"

A. The two ends of the rails are connected together by copper bonds or conductors of sufficient capacity to carry the current.

Q. And if such rail joints are bonded with 300,000 cir. mils. copper bond you would consider they were amply bonded for the current which they carry, would you not?

A. Yes.

Q. And they are so bonded, are they not?

A. Yes.

Q. Do you now whether the negative busbars and return feeder cables are adequately insulated from the ground in the subway?

A. In my opinion they are. The practice which obtains there is to connect together all the lead sheaths or coverings on the negative cables or return feeders. In addition to all this, the lead sheaths of the positive feeders are connected together and the current is taken off of them, in case there is any leakage. In addition to both of these precautions the lead sheaths of all the high tension cables are connected together, and current taken off of those, if any leakage occurs, and in all these cases the endeavor is made, and has been made successfully in the case of the subway, to insulate the negative feeders and also the other feeders, both positive and high tension, from the ground in order to prevent the passage of the return current or the leakage current from these lead sheaths to the ground and cause breakdowns.

Q. And what you have just said in this connection is also true of the elevated structure, is it not?

3910 A. Not at present to the same extent. They have already commenced to put the Manhattan Elevated return system and cables on the same basis as the subway, that is by insulating the return feeders and keeping the negative currents, as you might call them, on their own feeders, and cables and structure.

Q. Now the tracks in the subway are laid on stone ballast, which in itself is a non-conductor, is it not?

A. The tracks are laid directly on the wooden ties.

Q. Yes.

A. And they on a stone ballast, and that on the concrete floor of the subway so that——

Q. So it interposes between the current bearing rail and the ground a very high resistance?

A. A high resistance.

Q. A high resistance?

A. Compared with the potential which exists between the service rail, the running rail and the ground.

Mr. Mathewson: Are you referring to the subway or elevated?

Mr. Kirby: I am referring to the subway. I have not got to the elevated yet, except about one question, which I asked him particularly.

Q. In your opinion with such a system as you have described as the one installed and in use in the subway, would or would not you think it highly improbable that currents would stray therefrom, that is, would follow other than the circuits intended for their return to the power station?

A. In my opinion the steps which have been taken and are now in use to prevent currents from straying from the return circuit are successful in preventing this difficulty.

Q. Now, we come to the third electric road, that is the elevated. Will you describe for us, the system which has been installed 3911 or is in operation in the elevated road in reference to the current and the method of supplying the power to its train?

A. In the Manhattan system the current is sent out from numerous substations directly to the third-rail without any additional feeder service and passes through the motors and returns through the following paths: the service rails, which are bonded at all their joints with No. 0000 bonds through the longitudinal girders of the structure; through return feeders of 1,500,000 cir. mils supplementing the other paths; and by the service rails, that is, all the service rails on the Manhattan are used as a return. So we have this arrangement — all the service rails, all the longitudinal girders and heavy copper return feeders, acting as a path to bring back the currents to the negative bus of the substations; in all cases the negative bus is insulated from the ground and other electrical circuits.

Q. That is, the positive supply feeder is the contact rail, isn't it?

A. The contact rail, otherwise known as the third rail.

Q. That is the rail upon which the wheels do not run?

A. Yes.

Q. That is insulated?

A. Yes, that is carefully insulated on what are known as reconstructed granite insulators.

Q. Vitrified clay insulators, is that the same thing?

A. No, that is not the same.

Q. But all insulators of very high resistance and proper for the purpose, in your opinion?

A. Yes.

Q. And the return circuits being in part the rails, have their joints bonded, have they not?

A. Yes.

Q. And these bonds consist of what?

A. They consist of heavy copper of either No. 000 or No. 0000, depending upon the character of the traffic, and the service rails are also bonded to the longitudinal girders of the structure. 3912

Q. Would this mean that the return circuit would be one of great conductivity?

A. Yes.

Q. Is it not a fact that the drop upon this circuit is very small by reason of such great conductivity?

A. The drop, of course, varies with the current employed. If you mean the——

Q. I do not mean when trains are passing over the road and using up current, but I mean the return circuit considered by itself?

A. It would have a very small drop for a comparatively small current, but of course the drop increases directly with the current used.

Q. Certainly, but the drop could be relatively small, would it not, by reason of the great conductivity of the return circuit?

A. Yes, except—relatively small as compared with a great many other things.

Q. Yes, relatively small compared with a system which would not have a bonded rail return or without that rail supplemented by longitudinal girders of an iron or steel structure?

A. Yes, that is so.

Q. And in your opinion, such a system consisting, as you have stated, of a bonded return, bonded rail return, supplemented by part of the structure itself, would be such as to prevent currents in any large or appreciable amount leaving the return placed there for that purpose and doing what is commonly called "straying" therefrom, would it not?

A. It is my opinion that with the construction that has been cited and with the additional construction now so successfully employed on the subway, that the difficulty, if any, from stray currents from the elevated will be practically or almost entirely done away with.

Q. Now, is it not a fact that any stray currents so-called
3913 means lost currents or lost energy or current put to no good use by the source from which they emanate, be it anything, and that therefore every effort should be made, and in your personal knowledge is being made, to prevent the same for this reason, if for no other reason?

A. As related to the Manhattan system?

Q. And any other system from which there might be such stray currents. In other words, do not stray currents mean a loss of energy, and therefore a loss of coal and therefore a loss of dollars and cents?

A. Every effort should be made by operating companies to keep the current on their own property, their own paths of conduction, to diminish their own loss and to prevent trouble with other systems, and other properties.

Q. From your knowledge of the various means and conductors in the street mains and conductors in the streets of the Borough of Manhattan, if it should happen that there should be a stray current or stray currents in the streets, what path do you think the current would take to return to that point where it would reach a plane of the same voltage as that from which it started?

A. It would take the paths or path of greatest conductivity.

Q. And in your opinion would that be a gas pipe or a water main or a lead sheathed cable or lead sheathed cables for telephone or telegraph or other customary purposes?

A. In my opinion it would naturally take the lead sheathed cable path as those paths are continuous and they are large as to carrying capacity and low in conductivity, whereas the gas pipes and water pipes and other subsurface structures have varying conductivities and therefore paths varying in resistance for such currents.

Q. You have spoken of the various electric roads in the city. Are there any other sources which supply electric current in any
3914 considerable amount that you are aware of?

A. Why, the telegraph companies supply simply a small amount of current. That is negligible in this proposition. The Edison Company supplies a large amount of current for the operation of their system, but they endeavor to keep their system free from grounds or connections with the earth except in the case of what is known as the neutral wire on their distribution circuits.

Q. You are familiar with the system which is used by the Edison Company in this borough, are you not?

A. Yes, I am.

Q. And you have spoken of the subway as being a three wire system, and of those three wires one being known as positive, one known as negative, and the third wire being known as neutral?

A. Yes.

Q. Do you know whether or not that neutral wire is what is known as a grounded wire?

A. It is grounded.

Q. What do you mean by a neutral wire and what do you mean by its being grounded?

A. It might be well if I should delineate the general system of the

Edison Company in order to lead up to the description of the neutral wire.

Q. Well, do so. It is rather important.

A. In the main power house of the Edison Company the electric current is generated, transmitted as an alternating current at high pressure to the substations, is then transformed to a low voltage and at the same time changed to a direct current and distributed on their systems for consumers, in a three wire system. That is, there is one positive wire, a neutral wire and a negative wire; the difference of potential between positive and negative wire is twice that between either the negative and positive wire and the neutral. The neutral is connected to the ground for two purposes, the first one being to prevent consumers from receiving electric shocks, which although not dangerous, might startle them, and the second one is to prac-
3915 tically neutralize the potential in the Edison system. In order that this latter idea may be accomplished, currents must pass from one neutral to another through these ground connections, in order to carry out the idea of equalizing the potentials.

Q. And these currents in passing from one neutral to another, pass through such conductors as may be found in the ground and would be stray currents, would they not?

A. Yes.

Q. And would set up such electrolytic or other action as any other stray current might set up?

A. Yes, it would. It might be large in amount, and it might be very small in amount, but would vary with the conditions of load on the system, and the difference of potential which exist between these grounded points.

Q. Do you think it would be possible to so use the system as to have the neutral wires always approximately of the same sort of potentiality so that there would be no current flowing from one to the other?

A. Not under the conditions and circumstances that I have noted.

Q. And those conditions and circumstances are those in use in the Borough of Manhattan, are they not?

A. Yes.

Q. So, then we have four important sources of electrical energy in the Borough of Manhattan, the Metropolitan Street Railway, the Subway, the Elevated and the Edison systems; am I right in that?

A. Yes.

Q. Any other source of electric energy as the same exists at the present time would by comparison to these four sources which I have mentioned be of slight importance, would it not?

A. Yes, they would.

Q. Now, if by reason of the systems now installed by the Metropolitan Street Railway, in the subway and in the elevated, and if such precautions as are being used upon such systems for the pre-
3916 vention of currents therefrom, and by reason of such methods as have been adopted for such prevention and which are to be used supplemental to those now in use in the ways in which you have indicated, if stray currents should appear in the streets of

New York, would you not consider it probable that the same emanated from the circuits of the Edison Company?

Mr. **Matthewson**: I object to that question as being purely a conclusion and involving assumptions upon which conclusions are asked.

The **Master**: I will allow him to answer it. I suppose you propose to connect it later, Mr. Kirby.

Mr. **Kirby**: I think it is connected.

Question allowed; exception.

A. The installations which the subway has made and the Manhattan Company is operating and is to make, in my opinion will prevent stray currents from passing from their property and structures, on to extraneous structures or subsurface conductors. Then there will be in the City a number of sources of stray currents, some large in magnitude and others small. The small ones I have cited; those of the telegraph companies. There is, in my opinion, the possibility of a considerable passage of current between these unbalanced neutrals of the New York Edison Company. There is also another source of current in Manhattan Borough which has not been cited and I think should be mentioned; that is, current passing across from Brooklyn on the Brooklyn Bridge and wandering to a slight extent around the lower end of Manhattan; also passing up the Bowery, both on the elevated and on the surface railway system to the Williamsburgh Bridge and going back to Brooklyn. That I should like to mention as a proper engineering report.

Q. But with all these elements and various sources of electric current before you, do you or do you not consider that the conditions as affecting stray currents with possible electrolytic action therefrom in the streets of the Borough of Manhattan are improving or becoming worse? 3917

A. I think they are improving. I think that if any electrolytic corrosion is noted by any owners of sub-surface structures, including the City itself, it will be only in isolated cases which can be handled by proper precautionary measures locally applied.

Q. I note that you are reported in a report on the City of New York, Manhattan and The Bronx, issued by the National Board of Fire Underwriters Committee of Twenty, November, 1905, as follows:

"Professor G. F. Sever, consulting engineer of the Department of Water Supply, Gas and Electricity, has made a few tests in both boroughs, but the results were never collated. They showed, however, that pipes were only slightly positive to the ground.

The Interborough Rapid Transit Company has made tests on its system, but the results were not obtainable. Some leakage has occurred from the elevated structure, but it is not known to have caused damage. Other companies report no trouble from leakage or electrolysis."

Q. Is that your opinion of the situation as it exists to-day, insofar as set forth in that statement which I have read?

A. Yes.

Mr. **Kirby**: There may be a few more questions I would like to ask. It is five o'clock and we may adjourn, I think.

Mr. **Burr**: Before we adjourn I want to call the Master's attention to City's Exhibit 55, which was ruled out. I refer to the extract from the Tribune, purporting to be a copy of an official communication from the Consolidated Gas Company furnished to all 3918 the papers of that date in question, which appears upon the record. I asked Mr. Garver at the time and I asked Mr. Mathewson to-day whether they would assent to that being an official record or statement of the company, and I understood Mr. Garver to say at the time that apart from his objection to its being immaterial and irrelevant, he was not then in a position to say that it was an authoritative statement. That did purport to be an official statement of the company, and I have asked Mr. Mathewson to-day, and I would like to know whether they are prepared to admit that as an official statement of the Consolidated Gas Company upon the record of this case.

Mr. **Mathewson**: Certainly not. I don't know anything about it and I have no knowledge that it was an official statement or was even a statement handed out by the Consolidated Gas Company. I say that in addition to the proposition that is is utterly immaterial and irrelevant and valueless, so far as this proposition is concerned.

Mr. **Burr**: That is your opinion. I think it is quite an important admission as against interest by the company and therefore if you will not admit it I propose to call all the officers of the company to ascertain by whose authority that was stated at the time or published in every newspaper in the City of New York.

Mr. **Mathewson**: Mr. Burr, I simply don't know anything about it. I never heard of it until you produced the so-called newspaper statement here.

At 5:05 P. M. adjourned until Monday, November 5, 1906, at 10:30 A. M.

3919 Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,
vs.
JULIUS M. MAYER, as Attorney General of the State of New York; WILLIAM TRAVERS JEROME, as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIAN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and THE CITY OF NEW YORK, Defendants.

Before Arthur H. Masten, Special Master.

NEW YORK, *November* 5, 1906.

Met pursuant to adjournment.
Present: The Master, Mr. Mathewson, Mr. Kirby, Mr. Burr.

3920 Mr. BURR: Before proceeding, I wish to state that I received a letter from Professor Bemis giving a list of the changes which he desires to make in his testimony growing out of typographical errors; in the testimony not including the recross-examination of October 30th.

The MASTER: Attend to that some time outside of the hearing, with counsel.

Mr. BURR: I submit this to the stenographer, and will have a copy made.

Mr. MATHEWSON: Before you submit it, I would like to go over it; before the corrections are made, because some of them we may not think are typographical errors.

Mr. BURR: I will have a copy of this made and present it to you. Now, we have arrived at a point in the investigation of the books where Dr. Marks and his assistants are desirous of checking off the sizes of the mains on the map of mains, the books of maps of mains, in the office of the Consolidated Gas Company. On Saturday they were all ready to proceed in that direction, and Mr. Carter and Mr. Simpson, I understand, refused to permit the examination to be made until they consulted with Mr. Mathewson, who was out of town, and they said they would communicate with him this morning. Dr. Marks was there this morning with his people for the purpose of making the examination, and I understand Mr. Carter and Mr. Simpson communicated with Mr. Mathewson, and the result is they have refused to permit the examination of these books of maps to be made. That is a very important matter to us for the purpose of completing the inventory of the property of the company, the item of mains alone representing some $12,000,000, as claimed by the company, and embracing some 822 miles of mains in the 3921 streets of the City of New York. Now, we simply desire from the books that are there, which are in their possession, in the office of the company, to check off the sizes and lengths of mains as testified to by Mr. Simpson in this proceeding, all with a view to verifying the amount of money invested in the business for the year 1905, which is the period on which we are working, and to which Exhibit 94 relates, so that I ask that the company be instructed to permit the accountants and Dr. Marks to make this examination of the maps of mains for the purpose of checking off the lengths and sizes of those.

Mr. MATHEWSON: I think Mr. Burr has put it a little strongly when he says Mr. Mathewson refused this morning to permit the examination, or that Mr. Carter on instructions of Mr. Mathewson did.

Mr. BURR: I said that is what Dr. Marks stated, as he understood it.

Mr. MATHEWSON: The situation is this: The books of the company show the lengths of the mains and the sizes of the different mains, and those books have been checked off, or I understand can be checked off. What it is now desired to examine are not the books at all, but maps showing the main system of the company. In other words, ordinary insurance maps which are employed for that purpose, as I understand it. A map of that character, when you come to feet of mains, and on that small scale, is not anything that you can figure by at all. The accurate figures are in the books of the company, but this is merely a graphic and general illustration for our purposes of where the mains lay without intending to run to a foot, and I do not see that there is anything to be gained by going over those maps. If it was desired to check off the different sizes and lengths from those maps, I am informed by Mr. Carter it would
be a work of months. The books of the company which
3922 show the lengths of mains have been checked, haven't they,
Dr. Marks? The books, the records of the lengths and sizes
of mains, you have?

Mr. MARKS: It is impossible to check them save either by going out and measuring the mains, or by the briefer method, which would occupy about one week of rapidly checking off the lengths and sizes of the mains as laid down from the maps.

Mr. MATHEWSON: Do not these lengths and sizes appear in the books of the company; not on the maps?

Mr. MARKS: Not in the books as yet furnished.

Mr. MATHEWSON: Have you asked for any such books?

Mr. MARKS: I have.

Mr. MATHEWSON: Has there been any objection to that?

Mr. BURR: We have repeatedly asked for the books and the maps from the beginning when we went up there to examine these mains for the period of 1905, and we understood there would be no objection to examining them.

Mr. MATHEWSON: A map is not a primary record.

The MASTER: Mr. Burr says the books are made up from the maps.

Mr. MATHEWSON: No, on the contrary, the maps are made up from the record? If we lay a mile of main, we buy the pipe and pay for it, we know how much we bought, and we know the streets it goes through, and we then put that down on the maps, so it is a secondary record, it is not a primary record at all; we do not put it down and then measure on the map and see how far it is and then enter that into a book. That would be ridiculous.

The **Master**: Under the circumstances I shall have to ask Mr. Burr to furnish something a little more specific than this informal statement. You will have to give me some affidavit or statement of Dr. Marks showing exactly what book they have been 3923 afforded access to containing entries regarding mains and also specify the books to which they have been refused access, and then I will take such statement or affidavit as the Consolidated Gas Company submits for the purpose of determining which is the book of primary entry and decide the matter.

Mr. **Burr**: Of course a map is not a book of account, and a book of maps is not a book of accounts, and I cannot see, nor has Mr. Mathewson stated, any good or valid or substantial reasons for objecting to our inspecting the maps. Any effort we are making is a sincere one to ascertain what is the exact condition of affairs for 1905.

The **Master**: No, but on his statement of the facts, assuming them to be correct, I do not see but what every object you can attain can be accomplished better by checking off the entries in the books than by the maps. As I understand his proposition, these maps serve the same sort of purpose that a progress profile does on a construction contract. The estimates and measurements of the engineers would be the primary evidence as to the amount of work generally, but for the purposes of convenience and easy reference it is customary for engineers to plot out on a progress profile the statement showing the manner in which the work is progressing. Now, it may be quite accurate and it may be only approximately accurate. It is not the original record of what is being done. As I understand him, these maps are of the same character. Now, if that is so, I do not think there is any point in your having access to them. If it is not so, I think you ought to have access to them.

Mr. **Burr**: The books, of course, would not show the location and the maps would. When you consider the testimony in this case that there are 822 miles of mains—some testimony has been to the 3924 effect that there was 790, then again the testimony has been 822 miles—and that there are 422 streets open in the City of New York, in the Borough of Manhattan, we would like to know from these maps where these mains are located, as well as their sizes and lengths.

Mr. **Mathewson**: Oh, I see. That was not included in the original statement.

Mr. **Burr**: I say the books do not show the location of the mains.

Mr. **Mathewson**: I don't know whether they do or not.

Mr. **Burr**: If there is a duplication of the mains, we are entitled to know that.

Mr. **Mathewson**: I don't know that it is very material.

Mr. **Burr**: I am surprised there should be any objection made to the examination of the maps at all.

Mr. **Mathewson**: On the question of duplication, I think it appears by Mr. Simpson's testimony in streets, as distinguished from avenues, there is very little duplication in the streets. In the evidence, as I stated to you, Broad, required services on both sides, and so forth. There are different lines of mains in many instances; properly so.

The Master: Is or is it not the fact that the books to which Dr. Marks and his associates have had access show the location of the mains?

Mr. Mathewson: I suppose so, but upon that point I am not specially informed. I will take it up.

The Master: Then we had better defer action on that until later, and you can do something about that during the day.

Mr. Burr: The time is getting short and Dr. Marks says we can get it all done in a week or ten days.

The Master: My experience shows me where it is a matter
3925 or oral discussion it is so inconvenient and uncertain that for
my own satisfaction I should like to have something down in black and white, showing a little more specifically what is desired, in case there is any objection to it.

Mr. Mathewson: I want to call the Master's attention and counsel- attention to another point in connection with this examination. I stated that counsel might examine the books or by their representatives they might examine the books of the constituent companies making up the Consolidated Gas Company. We find after very careful search that the books of some of the companies are not in our possession. I am informed by Mr. Carter that all the books of these companies never were in the possession of the Consolidated except at one time, if at all, that was at the time of the investigation in 1886, when Mr. Yalden had them, and he is not sure that the Consolidated Gas Company had them then. It seems that the Metropolitan Gas Light Company officials and some other officials of these constituent companies in the progress of the consolidation had the books, and in searching our vaults we are unable to find some of them. For instance, the Mutual Gas Light Company's books, ledgers, journals and cash books cannot be found in our vaults. We are looking for them, and we don't know where they are. We would have supposed that we had them, but we have not evidently. The Knickerbocker Company's books, ledgers, journals, and cash books are also not in our possession. As to the New York Gas Light Company, and the Manhattan Gas Light Company, there are quite a number of books missing, such as the ledger of the New York Gas Light Company from February 1st, 1845, to July 1st, 1857. The other ledgers we find. The Manhattan Company ledger from 1845 to 1848 we do not find. We find the ledgers beginning with 1849.

The Master: I assume they do not want to go back any
3926 farther than that.

Mr. Mathewson: I don't know that they do, but I merely call their attention to the fact so they may determine in view of what they have introduced of Mr. Yalden's figures, which are made up by the examination of all these books, whether they think it is worth while to pursue fragmentary parts of the examination.

Mr. Burr: We wanted an opportunity to examine the Real Estate Account, that is all.

Mr. **Mathewson**: You cannot do it as to two of these companies unless we can succeed in finding the books. They are not in the vaults where all our books are kept, and Mr. Carter says he does not think the books of the Knickerbocker Company were ever in our possession, except as they were while Mr. Yalden was examining them. You can proceed with this fragmentary examination, but I call your attention to the fact, whether it is worth while in view of the facts that you have put in.

Mr. **Burr**: May we look at these books and also the books of the Consolidated Company showing real estate accounts?

Mr. **Mathewson**: You are looking at the books of the Consolidated Company containing the real estate account now, I think.

Mr. **Burr**: At all events it is clear in your mind that we are entitled——

Mr. **Mathewson**: You are looking at the books showing the accounts—I don't know about that, I don't know what you have examined there.

Mr. **Burr**: We are very anxious to look at the books of the Consolidated Gas Company containing the real estate account, also the books of the six original companies showing that account. If we cannot have all those books of the six constituent companies we would like those which are in the possession of the Consolidated Company and the right to examine all the books of the Consolidated Gas Company containing the real estate account. 3927

Mr. **Mathewson**: I do not think there is very much to that as far as the Consolidated Gas Company is concerned because the Consolidated Company has simply taken the appraised value of real estate in 1884 and the books show what it has added to, less what it has sold.

Mr. **Burr**: That should be a very simple matter.

The **Master**: Then that seems to be disposed of.

Mr. **Mathewson**: Supposing you tell your people to examine the real estate account so far as they can in the books of the constituent companies.

Mr. **Burr**: Very well. Have you a copy of that list?

Mr. **Mathewson**: Mr. Carter has.

George F. Sever resumed.

Mr. **Kirby**: I have no further questions of the witness.

Cross-examination by Mr. **Mathewson**:

Q. Professor, I suppose it is fair to assume that Ohm's law prevails in New York City as it does elsewhere and that the current of electricity if it comes in contact with two conductors will follow to a certain extent each conductor, is it not?

A. Yes.

Q. So that the mere fact that there is a conductor met by the current, which would be called an excellent conductor, and other conductors which are not so good would not prevent the escape of stray currents on these less good conductors?

A. No.

3928 Q. So that it is simply a question of the amount or the intensity of the current which escapes, is it not, in considering the transportation system in the City of New York?

A. Yes.

Q. A certain amount of electricity passing over an insulated conductor through the air perhaps, especially damp air, will escape into the air, will it not, so that you do not get at the end of your line the same power with which you stated?

A. Not with the systems that we have in the city.

Q. Do you carry to the end of your line the entire power with which you start or do you lose a part of it in progress?

A. A certain amount of the power is expended in heating the conductors over which the power is transmitted so that the translating device which you desire to operate does not receive all the power which is sent out from the power station.

Q. Take the subway for instance; are the return rails there insulated?

A. They are not intentionally insulated as is the third-rail.

Q. And will not a certain amount of the electricity under the recognized law escape from the rails and follow the other conductors in contiguity?

A. Yes.

Q. Would it not depend to a certain extent as to whether the supports of the rails were damp or not, as to the amount of electricity that would escape?

A. Yes.

Q. And is there not generally speaking always a certain amount of moisture or dampness in a soil like that of New York, which is not a sandy soil?

A. Yes, that is so.

Q. Speaking of the elevated road, you spoke of the other paths of return which were supplemented by an arrangement which you mentioned. What were the other paths of return which you had in mind and which you said were thus supplemented?

3929 A. The paths of the return of the elevated are service rails, the longitudinal girders of the structure and return feeders, copper return feeders connected to the structure and service rails to carry the current back to the negative bus at the sub-stations.

Q. Are the horizontal girders bonded together in the elevated structure do you know?

A. The longitudinal girders?

Q. Yes, the longitudinal girders?

A. Yes.

Q. They are bonded?

A. Yes.

Q. How about the other girders, are they in any way bonded to the longitudinal girders?

A. The transverse girders are not.

Q. And I suppose the same situation would apply to the elevated as to the subway, that a certain amount of current according to the recognized law would escape to the street, would it not?

A. Yes, I think it does.

Q. Do you know whether all the Edison neutral wires are grounded?

A. No, I do not.

Q. You spoke of the bridge from Brooklyn or the two bridges as introducing certain currents or opportunities for stray currents. Then we have the bridges, the surface roads, the elevated, and the subway; and will not the subway which is being constructed under the river to Brooklyn furnish further opportunities for disturbance, electrical disturbance, in the way of electrolysis perhaps, at least stray currents?

A. I think a certain amount of stray currents can be derived from that installation.

Q. What about the Union Railway which operated lines in the northern part of Manhattan, 135th Street, which is an overhead trolley road; wouldn't stray currents be likely to appear from that to a certain extent?

A. They certainly do.

Q. Is that a character of construction which is best qualified to prevent the escape of currents to the earth?

A. No, it is not.

3930 Q. There is not any return system there, is there, of an efficient character which you have described as to the service railways generally, that is the underground trolleys?

A. You mean as comparable with the subway, Manhattan and Metropolitan?

Q. Yes.

A. The return on the Union Railway system is not as good on these other three.

Q. The current returns through the ground there, does it not, to the point of starting, generally in the best way it can find.

A. It returns through the tracks and negative feeders.

Q. Now you have omitted one electric system that is in process of installation, which is the New York Central and the New York, New Haven & Hartford electric transportation system through the tunnel, which electric system, I understand, is to extend to Woodlawn or above. What would be the effect of the immense amount of electricity which will be employed in moving the heavy trains of those two roads from 42d Street up through the city?

A. It will be to introduce into the city another electric railway, the return current for which is to be very heavy and against which there will have to be precaution taken to prevent that current from going into the ground. They have service rails, heavily bonded and return feeders of large carrying capacity to handle this problem.

Q. Do you know whether they intend to employ the same method as is employed in the existing subways?

A. As to what?

Q. As to the return of current.

A. They ought to use lead covered return feeders placed in tile ducts and insulated as far as possible so that the lead sheaths will not be damaged from earth currents or stray currents.

Q. You know that other subways are designed and that the
3931 Rapid Transit Board is considering letting contracts for other
subways, don't you?

A. Yes.

Q. Well now, Professor, is it not a fact, that taking into consideration the operations of the trolley over the bridge, the new Williamsburg Bridge, and the current which may be observable in that connection and the new subway to Brooklyn which is not yet opened, and the contemplated subways and the New York Central and the New York, New Haven & Hartford electrical construction and the other electrical construction which is contemplated and which has very recently been put in, that the number and intensity of stray electric currents is likely to be increased as compared to what it was years ago?

A. There is no doubt about it, sir, unless there are very considerable precautions taken to keep this return current on the conductors of the railroad systems themselves, and if you will pardon me an interjection, I suggest we omit the New York, New Haven & Hartford system which is an alternating current system.

Q. Well, take the methods of return which are now employed, things as they stand; is it not true that the number and intensity of the electric currents which you would be likely to find now in the streets of New York would exceed by reason of these constructions, contemplated and at present, the currents a few years ago?

A. Yes, sir.

Q. And so far as they may have an effect by way of electrolysis, the danger would now be correspondingly greater would it not than it was a few years ago?

A. At the present time it is greater than it was some years ago.

Q. And other things being equal, the danger will tend to increase, will it not, with the duplication and addition of these various
other electrical constructions which are planned to be put
3932 through the streets of New York?

A. I do not think so if proper precaution is taken by these railway companies to maintain their systems in proper and up-to-date engineering condition.

Q. But is it not true that whatever precautions they may take, that in accordance with the law to which I have referred certain portions of the current will get into the street and the entire current will not follow the best conductor back to its starting point?

A. I cannot answer that question by either yes or no because either answer would negative the question.

Q. Give us your view?

A. That it would follow the best conductor back to the station, whatever it might be, but I think with the precautions that are now being taken and should be taken by the railroad companies, that the currents in the ground, or stray currents, will not develop to excessive proportions or extremely dangerous proportions.

Q. You would not mean by that that there might not damage occur in local sections where the soil or the contiguity of pipes rendered that favorable, would you?

A. There may be eventually and always will be certain local troubles.

Q. And you would expect the damage from electrolysis to be greater in present conditions than it was before there was any electric transportation system in the City of New York, would you not, as things now exist?

A. Yes, with all the current that is being generated by all the systems.

Q. Now, Mr. Simpson testified that pittings were observed in the mains of the company at one or two points contiguous to the Brooklyn Bridge and in that section, and that pittings had not been observed until recently there. Would it be probable that those pittings arose from the currents which were due to the operation of the electric system over the bridge?

A. Yes, I should imagine so.

3933 Q. Well, Professor, you expressed some views, did you not, at the International Electrical Congress in St. Louis in 1904 on the subject of the effect of currents of electricity in the City of New York?

A. Yes.

Q. And I will read what you are quoted to have said there and see if this accurately expresses your view. Page 688 of this volume.

Mr. KIRBY: What volume?

Mr. MATHEWSON: Volume III, printed volume.

Mr. KIRBY: Reports of the proceedings?

Mr. MATHEWSON: Yes, International Electrical Congress, St. Louis, 1904, it is endorsed. I am merely reading this because the Professor states it so much better than I could by any question that I think it will be much clearer.

"Professor SEVER: The data which we have collected contains many references to underground conductors other than piping systems, so that I think it is perfectly proper that that phase of the situation should be brought before this meeting. About two years ago when I became connected with the city government of New York, Mr. Jones brought me a cable sheath which he claimed was destroyed by electrolysis. I know that on some cable sheaths in New York City, both in the telephone and power circuits there are large currents coming presumably from the operation of the electric railways. In The Bronx there has been considerable difficulty. In the Borough of Manhattan there has been difficulty which to some extent has been remedied by the co-operation of the officials of the railway company and the telephone companies. I know of one instance where the sheaths were bonded at one point by a heavy copper conductor, to a return of the Manhattan L—approximately 1,500 amperes passed over that wire—sufficiently 3934 heated so one could not put his hand upon it—the Manhattan Elevated road uses its structure completely bonded, its service rails, and a large amount of return feeders, something like six or seven million cir. mils., to get their current back without causing trouble to their own or other conductors. In spite of all their precautions there are still thousands of amperes coming back on the cable sheaths as well as those of other companies. It has been brought to the attention of city officials for their recommendations as there are at times a higher potential than twenty-five volts between the ends of the line and the nearest substation, which is the maximum fixed by the city rules."

I assume that that still expresses the situation, does it not?

A. That is in regard to the Manhattan.

Q. So far as you referred to it?

A. Yes.

Q. When you say "in spite of all the precautions of the Manhattan L there are still thousands of amperes coming back on their cable sheaths as well as those of other companies," do you, or do you not, by "other companies" refer to the other companies having structures in the streets?

A. That is companies whose cable lines parallel the Manhattan L, or companies whose cable lines are connected to those parallel lines.

Q. Might that refer to gas pipes in the street?

A. Any subsurface structures would carry current in proportion to their conductivity.

Q. Have you ever yourself made any surveys to find out the electrolytic condition in New York City, and particularly the Borough of Manhattan?

A. Not in the Borough of Manhattan.

3935 Q. What did you mean exactly when you said that they had already commenced to put the Manhattan Elevated return system on the same basis as the subway?

A. I meant that they are putting in return feeders and insulating the sheaths of these return feeders carefully from the structure and service rails and insulating the negative bus in the substations, in the endeavor to keep the current on those return conductors and away from the ground; that is providing a better path than would be provided through the ground back to the structure and the substation.

Q. In speaking of feeders, you do not mean that the elevated has any return copper feeders back to the power houses in the usual sense in which feeders are understood, do you?

A. Yes.

Q. Have they return feeders of copper?

A. Yes, they have.

Q. Do you know to what extent, and how these feeders are connected and operated?

A. They are connected to the service rails at or near the substations, and taken back to the negative bus at the substations.

Q. Connected you mean at a single point?

A. Yes, at the substations.

Q. Is it not a fact that there is only a general connection between the structure and each substation, bringing back the return, is not that the only return feeder in the case of the elevated?

A. They have additional return copper in some sections besides this connection directly at the substation.

Q. Have you ever examined the continuity of the bonding of the girders to determine whether that was defective on the Ninth Avenue L for instance, due to the pin construction of the girders?

A. I have not examined it specifically.

Q. The elevated structure itself is not insulated from the ground, is it?

A. There is no definite insulation of the verticals or the
3936 uprights from the ground. The uprights are set in concrete,
on concrete foundations, which may or may not be insulators.

Q. It would depend somewhat, would it not, as to whether these bases were moist or dry?

A. Yes, sir.

Q. Well, do you know whether there have been any conferences between the elevated or the Edison Company and the city authorities as to conditions resulting from stray currents?

A. So far as the city is concerned officially, I know.

Q. You don't know that it has ever been officially brought to the attention of the Edison Company that their currents are the currents which may be doing damage, do you?

A. I don't know.

Q. Have you heard that there are differences of potential between the elevated railroad structure and the gas and water pipes and lead cables as great as 12 or 15 volts?

A. Yes, I do know that.

Q. Well, is not that a serious menace to those underground pipes?

A. It may or it may not be.

Q. Well, it might be, might it not?

A. It might be and it might not be. It is not a good thing to exist and from an engineering standpoint should be corrected.

Q. Well, don't you know that the currents are such that the telephone company has been obliged to connect or bond the lead sheaths of their cables to the elevated railroad sheaths and structures in order to protect their telephone cables?

A. Yes, that is so. They are doing it in a number of instances, their lead sheaths acting as part of the return conductor system for these railway currents.

Q. What would the necessity for such action indicate?

A. If they did not do that the current would leave their cable sheaths and eat up the lead and destroy their cables, and they make
this bonding simply as a self-protective device and endeavor
3937 to keep their lead cable sheaths insulated throughout the ducts
so the current will leave only at these predetermined points
of connection.

Q. And of course it must mean that there is some leakage of current, else they would not be obliged to do this to protect themselves?

A. That is very true.

Q. I suppose the gas pipes would be acted upon just as these sheaths of the telephone company, would they not, in the same location?

A. In a similar manner, providing the current went on through them in the same degree and left them in the same degree.

Q. Well, do you know what the copper capacity of the return circuit of the New York Edison Company is?

A. Of the return circuit in the New York Edison Company?

Q. Yes.

A. No, sir. I do not.

Q. Do you happen to know what current is carried by this neutral?

A. No, I do not.

Q. If the current carried back over this neutral is a minimum, and it is of large copper section, would not the drop on the neutral be exceedingly small?

A. I don't think I quite understand the question, sir.

Q. Well, if the current carried back over this neutral is small, and the neutral is of large copper section, would not the drop on the neutral be exceedingly small?

A. Yes, it would.

Q. Would you be surprised if you found it was only a mere fraction of one volt?

A. Why, no, I should not. I should think that was a wise precaution.

Q. Well, under such conditions and if there was only a mere fraction of a volt, and there being an almost perfect return path of high conductivity, would the tendency of currents to stray off be a minimum also?

A. Yes, the tendency would be a minimum.

3938 Q. Well, what is the basis of your suggestion, then, Professor, or perhaps your conjecture, that the Edison system is contributing to the electrolytic situation in the City of New York?

A. Only that if there is a considerable difference of potential between these larger separated neutrals, there would be currents flowing to equalize the potentials.

Q. Yes, if that be true, but if the conditions are such as I have indicated in my last question as to the minimum, then the contribution of the Edison Company to electrolysis would be very slight, would it not?

A. It undoubtedly would.

Redirect examination by Mr. Kirby:

Q. Mr. Mathewson has spoken of the installation now being put upon the lines of the New York Central and the New York, New Haven and Hartford Road, and you have stated that you are familiar with the installation which is being placed on such roads. In your opinion is there any great danger of stray currents from the power which would be furnished over this installation?

A. That is on the New York Central installation?

Q. The New York Central installation and the New York, New Haven and Hartford, both of which have been referred to?

A. I do not consider that in the case of the New York, New Haven and Hartford there is sufficient proof or evidence that there will be any trouble from the alternating current system. The plans developed for the handling of the return current on the New York

Central as at first made I feel are not sufficient to handle the return current, but this is now being modified so as to increase the capacity for taking care of this negative current and the endeavor being made to keep the stray currents out of the sub-surface conductors and off of the cable sheaths.

3939 Q. Ohm's law has been referred to and you have stated that no matter what the conductivity of the material might be so that it is a conductor, a certain proportion of the current will use that as a means of flowing from one point to another. This is true of a current of any intensity, is it not?

A. Yes.

Q. Whether the voltage be high or low?

A. Yes.

Q. And is it not a fact that the harm comes from the amount or intensity of the current rather than from the fact that a current of small or inappreciable amount happens to be on that conductor?

A. Will you read that question, please?

(Question read.)

The Witness: I am afraid I cannot answer that question. That is, the harm develops from the stray currents leaving these sub-surface conductors at some point, and the destruction would be directly as the quantity or intensity of the current.

Q. And if that current was of such a low intensity, as to be of a fraction of a volt or the amount flowing was of such a small amount as to be but a fraction of an ampere, the chances of harm would be very small, would they not?

A. Yes.

Q. So that because a delicate instrument would indicate a current, it does not follow that harm will result from that current?

A. Not if it remains in the sub-surface conductors themselves.

Q. And in electrolytic action we must have a voltage sufficient to set up such action in the electrolyte, whatever that might be, is not that so?

A. Yes.

Q. And that in most instances would mean a voltage of certainly more than one volt, would it not?

A. It has been found that it takes about two volts to electrolyze, that is dissassociate water, but so-called electrolytic action 3940 and subsequent chemical action may occur through smaller voltages.

Q. Would you say with a voltage of less than one volt?

A. In some soils where there is a great deal of salt, and saline matter, the electrolytic action might occur with one volt.

Q. Is it general that such is the case or is that an exception?

A. It is rather the exception and only in those places where the soil has a very low resistance due to these salts.

Q. Attention has been called to the subway return rails and the question has been asked you whether or not they were insulated. While they may not have been intentionally insulated, as a matter of fact, are they not practically insulated from the ground?

A. They are practically insulated from the ground for the voltages which exist between them and the ground. They are placed on wooden ties which are placed on the stone ballast, the latter being placed on the concrete bed of the subway, and the voltage existing between the service rails and the ground is comparatively small, so that this location of the rail is such as to afford a good insulation.

Q. The Union Railway, both in its length of line and in the amount of electricity generated as compared with the other electric roads in the city, has a very small amount of importance, has it not?

A. In the Borough of Manhattan, yes.

Q. Yes, that is what I had reference to?

A. Yes.

Q. An extract has been read from your report to the International Electrical Congress and your statement there in reference to the return of the current mainly had to do with the continuous lead sheaths of such cables for telephones, telegraph, or lighting or power purposes which were in the ground, had it not?

A. Yes.

3941 Q. And it is your testimony that if there be stray currents in the ground, such currents would follow such continuous paths, rather than water pipes and gas mains, which afforded it a more broken path, and a path of higher resistance?

Mr. Mathewson: Is not that all covered by the Ohm's law, that they follow the conductors in proportion to their resistance?

Mr. Kirby: I think my question is plain.

A. Yes.

Q. It has been stated that trouble has been found upon the cables of the Telephone Company and that from such cables conductors have been led for the purpose of carrying off that current and caring for it in a way which would prevent the destruction of such cables; also that the Edison Company by the use of a neutral wire of great size, and therefore large conductivity, would lessen the risk of any difference of potential between the neutral wires. Does this in any way confirm your opinion that the subject of stray currents and electrolytic action therefrom is better understood than formerly, and therefore the danger therefrom is less than formerly?

A. No, I do not think the danger is any less than formerly.

Q. Or is no greater than formerly? I am speaking of the future, Professor.

A. I think with the precautions that are being taken that the danger will be decreased and not increased, and those precautions are being taken and will have to be taken.

Recross-examination by Mr. Mathewson:

Q. You have said that the danger from electric currents or the danger from electrolysis was greater in soil containing saline matter than in other soil. Would not that danger be particularly
3942 present in the lower portions of the City of New York which have been filled in around the water front, and like Canal Street, which was formerly on the level with the river, and sections of that kind?

A. In places of that character the danger is greater, the opportunity for stray currents to produce results is greater.

Q. And where old buildings have been taken down and the mortar more or less mixes with the soil in connection with rebuilding, does not that give a reaction which is favorable to electrolysis?

A. Not so great as the saline locations, as the presence of lime is not so dangerous as salt.

Q. When you said that a current of electricity would follow the line of least resistance, that you do not intend to put in conflict with the Ohm's law, do you, that it will follow conductors, whatever they are, in proportion to resistance, universally?

A. It is exactly the same thing, sir.

Q. So that if there were two conductors in contact with a current of electricity, to put it in that way, the electricity would not all go to the best conductor, would it, or the current?

A. No, not at all, it would divide in proportion to their conductivities.

Q. Now, if it be true that heavy lead cable sheaths have been fused or heated to very high temperature, would not that indicate that thousands of amperes were being carried over the cable sheaths?

A. Yes, but not necessarily due to the stray currents.

Q. No, perhaps not.

A. It may be due to a number of reasons.

Q. That would indicate a large current of considerable intensity?

A. Unquestionably.

Q. And that, whatever its cause, would indicate a dangerous or serious condition, would it not?

A. It would indicate two serious conditions, one that there may be
stray currents there and one that those cable sheaths may
3943 have been burned off owing to some other fault on the line.

Mr. Mathewson: That is all.

Henry H. Edgerton, called as a witness in behalf of the defendant, the State of New York, being duly sworn, testified as follows:

Mr. Kirby: Mr. Master, I produce Mr. Edgerton here as a witness who will give testimony in reference to certain readings that he has taken in regard to the pressure of the gas in the service mains, also with reference to certain deductions which he as a gas engineer will make therefrom. It is our desire that Mr. Edgerton should give testimony upon other matters having to do with this case, that is in regard to the value of plant and the cost of making and distributing gas. But upon these two latter subjects we are not at this time prepared to produce his testimony, and I therefore ask that he be permitted to testify upon the first matter of pressure and that then we may be permitted to put on other witnesses before his testimony in regard to the value of plants; and this for the reason that as yet our engineers have not completed their examination of the inventory of the plants, and placed their values thereon. If there is any objection to proceeding in this way, I am afraid we cannot proceed with Mr. Edgerton.

Mr. Mathewson: Have you any other witness?

Mr. Kirby: I have not.

Mr. Mathewson: I don't know that I have any objection, provided you wind up with Mr. Edgerton on the subject of pressure and have that disposed of. 3944

Mr. Kirby: That is my purpose in bringing him here today. It was my feeling that if we could take this subject up by itself and end it as far as Mr. Edgerton is concerned now, it would save time. But I will qualify Mr. Edgerton as far as possible along all lines.

Direct examination by Mr. Kirby:

Q. Have you ever designed or built gas works?

A. Yes, sir.

Q. Where have you built such works and about when?

A. I built works in part in Fort Wayne, Ind., in 1868, 1869 and 1870, additions; built works on the west side of Chicago in 1871; Sunbury, Pa.; Middletown, Ohio, in 1871; Logansport, Ind., 1872; New Orleans, additions in 1872, 1873 and 1874; Mobile, Ala., 1874, 1875, 1876, additions; Shamokin, Pa., and Plymouth, Tamaqua, Montenoy City, Shenandoah——

Mr. Mathewson: Can you give the dates of these?

The Witness: Those were all in around about 1871, 1872 and 1873. I built those in partnership with Mr. Patton. I was not present at all the building of the works, but in part. I was consulted in regard to the building of the Mutual Gas Works in New York, or the changing it to an oil gas plant in 1872. Also Detroit, Mich., in 1872; addition to Memphis, Tenn.

Q. When was that?

A. Memphis, Tenn., in 1871 and 1872. That was the first works I had anything to do with in oil gas. It was then called naphtha gas. There are others I don't remember.

3945 Q. You have built works since that time, haven't you?

A. Oh, yes.

Q. Do you remember a few of the more important?

A. In 1882 I became connected with the U. G. Improvement Company as engineer and chemist; reconstructed the New Orleans Company—New Orleans Gas Works to water gas in 1882, 1883, 1884; Stamford, Connecticut, 1882; Danbury, Connecticut, 1879 and 1880; Wallingford, 1883; Pensacola, 1883; Waco, Texas, away back in 1874; Logansport, Indiana—I don't know whether I mentioned that——

Mr. Mathewson: Yes, you did.

Q. Any more recently than 1884?

A. Yes; in part; there was no construction of works by me entirely, I don't remember any, since 1884.

Q. Well, what works, if any, since that time were you associated with others in the construction of?

A. I was consulted in the construction of a number of works:

Omaha, Savannah, Reading, Pennsylvania, for the Reading Railroad Company, and also for the Reading Company. I don't remember much down here. In New Jersey, that is, Paterson. In Waterbury I did a little.

Q. Waterbury, Conn.?

A. Yes. That was in the case of the United Gas & Improvement Company's construction.

Q. In your work of designing or constructing these plants, did it in most instances include designs and construction of the distributing system as well?

A. In most cases.

Q. Have you ever operated any gas plants?

A. I have directly, officially, and also as consulting engineer in regard to them.

Q. What works have you operated officially?

A. I operated the Fort Wayne works from 1866 to 1871.

Q. What position did you occupy in those works?

3946 A. Secretary, superintendent and treasurer; I did everything there was about it.

Q. And thereafter did you directly operate any other works?

A. Not as an official. I assisted in operation by my advice in quite a number of works.

Q. What works did you as an advisory engineer or in an advisory capacity help to operate?

A. Mobile, Alabama; New Orleans, Chicago (West Side), and you might say the Mutual in New York City on several occasions; Detroit; Memphis. I now think I omitted to mention a number of works I built up in Minnesota—Faribault, Stillwater, and Red Wing. I again took charge of Faribault in 1901. I also omitted Asheville, North Carolina, and some connection with the Schenectady works also for the General Electric Company; that was in 1904.

By Mr. Mathewson:

Q. I do not understand what that relates to, whether operation of plant or construction, as to Faribault, Schenectady, Asheville?

A. Both, construction and operation. I may state from 1900 to 1905, I was consulted entirely by the General Electric Company for their works, various gas works.

By Mr. Kirby:

Q. Are you operating any gas works at the present time?

A. No. I am operating at Danbury. I am consulted in everything that is done there.

Q. Have you any official relationship with the company there?

A. No, sir.

Q. Simply acting in an advisory capacity to the company?

A. Yes.

Q. Have you ever made any special study of water gas, of oil gas and of oil as an enricher of gas?

A. I omitted to state in that where I acted in advising that I

3947 have also advised in connection with municipal works in regard to the several processes they use or used at one time in the operation of their works.

By Mr. **Mathewson**:

Q. Municipal of New York?
A. Municipal of New York, yes. I omitted that.

By Mr. **Kirby**:

Q. Now, in the main having completed the plants you were associated with in one way or another, will you answer the question that I just asked. The Stenographer will read it.

The **Stenographer** (Reading): "Have you ever made any special study of water gas, of oil gas and of oil as an enricher of gas?"

A. I have.
Q. Have you ever made any special study of the relationship between oil when used as in enricher and the candle-power resulting therefrom of gas oil and the kind and character of such oil as applied to the enriching of illuminating gas, both coal and water?
A. Yes.
Q. When did you commence to make such studies and what work did you do therein and thereafter?
A. When I was studying the use of petroleum products for use in gas making in 1870, using naphtha in the first instance, and as fast as any other product was obtainable, either cheaper or better for the purpose, I made a study of that also.
Q. Were you ever retained by engineers for the purpose of delivering lectures upon this subject or endeavoring to have water gas introduced into more general use, and if so, by whom and when?
A. I was engineer of the Gaslight Company of America for the period of 1874, 1875, and 1876, in the use of petroleum products for making gas, and being then new I was all over the country, interviewing gas managers on the subject and explaining the construction and operation of works; there was then a number of works in operation. I also appeared before the Board of Aldermen endeavoring to obtain franchises for the introduction of gas. 3948
Q. What was the Gaslight Company of America?
A. That was a company organized by the constructor of the Mutual gas plant and Mr. Thompson Dean for the purpose of further utilizing petroleum products for gas making.
Q. Who was the constructor of the Mutual?
A. Hoyt Kennedy & Company.
Q. You were retained by Mr. Kennedy for this work?
A. Yes. Mr. Kennedy was president of the Mutual Company.
Q. Did you have anything to do with the preparation of plans for the introduction of water gas in the Mutual Company's works?
A. I examined all their plans. The works were originally built for coal gas and it became a question of the best method of changing them to the use of naphtha and I came on here to New York and

spent several months in consultation on that subject with Mr. Kennedy.

Q. Did you have anything to do with the installation of the water gas part of that plant?

A. That was not really a water gas plant as first started. It was what we called a naphtha gas plant.

By Mr. MATHEWSON:

A. At the Mutual?

A. Yes, naphtha and coal gas mixed. I think Mr. Kennedy depended entirely on my previous experience and judgment in regard to starting that thing up.

3949 By Mr. KIRBY:

Q. You did not actually instal any of the apparatus yourself?

A. No, I was not contractor; simply consulted in regard to it.

Q. Have you ever examined gas works?

A. I may say that I induced Mr. Kennedy in the first place—my report induced Mr. Kennedy to put in a change from coal gas to naphtha gas.

Q. Did he so state to you?

A. Yes, sir.

Mr. MATHEWSON: I don't think that is very material. The Mutual is not one of the consolidated companies, anyway.

Mr. KIRBY: It is simply a question of qualifications.

Q. Have you ever made any examination of gas plants elsewhere than in the United States?

A. Yes; in Europe, in 1860, '61, '62 and '63 I examined quite a number of plants. In fact I went to Europe for the purpose of looking into the gas business and also went into chemical subjects.

Q. Well, in England what works did you examine?

A. I went first to Liverpool and became acquainted with Mr. King. Mr. King gave me letters to various parties and I went to London and spent a little time there, endeavoring to find out in what particulars we were behind in this country in regard to operation of gas works, and I had been previously employed for two years in the operation of works in this country before I went to Europe, that is why I became interested in the subject in the first place.

Q. Since that time have you made any examination of plants elsewhere than in the United States?

A. No, I have not seen any.

Q. Have you kept familiar with the reports of foreign countries and their method of operation?

3950 A. I have taken the journals devoted to the gas business and looked over those, both French and English, sometimes in German, and I have kept generally posted in regard to their movements and secured plans from time to time of their improvements.

Q. Have you read and are you familiar with the English statutes in regard to gas companies?

A. Reasonably so, yes, sir.

Q. And of the analysis of their accounts, such as set down in Field's Analysis or other analyses?

A. Yes, I have made a special study of gas accounts, in fact took the accounts of a number of works.

Q. What do you mean by "took" the accounts of a number of works?

A. Well, I got adopted the Fort Wayne system of accounting, which was considered a very good model, in Mobile, and partly in New Orleans, and in most all the works I constructed afterwards and had anything to do with operating, unified the accounts somewhat to that system.

Q. Have you ever pursued studies at any scientific school while abroad?

A. I wasn't there long enough to take a course in any school but from the American Legation I secured admission to lectures at *l'Ecole des Mines, l'Ecole Central, l'Ecole des Ponts et Chausses.*

Q. All of them are located in Paris?

A. Yes, very near together.

Q. What sort of studies did you pursue at these schools?

A. I merely attended lectures from time to time and became acquainted with Professor De Ville and a number of other scientific men and according to their advice I went from town to town as a matter of interest turned up.

Q. Did you make any special scientific investigations under Professor De Ville?

A. I was at Vesuvius when he studied the gases there, at the volcanic eruption of 1861, I think it was 1861 or 1862. It was
3951 a study of gases, which run into one another; it is all along the same line.

Q. And you are familiar with the chemical and physical constitents of gas?

A. Yes, and the analysis of gas, and devised apparatus and made it a life study.

Q. Are you familiar with scientific apparatus such as used for photometry and the measure of pressures in gases?

A. Yes, sir.

Q. Have you made frequent use of such apparatus?

A. I used it in its best forms for probably forty years.

Q. Are you familiar with the different kind of gas burners used by Professor Hallock in the experiments about which he has testified in this action?

A. Yes.

Q. Have you made experiments from time to time to ascertain the pressure at the burner tip which would give the highest illuminating fficiency of the flame?

A. Yes.

Q. Have you made experiments from time to time to ascertain the pressure required at the point of issue of gas and gas burning apparatus for heating, cooking, etc.?

A. Yes, sir, I have.

Q. You have seen the results of Professor Hallock and heard his testimony thereon. Do the results which he has obtained coincide in the main with the results of your experiments and investigations?

Mr. MATHEWSON: Objected to, as too general. I think he should ask a specific question, so that I can cross-examine him. I do not think there is any such practice as that of asking if you heard a witness testify and if you agree with his general conclusions.

The MASTER: Not if there is objection to it, Mr. Kirby.

Mr. KIRBY: Well, we will come to it later.

3952 Q. Have you read and are you familiar with Section 2 of Chapter 125 of the Laws of 1906, being an act in relation to illuminating gas in the City of New York, etc.?

A. I don't remember it by sections.

Q. Expressly that part thereof reading:

"The pressure of illuminating gas in any service mains in said city at any distance from the place of manufacture shall not be less than one inch nor more than two and one-half inches."

A. Yes, I read that. I did not remember the section.

Q. What is your interpretation of the words "service mains" as set down in such statute?

Objected to; the witness's interpretation of a statute.

Q. What to your mind as a- engineer and one who has had to do with the operation, management, designing and building of gas works do the words "service mains" mean?

Mr. MATHEWSON: Same objection. I think the witness can state what kind of mains he tackled in his experiments but I do not think he can testify as to what the statute means.

Mr. KIRBY: I think he is competent to do that. I think it is a relevant and material question.

Mr. MATHEWSON: Objected to on the ground it is his construction of the statute and not competent.

The MASTER: He cannot construe a statute but it is proper for Mr. Kirby to ask him as an expert in the gas business what
3953 the term "service mains" means. If it has any meaning in the gas business show it by him.

Mr. KIRBY: I will so ask him.

The WITNESS: Well, it is a new term that I thought rather an apt term, I propose to adopt it hereafter for I take it to mean the mains——

Mr. MATHEWSON: I object to what you take it to mean. That is not the question. The question is what in the gas business "service main" means, in your experience.

By Mr. KIRBY:

Q. What do you understand that term to mean?

Mr. MATHEWSON: No, I object to what he understands that term to mean if he refers to the statute. The witness is limited to the question which the Master ruled was proper.

Mr. KIRBY: Let the witness go on and complete his answer. He said, "I take it to mean——" Now, what do you take it to mean?

Mr. MATHEWSON: Do you mean what does he take that term to mean, as used in the statute?

Mr. KIRBY: I mean what does he take that term to mean in reply to the question which was put to him?

The MASTER: He was asked to testify what it means in the gas business. If he says it is a new term and then you ask him what he takes it to mean, it virtually amounts to the same thing as your former question, does it not?

Mr. KIRBY: I think not. Answer this question, Mr. Edgerton.

Q. What, in your opinion, do the words "service mains" mean in the gas business?

A. The mains to which service pipes are attached.

3954 Q. Have you made tests and ascertained the pressure of illuminating gas furnished in the Island of Manhattan at various points thereon?

A. I have.

Q. Were the points of observation that you selected at different elevations above the sea level, at different distances from gas holders or holders supplying the gas?

A. I observed at those points I thought likely to give the greatest difference of pressure, the highest point and the lowest point and those most remote as well as a few nearer the works. I have not made as complete a study as I should like.

Q. You have taken these readings right up to the present time, have you not?

A. Up to last Friday was the last I think I took.

Q. Where these pressures were not recorded as being the pressure in the service mains as defined by you, have you made a calculation therefrom or an approximation thereof so as to ascertain what the pressure in the service mains would be?

A. I put the apparatus generally on the services that were not in use at the time, or I instructed the parties not to turn on the gas while the machine was in use or in some places where they used electricity for lighting and had gas merely to back it up, as it were.

Q. And in all these readings, you are prepared to state what in your opinion the pressure would be in the service mains?

A. Yes, sir.

Q. From which the gas is drawn which you used in the experiments?

A. Yes.

Q. Will you describe the apparatus with which you took your pressure readings, and if you have such apparatus with you you may produce it and describe it therefrom.

3955 Mr. MATHEWSON: May I ask the witness if he made these pressure tests with the same apparatus at every place?

The WITNESS: I had two machines so as to take it at one point and take it the same evening at another point so as to connect them.

(The witness produces a machine.)

Q. Now, the name of this machine is what?

A. The Richards Brothers Recording Manometer. The operation of it is just simply——

Q. In your description say what the various things are so that we won't have to put this in as an exhibit.

A. The machine consists essentially of a cylinder about four inches in diameter and six inches high, operated by clock work. On this cylinder is placed a paper ruled in millimetrical lines and a pen is made to traverse on the sheet of paper, the pen being operated by the pressure of the gas, the pressure of the gas communicated to the pen by a diaphragm to which is attached various mechanical devices for transmitting the motion of the diaphragm to the pen.

Q. I notice this chart is ruled in curved lines. Why are those lines not straight?

A. That is owing to the fact that in order to get great sensitiveness of movement the lever holding the pen is operated on very delicate centres and this circular movement of the pen is due to operating from a centre instead of vertically up and down. The clock work of cylinder is arranged to revolve the cylinder once in twenty-four hours thereby giving a continuous reading for a day. The apparatus is sensitive when properly adjusted to about 1-100th of an inch pressure. I have compared this instrument with the absolute column of water *guage* and find it to be perfectly accurate.

3956 Q. And this is an instrument you have used in the experiments?

A. Yes. and one like it; two of the same description.

Q. And you have compared the other instrument to ascertain whether or not it is correct?

A. Yes, I compared it with this one also.

Q. And is that also, in your opinion, correct and in perfect adjustment?

A. Yes, sir.

Mr. Kirby: As it is now one o'clock and I am next to take up about twenty-five of these charts and give the readings from them I think we might take a recess now for lunch.

Mr. Burr: Before we do that I wish to state that Mr. Marks and the head accountant representing Marwick, Mitchell & Company are here from the office of the Consolidated Gas Company and report to me that Mr. Carter refuses to allow them to examine the real estate account as I thought I had understood with Mr. Mathewson this morning before we began that they might. Mr. Carter is also here and I would like to have that matter straightened out.

Mr. Mathewson: Suppose you strike that statement off the record. Mr. Carter and I understood Mr. Marks came here for the express purpose of arranging the matter now.

Mr. Burr: There is no use of arranging it privately unless it is finally understood. I want it on the record. We want to know whether we are going to have this account.

The Master: If there is going to be any more of this discussion back and forth of what has or what has not been refused or permitted I do not care to have it taken on the record because it makes it unnecessarily cumbersome. If you gentlemen cannot agree, each side place its position in writing, submit it to me outside of 3957 this record and I will decide it. But it is an unnecessary waste of time to have discussions as to whether Doctor Marks has or has not been allowed to get all he wants.

Mr. BURR: I fully agree with you. The statement made by Mr. Mathewson was very plain this morning and I thought there was no difficulty in examining the books of the Consolidated with regard to the real estate account.

Mr. MATHEWSON: The real estate account is ready for examination and Mr. Carter has prepared a transcript so as to facilitate your checking of the real estate account. Mr. Carter says the statement of counsel is an absolute misstatement—a mistaken statement of the facts. There has been no such refusal.

Recess until 2.15 p. m.

After Recess.

HENRY H. EDGERTON resumed.

By Mr. KIRBY:

Q. Mr. Edgerton, the experiments or readings which you made upon the pressure of the gas in the manner you have indicated were made upon the instrument you have described and upon a certain chart or diagram placed thereon. I hand you such a chart as is used upon this instrument and ask you if you will describe it, that is what the division of the line means and what the standard is, that is whetner in inches or meters.

A. The charts are in millimeters, but I have ruled a 2½-inch line and also a 1-inch line from the zero point in order to show 3958 the pressure relative to the Act.

Q. I notice that on these charts in some instances you have drawn a line shortly above that on the chart marked zero. Why did you draw such a line?

A. In the use of this instrument it is better to make a fresh zero at every point where the pressure chart is taken for the reason it does not always coincide with the zero of the chart, and for that reason in placing the instrument in position I always make a fresh zero mark to measure from, it being easier to do that than it is to regulate the hand back to zero.

Q. Now you have drawn a line above that which we will call the true zero line, being somewheres around the line indicated by the figure 30 on the diagram.

A. Yes.

Q. What does that line indicate?

A. That indicates the inch line measured from zero.

Q. Now you have drawn another line, still further above this one close to where the line indicated on the chart as 70 is drawn. What does this top line indicate?

A. The top is the 2½-inch line.

Q. Now I notice that at the top of these various diagrams names, such as Columbia University, and so forth, appear. What does that indicate?

A. That indicates the point where the pressure sheet was taken.

Q. And thereafter a date. What does that indicate?

A. The date upon which it was taken, that is the date upon which the registration commenced. It ends off at a day later.

Q. I also notice certain designations such as 3 p. m., 9 p. m. and so forth along the top of the chart. What does that indicate?

A. That indicates the hours of the day and night.

Q. And to find the pressure at any such hour or any intermediate period between the hours you would trace the curved vertical
3959 line down to a point where it intersects the broken line, the line as registered, and read pressure, the pressure in the horizontal lines which would show fractions of an inch. Is that the way you would so use the chart?

A. It shows fractions of a millimeter and can be readily converted into inches. I will add that these charts are all the natural scale, that is, they are on the scale of actual inches, the instrument is so arranged as to show inches and millimeters on the actual scale of inches and millimeters.

Q. In other words, in measuring the pressure either in inches or millimeters you would measure on the curved vertical line instead of on the chord of that curve, which would be a straight line?

A. Yes.

Mr. Kirby: Now, I might state that I am going to ask Mr. Edgerton to describe these charts and that these are all of the charts which he took. In other words, they run chronologically except on such days that he did not take them. In other words, there are no bad ones left out and merely good ones put in.

Q. I show you a chart which is headed Columbia University and dated October 5, 1906, and ask you to state where this was taken and under what circumstances and to take the readings from the time the instrument was started in operation and carry them through for the twenty-four hours giving us in a few words the result of that reading?

A. The first chart in question started October 5, 1906, at Columbia University, in 116th Street, at 3 P. M.

Q. Where was the instrument placed, in what part of the University?

A. In Room 206.

Q. What place is that?

A. It was on the Amsterdam Avenue side, about ten feet above the street level at the point where it is taken.

3960 Q. What did you attach the instrument to, how did you attach it?

A. I attached it to a pipe isolated for the purpose, and so far as I could see no other consumption on the pipe and made sure that the instrument was in perfect adjustment as regards zero and then I compared it with a water pressure gauge to see that it indicated the pressure when it was turned, that it indicated the same point as on the water gauge in comparison, and then having previously wound it up, let it go on its course indicating the pressures as they *are* progressed.

Q. Do you know approximately how high this point is above sea level?

A. From information from Professor Hallock, who told me it was about 150 feet above. I have not had a chance to verify that.

Q. Now, will you take the chart from the beginning.

A. It shows that at 3 P. M. the pressure was, as indicated here, 63 millimeters from zero or 61 millimeters from the instrumental zero. Its pressure continued substantially at that until the hour of 5 P. M. when the pressure began to fall on account of the consumption of gas in that neighborhood. I notice that at the hour of 4:45 they commenced to put the pressure on the governor at the holder as indicated by these vertical lines, lines there, which shows where the man put the weights on the governor and at an interval of fifteen minutes he put on another weight. The pressure still falls until 6:20.

Mr. Mathewson: These weights are for the purpose of increasing pressure?

The Witness: Increasing pressure, but the pressure falls notwithstanding until about 6:20. Then the pressure rises quite rapidly until at 7:30 it has reached the 2½ inch line. It is then continued slightly above that line.

3961 Q. What do you mean by slightly, about how much in inches?

A. About 1-10th of an inch above the line until——

Q. And from time to time dipping down?

A. And from time to time dipping down below the line until 2 o'clock in the morning when it reaches the 2½ inch line and remains at that until about lighting time in the morning, that is 3:30, they put on pressure again for the morning hour lighting, and that sent it up to 1-10th inch above the line and the consumption again reduces it until 7 o'clock when the pressure is reduced for daylight and comes down below the line about 2-10ths of an inch and continues on with slight variations until 3 o'clock in the afternoon.

Q. When you say it comes down below the line you mean the line indicating pressure, the 2½ inches?

A. 2½ inches.

Q. And that is what happened on October 5th at Columbia University in the place you indicate.

A. Yes.

Mr. Kirby: I offer this in evidence.

Chart received and marked State's Exhibit JJ-1.

Q. The next test you have at Columbia University is October 9th, 1906. Was this taken at the same place?

A. Same place and under the same conditions.

Q. And will you in the same way describe the results as indicated by that test and make your description in tenths of an inch if it is convenient for you to do so. What time did this test start?

A. This test starts at 9:30 A. M. The pressure remained below the 2½ inch line with slight variations until the time of lighting up and putting on of the governor, attaining its lowest point at 3962 5:30 P. M., being at that point 21-10ths of an inch and the pressure rises then gradually until 7:30 when it has attained 2 and 6-10ths, remaining at that until 11:30 P. M. when the weight is taken off the governor reducing the pressure to about 2½ inches, at which pressure it continues until 4:30 in the morning, the same as on the previous day. A slight pressure was put on at the governor at 4:45 in the morning and kept on until about 6:30, the lowest pressure of the night being 2 and 4-10ths and the highest 2 and 7-10ths.

Mr. **Kirby**: I offer this in evidence.

Chart received and marked State's Exhibit JJ-2.

Q. The next test you took at the university was one on October 11, but inasmuch as that is to be put in in comparison with another, we will take up the test on October 13th, if you will?

A. On October 13th the test was put on at 9 a. m., but it seems either from not having been properly inked or for some reason the registration does not start until 11:45. This chart presents the same characteristics as the former, attaining its lowest point at 5:45, two and two-tenths inches, and then rising until the highest point during the night at 10 p. m., of two and seven-tenths, the average height being slightly greater than the previous charts.

Q. By "slightly," what do you mean, one-tenth of an inch?

A. About 15-100ths of an inch, I should say on an average. The maximum would be two-tenths.

Q. Now, on October 14th you took a further test at the University, didn't you?

A. October 14th, it was put on at 9 a. m. and presents the pressure remaining below the two and one-half inch line until 2 o'clock.

3963 Q. Does this chart show any material deviation from the indication set forth in the one of October 13th?

A. No, practically the same, only with slightly less variation. It seems as if there was less consumption on the mains during that day. Was that Sunday?

Q. Yes.

A. That accounts for it, being Sunday, showing less variation than there was during the weekdays.

Q. On October 15th, we have another chart. Does that show any material difference from the ones of October 13th and 14th?

A. The only noticeable difference is that it is carried at the lower pressure, it does not rise above the two and one-half inch line except for a short period and this for a distance of one-tenth of an inch.

Q. And October 16th we have another test; wherein does that differ from the others, if at all?

A. The same as the 15th except slightly greater pressure at night, rising two-tenths of an inch above the two and one-half inch line.

Q. And on October 17th you have another test. Does that differ in any material point, and if so, where?

A. No difference except the instrument appears to have been off during half an hour for some change of connection, it states.

Mr. MATHEWSON: What states?

The WITNESS: The chart.

Q. You have noted upon the chart where no indication is given of the pressure, that is due to some change you made in the connection of the instrument?

A. Yes, putting on some photometric apparatus, probably.

Q. What time of the day was that?

A. That would be at 1:15 and lasts until 1:45.

Q. But other than that.

3964 A. There is no essential difference. The maximums are a little greater, perhaps one-twentieth of an inch, than the previous one.

Q. You have another test for the same place on October 18th. Does that indicate any essential difference from the other reading?

A. None whatever except the maxima are almost all between the two and one-half inch lines. They exceeded only in one or two instances.

Q. And by how much and for how long?

A. One-half of a tenth of an inch for a period of half to three-quarters of an hour.

Q. Another reading was made on October 19th?

A. On October 19th it is kept below the two and one-half inch line with the exception at night about 10 P. M. it was about one-fiftieth of an inch above the two and one-half inch line.

Q. On October 20th you have another reading. What does that indicate?

A. It is wholly below the two and one-half inch line day and night.

Q. And October 21st?

A. It is all below the two and one-half inch line.

Q. And in no instance on October 20th as low as what?

A. In no instance lower than two inches.

Q. And on the 21st, no instance as low as what?

A. As low as two and one-quarter. The 21st seems to be another Sunday.

Q. On the 22d what do we find?

A. On the 22d we seem to have another holder in connection with that supply during the daytime and it is substantially below the two and one-half inch line.

Q. And a great many trivial variations?

A. Yes, showing the vacillations of the governor.

By Mr. MATHEWSON:

Q. What do you mean by saying they seem to have another holder?

3965 A. Well, you see the difference between the 21st and 22d in the daytime is very noticeable. It looks to me as if—and I am pretty sure, too—that on the 22d there was some other governor than previously used because there is a continued vibration of governor there.

Q. And that is a deduction you make from looking at the chart?

A. Yes.

Q. You can see by comparing this one with the other?

By Mr. KIRBY:

Q. Now, on the 24th you made another reading. What does that indicate?

A. It is all below the two and one-half inch line except a short period, a period of four hours during the night when it might have exceeded it by a twentieth of an inch on the average; it being a change every quarter of an hour there looks as if some one was attempting a valve regulation and probably it is, for I do not see that the governor regulations should vary in that manner. You notice that almost all these variations occur at intervals of just a quarter of an hour.

Q. Now, on October 24 there is another reading?

A. All below the two and one-half inch line till 7 P. M. when it rises slightly above it until 12 P. M. and then the pressure is reduced and the average is about on the line until 7 A. M., when it descends below.

Q. On October 25th?

A. The registration in this case is all below the two and one-half inch line until 7 P. M. when it rises above and until 12 and then averages on the line during the rest of the night.

Q. I notice this chart is not marked with the hours of the day. When did you start to take your readings?

A. I see that has been omitted in this chart, but I judge from the lowest point being 5 o'clock, as it corresponds with the rest,
3966 that seems to be the hour—no, 6 o'clock, I should say, that seems to be the point where the lowest readings occur there.

Q. It would indicate the peak of the load——

A. It indicates that the peak of the load in that district——

Q. And that point corresponds with the 6 p. m. in the other charts?

A. Yes.

Q. So you would judge that this was commenced as they are at 9 p. m.?

A. Yes.

Q. You made another reading on October 26th. When did you commence on that day?

A. Nine a. m. This chart is somewhat different from the other one, for at various periods during the daytime we filled a small gas holder with gas and it is indicated on the chart by a lowering of about tenths on the pressure. After the minimum was obtained, which was at 6 o'clock, amounting to 2-inch pressure or 20-10ths, the registration remained at the 2 and 1-2 inch line during the rest of the day and night.

Q. Now the comparatively large decrease in pressure as indicated on these charts by the use of a gasometer in drawing off gas for the experiments, which I presume were those of Professor Hallock, would indicate to you, would it not, that there were no other burners or other sources of escapes of gas from the pipe to which you attached your apparatus?

A. Yes, I know there was nothing going on on the pipe, because I examined into that and there was nothing. Also when we turned on the gas holder, it shows here by the dropping that would amount possibly to three or four burners, not more than that, because it was very slow filling. There was nothing else on in the building.

Q. By gas holder you mean the holder——

A. The gas prover.

M-. KIRBY: I offer these charts in evidence.

3967 The charts were received in evidence and marked State's Exhibits JJ-3, JJ-4, JJ-5, JJ-6, JJ-7, JJ-8, JJ-9, JJ-10, JJ-11, JJ-12, JJ-13, JJ-14, JJ-15, JJ-16.

Q. On October 11th you also took readings at Columbia University, did you not?

A. Yes, sir.

Q. On the same day did you take readings at a place known as Columbia Printing House, No. 386 West 125th Street?

A. Yes.

Q. Is 386 West 125th Street at a lower elevation than the point in Columbia University where you took the other readings?

A. Yes, it is about as low a point as I could find on that street.

Q. I understand then it is your best information that Columbia University obtained this gas from the Consolidated Gas Company or that the meter is so marked?

A. Yes.

Q. The gas furnished at the Columbia Printing House is how metered?

A. That man's bill is from the Standard Gas Light Company, but the mains are connected there so they show essentially the same. It is the same gas holder which supplies both, or did at that time.

Q. You have read the testimony here to the effect that the mains are interlocked——

MR. MATHEWSON: No, they are not. That is where you make a mistake. There is no testimony of that sort except that we procure a certain amount of gas from the Standard Gas Light Company under agency agreement and where it is delivered to our main it interlocks in that sense, but there is no interlocking of the Consolidated Gas Company and the Standard mains, you understand that, Mr. Edgerton?

The WITNESS: Yes, I see. I am only struck with——

3968 Q. Wait a moment, we will come to that. Now the chart taken at Columbia University has the same general character as those others which have been placed in evidence and which are marked State's Exhibit JJ-1 and so forth, has it not?

A. Yes.

Q. And the chart taken at 386 West 125th Street shows what in itself and also shows what in comparison with the chart taken at the same time at Columbia University?

Mr. Mathewson: The Master will observe that this 125th Street place is the Standard Gas Company, while at Columbia College it is the Consolidated Gas Company meter, so that what the comparison may be worth I do not quite see. I have no objection to its being put in however.

Mr. Kirby: I pointed out that distinction myself and I wanted to be perfectly fair, but I think you will see the relevancy and importance as this develops.

A. At the bottom of the hill there is a loss of pressure compared with the top of about half an inch during the daytime. When you come to the lighting time, this Columbia Printing House put on one burner and reduced the pressure to 1 and 1-10th inches. Then at 6.20 they put on another burner and reduced the pressure to 7-10ths.

Q. That is the pressure at the point where your instrument was connected and where you took your reading?

A. Yes. And at 8 P. M. it seems his light was turned out and the pressure went back to the normal which is 2 inches and continued along at 2 inches until about 5:45 A. M., when some change was made in the regulation of the gas at the holder which caused it to jump up temporarily to 2¼ inches and it immediately fell back again to 2 inches. 3969

Q. Now, will you take the chart taken at 125th Street at the bottom of the hill and the chart taken at Columbia University at the top of the hill and interpose one upon the other.

A. (Witness does as requested.) I will show you that this gas came from the same place. You cannot see it except by putting it upon the glass, but every movement of the gas holder or the gas in the mains between that Consolidated Gas Company consumer at the top of the hill and the Standard consumer at the bottom are identical.

Q. In other words, the variations in pressure as shown on the chart taken at Columbia University correspond with the variations in pressure taken at the printing office at the bottom of the hill on 125th Street?

A. Except that the average pressure at the bottom of the hill was three-quarters of an inch less than at the top.

Q. And what was the minimum pressure at the bottom of the hill?

A. The minimum pressure on the main was two inches.

By Mr. Mathewson:

Q. At the bottom of the hill?

A. At the bottom of the hill.

Q. Seven-tenths, wasn't it?

A. That was when it was burning.

Q. But we are talking about that whole chart?

A. I thought you were speaking about the pressure on the main.

By Mr. Kirby:

Q. And this seven-tenths of an inch which Mr. Mathewson refers to shows a pressure at what point and due to what in your opinion?

3970 A. The drop in pressure due to the man lighting up his burners. He lit up one burner and it drew it down to one and one-tenth inches and the second burner drew it down to about seven-tenths of an inch.

Q. Drew it down where you had your instrument placed?

A. Yes.

Q. Where was that?

A. That was in the back of his shop not more than twenty feet from the meter.

Mr. KIRBY: I offer those two charts in evidence.

Charts received and marked State's Exhibits KK-1 and KK-2.

Q. Now, on October 12th you took comparative readings at the same places, didn't you?

A. Same places. They are the same general character and almost identical except I arranged with the man not to turn on the gas at night.

Q. Arranged with man where?

A. With the proprietor of the Columbia Printing House not to use the gas that evening so I could get a perfect record to compare with the top of the hill.

Q. So that these two charts show the pressure with no gas being used either at the University or the printing house from the service pipe to which you had your instrument attached. Is that so?

A. That is so. No interference with the registration by the use of gas.

Q. Do these charts show the same minute variations in pressure at both the University and the printing house through the hours at which the readings were taken?

Mr. MATHEWSON: Whether they do or not, it does not seem to me——

A. No. There were different holders on them. They were supplied from different sources.

3971 Q. In the reading taken at the bottom of the hill, what was the pressure variation during the twenty-four hours?

A. The greatest pressure variation in twenty-four hours at the bottom of the hill was three-tenths of an inch at 5:30.

Q. Three-tenths of an inch, what do you mean by that?

A. Three-tenths of an inch water pressure, a column of water.

Q. In other words, was it below one inch?

A. No. I understood you to say the variation.

Q. And what was the minimum?

A. One and seven-tenths inches.

Q What was the maximum?

A. Two inches.

Mr. KIRBY: I offer those two charts in evidence.

Charts received and marked State's Exhibits LL-1 and LL-2.

Q. Now, in addition to these tests which you have testified to, you took readings in various other parts of the country, didn't you?

A. Yes, sir.

Q. Did you make a test at the Grand Union Hotel on August 18th?

A. Yes; August 17th and 18th.

Q. What does that show in a general way, without going into minute deviations?

A. Well, it shows at 7:15 they put on a pressure of three-quarters of an inch at the works and continued it along until 10 o'clock and then at intervals of half an hour they diminished the pressure by .2 until 12 o'clock when it came to the lowest point, then the pressure continued along very evenly, a very fine regulation, until 6 o'clock in the morning and throughout the day; very excellent regulation.

Q. Now, on October 15th, did you take a reading at 3607 Broadway on the fifth floor of that apartment house?

A. Yes. This sheet was one put on by Professor Hallock and handed to me.

3972 Q. That runs through into the 14th, does it not?

A. Yes, Saturday and Sunday, the 13th and 14th of October. This, as I understand it, is considerably higher than Columbia.

By Mr. MATHEWSON:

Q. Where is that?

A. 3607 Broadway, the fifth floor of the house.

By Mr. KIRBY:

Q. How high up is the fifth floor? Have you made any measurements thereof?

A. I did not get a chance to measure that yet.

Q. That shows a variance above and below the maximum of 2½ inches?

A. 2½ inches just about fills the bill.

Q. By "fills the bill," you mean——

A. There is a full variation.

Q. That would be the average that the R points upon that, where it goes above the maximum?

A. Yes.

Q. On October 15th, did you take a reading at No. 1 Platt Street?

A. Yes. That was put on at 5:15 and obtained the pressure of two inches and the minimum pressure was 1.7 obtained at 5:45, maximum 2.4, running until morning with a slight variation.

Q. There is no point in that. Did the maximum rise above two and one-half inches?

A. No, sir.

Q. And at the highest of all points it was above two inches?

A. Yes, sir.

Q. You took another reading at No. 1 Platt Street on October 16th, did you not?

A. Yes, same character as the previous except in the morning a gas engine—in the morning at 8 o'clock a gas engine appears to have been started up in the vicinity and caused a vibration during the day.

3973 Q. But the pressures are still within the two and one-half inch maximum and do not fall below two inches except at one point when it fell two——

A. .16 of an inch.

Q. Now, on October 17th and 18th, you took certain readings at No. 2B Platt Street?

A. That is a consolidated meter there, I was uncertain about that other point.

Q. And what does that show?

A. That shows a general average of two inches, nowhere reaching the two and one-half inch line or getting below one and one-half inch. The water in the main shown at the time of the greatest consumption appears to be a chunk of water there which interferes with things. So I investigated in the neighborhood and I found that the consolidated pipes had water in, very much interfering with the light, and it extended for several blocks.

Q. Now, you took a reading on October 30th, did you not, at 11th Avenue and 50th Street?

A. Yes.

Q. How much does that show?

A. That shows a general average of two inches and a minimum of 1.1 at 6 P. M.

Q. At that point not falling below two inches?

A. Not below two.

Q. And having a maximum not greater than how much?

A. Than two inches.

Q. A maximum of 2.1, isn't it?

A. No, two inches.

Q. Being practically a consonant except for the peak point at 6 P. M.?

A. Yes. This diagram shows a peculiarity; there was a gas engine running in the neighborhood also.

By Mr. Mathewson:

Q. What indicates that gas engine; that drop?

3974 A. No, this jumping here, this zig-zag line. You see the time it started. The peculiarity about this chart is that it is within about six blocks of a gas works and eight blocks from another and yet there is the minimum and it is nearest to the gas works, a very peculiar feature. It indicates that the pressure was maintained by gravity.

Q. Now, these were all the tests or readings which you took with the exception of some few which were done during the——

A. At times of small consumption. I did not consider the charts taken before gas stoves, on top of lighting, as being——

Q. These are the only charts with full runs of twenty-four hours so as to show the indication during the day?

A. Yes.

Mr. Kirby: He had some charts taken for a few hours which he did not really consider a fair test of what was going on and so we did not offer them. I offer these charts in evidence.

Received in evidence and marked respectively State's Exhibits MM, NN, OO, PP-1, PP-2, QQ-1, QQ-2 and RR.

Q. From the result of these experiments of pressure you have made and about which you have just testified, and upon your experience as an engineer, builder and operator of gas plants, in the manufacture and distribution of gas, do you or do you not consider that the Consolidated Gas Company can maintain a pressure in service mains such as you have described them of not less than one inch nor more than two and one-half inches?

A. I think that can be maintained under due precautions.

Q. You consider such a pressure could be maintained without any change in their present distributing system?

A. It would appear so, as far as I have examined the pressures.

Q. Do you consider that by the introduction of certain
3975 changes in the company's system of distribution that a pressure in any service main at any moment of not less than one inch nor more than two and one-half inches could be complied with, with less care and attention, and less risk of a momentary compliance than under the present system?

A. Yes, I do think it can be done.

Q. Do you think it could be done practically without great expense?

A. I think so.

Q. This morning you stated that you had made certain experiments from time to time with regard to candle-power or, rather, illuminating efficiency under different pressures, with regard to the pressure required for the proper operation of gas burning appliances for the purposes of heating, cooking, etc. Did you assist Professor Hallock in the experiments he made and about which he has testified?

A. I did.

Q. Are the results stated by him accurate and correct results of experiments?

A. I think they are substantially the same as my own.

Q. Have you made any other experiments than these?

A. On New York gas?

Q. On New York gas?

A. I experimented on New York gas since 1872.

Q. Experimented upon it for the purpose of finding its illuminating efficiency?

A. Yes.

Q. The proper point of pressure for the consumer along the same lines as the experiments taken by Professor Hallock?

A. Along the same lines.

Q. Have you experimented with illuminating gas elsewhere?

A. I have.

Q. For those same purposes?

A. For the same purposes.

Q. Have you made any experiments upon the Welsbach burner for this purpose?

A. Yes, I interested myself in the Welsbach burner at a
3976 very early date and made continuous experiments on the original burner and all improvements I have been able to hear about or been told of.

Q. Have you used any special apparatus for this work?

A. I have used all known established standards. The Pentane standard, the candle standards, Mobile lamp standard, the Methven standard, and such modifications and improvements in the photometer itself as have occurred from time to time, the revolving disc and various conveniences and appliances that make observations more accurate.

Q. Have you brought forth a standard of your own which you have used in conjunction with these others?

A. I brought out several standards; I first published in 1875 the Mobile lamp standard, now called after me, but I call it the Mobile lamp standard, because I first brought it out at that point. I also brought out and described before the Gaslight Association a standard almost identical, if I may say, with the present Elliott Standard Flat Flame.

Q. Is this standard which you modestly call the Mobile standard, but which is known as the Edgerton standard, in use in any of our scientific schools or by the government?

A. I have heard of its being used in quite a number of places. At one time the United Gas & Improvement Company made use of it, and I noticed in reports from various gas companies that they use it.

Q. Do you know whether it is used by Harvard University or Columbia University in the scientific department?

A. I found a peculiar use of this standard by Harvard University described in a periodical, used in order to standardize the photographic plates of which they make star maps. It is desirable to have photograph plates of uniform density in development and to accomplish that they had to have a standard light and I notice 3977 they adopted this standard. Also the government used this standard in the lighthouse service.

Q. In the course of your work and studies have you experimented with appliances using gas for heating of cooking purposes, relative to the required pressure for the proper use of the same?

A. I have.

Q. And where, when and how long?

A. In the very beginning of my experiments in gas lighting I kept up a set of tests on various heating devices, gas stoves and gas in Fort Wayne, Indiana, I might say in New Orleans, and at Mobile.

Q. In New York City, Borough of Manhattan?

A. New York City and Danbury.

Q. Are you familiar with the different kinds of appliances in general use burning illuminating gas for heating and cooking purposes?

A. I have had to do with almost all of them, most of all the different stoves and heating devices, getting them in and getting them adjusted to the best advantage.

Q. Now from your experience and from your experiments what do you think is the pressure required at the point of issuance of the flame for the proper operation of the appliances using gas for heating and cooking?

A. At the point where the gas issues in contact with the air, and that is where they are using the stop-cock shut off, the pressure rarely exceeds .3 of an inch.

Mr. MATHEWSON: I do not think that was the question quite.

The WITNESS (continuing): Well, it is generally set down to that. Where the wheel or needle valve is used the pressure can be brought to any point that the gas will give, 2 inches or 2½ or ½ an inch or any other pressure, but on most of the stop-cock apparatus it will be found on test that the pressure at the point of issue very seldom exceeds three-tenths, or four-tenths and they will give a good flame.

3978 Q. That gives good and satisfactory results?

A. It is not quite as satisfactory as a slightly higher pressure, but there is no discoverable loss of efficiency, nor is there any trouble about striking back.

Q. What do you mean by striking back?

A. Striking back is a phenomenon where the gas issues so slowly from the point that the light will travel back through a mixture of gas and air and ignite it right at the point where it comes out, destroying the power of the flame to heat up.

Q. So that instead of having a flame which consists of the combination of gas mixed with air, you will simply have gas burning before it has an opportunity to become mixed with the air?

A. Exactly.

Q. So that the first requirement of a gas burner apparatus is to have a pressure sufficient to prevent it from striking back?

A. It is absolutely necessary.

Q. And what pressure did you say was necessary for this purpose?

A. On all ordinary gas stove apertures, a pressure of three-tenths to four-tenths will prevent it striking back.

Q. You consider that a pressure slightly greater than this amount is more satisfactory?

A. Yes, it would be more satisfactory.

Q. What do you mean by "slightly greater?"

A. Oh, inside of an inch it would be satisfactory, perfectly.

Q. Now in regard to the class of apparatus which do not use the burner which you have just been speaking about, but the jet type, is there any danger of striking back?

A. You mean the wheel valve type?

Q. Yes.

A. No, ordinarily with that where it is turned on sharply there is no danger of striking back whatever. If turned on slowly it might do so.

3979 Q. Is it possible to so regulate this class of apparatus so as to be as efficient and as convenient and effective in operation with low as with high pressure, that is, with pressures about an inch and pressures as high as two inches?

A. I think from an inch to two and one-half you could regulate it just as well as though you had any other pressure. I don't see any difference.

Q. So that would be as efficient and convenient for use with one inch as with a higher pressure?

A. Yes. I could explain the reason. Do you want me to explain the reason for the higher pressure?

Mr. Mathewson: I don't think he knows. I shall object to that.

Q. Now, from your experience and experiments with various kinds of open flame burners, what do you find is the most efficient and most convenient pressure to be used in the burner suitable for illuminating purposes?

A. Taking the city test burner to start with——

Q. What do you mean by the city test burner?

A. The one used by the city tester to test the illuminating power of gas.

Q. What burner is that?

A. That is the Bray Slit No. 7. The pressure at the point of ignition there, giving the highest result is from .14 to .18 of an inch. The pressure as required for an argand burner is about .1 inch.

Q. Does this pressure with the Bray give a satisfactory flame?

A. It gives a highly efficient flame but it is a vacillating, bobbing flame, not a stiff flame, such as consumers generally would like.

Q. What would you consider the best pressure not only for efficiency but for convenience and satisfaction of consumers?

A. In this Consolidated gas as made at present, about .6 would be the all-around and most satisfactory point of pressure at ignition.

Q. Go to the other burners, what do you find?

3980 A. With the consumers' burner you stand slightly more but with a loss of efficiency compared with the Bray of about, well, from 22 candles down to 18 or somewhere along there, that would be quite a large loss of efficiency to get a steady flame.

By Mr. Mathewson:

Q. What do you mean by the consumers' burner?

A. The E. H. Lava tipped is a type, excavated head, that is most generally used.

By Mr. Kirby:

Q. Such a one as known as a bat-wing lava tipped burner?

A. Yes. Walking around the streets of New York City I see probably ten of those used to one of any other type.

Q. With regard to the Welsbach burners what did you find?

A. Efficiency in the Welsbach burner adjusted by the photometer so as to obtain the highest point is practically the same between one inch and two and one-half inches. I speak of the efficiency per cubic foot of gas.

Q. Now, it is true, is it not, that the efficiency of a Welsbach increases materially under certain——

A. Under heavy pressures and where you get a blow pipe action making a sort as it were of blast of air you can run the efficiency of the Welsbach up to three times the ordinary efficiency, perhaps higher—four to eight inches, which per cubic foot would be very much higher. I have not verified those higher pressures but I have no doubt they are correct as stated in the tests. I have seen the tests made but I have never used the apparatus myself.

Q. In the ordinary use of gas you never obtained such high pressure, did you?

3981 & 3982 A. No, I have not. I have calculated to try and induce those high pressures by means of individual pressure "boosters," you might call them.

Q. But they are not such pressures as are obtained directly from gas mains in this or any other community with which you are familiar?

A. I failed to obtain any higher results from ordinary pressures. At the highest point of the ordinary pressures and with the most modern pressures in regard to the Welsbach burners, there may be a little less liability to smoke with rich gas.

Mr. Kirby: That is all I have with regard to the subject of pressure and candle-power, and as I stated before I ask to have permission to examine Mr. Edgerton on other subjects.

Mr. Mathewson: I should be glad if we could adjourn now instead of an hour later to-night. I am very anxious to get uptown before closing. I shall not take long to cross-examine this witness; at any rate I can easily conclude in the morning session Wednesday, if that will meet the view of the Master.

Mr. Kirby: That is quite convenient to me.

The Master: Do you want to suspend at half past four?

Mr. Mathewson: I would like to suspend now.

At 3.45 o'clock p. m. adjourned to Wednesday, November 7th, 1906, at 10.30 a. m.

Last Exhibits:

Complainant's, 256.
State's, RR.
City's, 63.

3983 Circuit Court of the United States, Southern District of New York.

Consolidated Gas Company of New York, Complainant,
vs.
Julius M. Mayer, as Attorney General of the State of New York; William Travers Jerome, as District Attorney of New York County; Frederick E. Gunnison, John C. Davies, and Lucian L. Shedden, Constituting the New York State Commission of Gas and Electricity, and The City of New York, Defendants.

Before Arthur H. Masten, Special Master.

New York, *November 7th*, 1906.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Kirby.

3984 Mr. Burr: We had some discussion at the last hearing with regard to the City being permitted to examine the maps of the Company showing the mains of the Consolidated Gas Company in the streets. In making such an application I relied upon the testimony of Mr. Simpson, as it appears in this record on page 355, in which he states that these maps show every main of the Consolidated Company in every street in the Borough of Manhattan; and on page 355 we made a demand for an examination of those maps and Mr. Mathewson objected to it because of their bulk. Because of the conflict of opinion with regard to the propriety of examination of the note-books from which the maps were made up, or claimed to be made up, I visited the office of the company on Monday and had an interview with Mr. Addicks and Mr. Carter there. It seems to me quite evident from a cursory examination of the books that it would take a month or two to make up any schedule from those books regarding the mains; but the maps themselves, it is quite plain, will show with very little trouble the exact location of the mains, but will not show, as Mr. Simpson has testified, their distance from the curb without reference to the books. And my expert, Doctor Marks, informs me that within ten days, with a few assistants, he can procure or take from the maps a statement showing the duplications and all the particulars that he desires to have with regard to these mains. I have here a letter from him advising me with regard to that; and he is perfectly willing to consult with Mr. Simpson in case any discrepancy between the statement presented by Mr. Simpson as to the mains, number of miles and sizes; and any discrepancy that may exist between that statement given here and such as may be found to result from an inspection of the maps. I submit that we are entitled to that, as it forms a very important item in the 3985 property of the company, and also forms a very important point in our defense, because we wish to establish if we can that the present arrangement of these mains is not an economical one, but because of duplication and triplication it adds an expense to the cost of gas which the consumers should not be justly required to pay.

The Master: There may be some question as to the materiality of that line of proof.

Mr. Mathewson: I certainly shall make the point that it is wholly immaterial. I wish to say in respect to this application that after the conference between counsel and the Master, we have decided to permit the examination of the maps, but upon this statement: I have carefully examined the character of the maps prepared by Mr. Simpson and others, and find them to be secondary evidence, wholly secondary evidence. They are graphic representations of the records in the books. They are made up from the records in the books by clerks who may or may not in every case be accurate. They are not drawn to a scale on the maps, and if any discrepancy appears between the maps and the books, it would be so much the worse for the maps, because the books would be the exact and original entry and accurate entry. For instance, they do not show the distance from the curb, and the distance from the curb, considering the joints, and the going around corners, might make a difference of 100,000 feet, there being 60,000 corners, I think in New York, perhaps more; something like 20 miles difference in that alone. And the examination of these records will not bind us as an original record. Our opponents have asked to go to the original sources, and we have offered them the original sources, and I want it to be understood in advance that nothing as to dimensions or otherwise appearing upon those maps which may differ from the records 3986 of the books, if there be any difference, would be reliable, but the books alone would be. In other words, they are made from the books, and I do not want counsel to come in here after making a crude measurement of those maps by steel tapes and claim that anything they find is in conflict with the actual records of the Company as to its system.

The MASTER: That seems to avoid any misunderstanding about it.

Mr. BURR: Then what is the disposition of the matter?

The MASTER: Mr. Mathewson says that your men may be allowed to examine the maps.

HENRY H. EDGERTON resumed.

Mr. KIRBY: Shall I proceed?

The MASTER: I thought you had finished.

Mr. KIRBY: I have one more chart to put in which is taken up to 8 o'clock this morning.

By Mr. KIRBY:

Q. I will ask you to describe where that is taken, and during what hours, and what the general result is?

A. This chart is taken at a jewelry store fronting on Battery Park.

Mr. MATHEWSON: What jewelry store, what number?

The WITNESS: I have not got the number. I left my apparatus there and did not get the number, intending to go back and put it on again. It is on Broadway and——

Mr. KIRBY: I will supply the number of the store.

3987 The WITNESS: The record commences on November 5th, 5 P. M., and continues to November 7th at 8 o'clock A. M. The record shows a uniformity of pressure about midway between the 1-inch line and the 2½-inch line, and during the whole course of the registration does not depart from a uniform pressure to the extent of half an inch, except when the party had on a gas heater it went down slightly; so you can fairly say the regulation of pressure was within half an inch, of water.

Q. What was the maximum point on that reading?

A. Two inches on November 5th, and the minimum was 1 and 7-10th inches.

Q. On November 6th?

A. November 6th the maximum was 2 inches and the minimum 1 inch and a half.

Q. The pressure is registered on both sides of this chart?

A. Yes, sir.

Q. You, for the purpose of convenience, did not put upon the apparatus a new card, but merely reversed the one that was on for November 5th?

A. Yes.

Q. In what part of the store was the apparatus placed?

A. In the back end of the store, about 20 feet from the meter.

Q. Is the store on the ground floor?

A. Yes.

Q. That is the street level?
A. Yes.

Mr. Kirby: I offer it in evidence.

Chart received and marked State's Exhibit 88.

Mr. Kirby: Mr. Edgerton has not as yet had time to read over all his testimony, but desires that I should call attention to one important error therein. On the top of page 3980 it states, "with the consumers' burner you stand slightly more, but with a loss of efficiency compared with the Bray of about, well, from 22 3988 candles down to 16 or somewhere along there." That ought not to be 16, but 18. With that correction, while there may be, and probably are, some typographical corrections which we have not noted yet, I am through with Mr. Edgerton, except that I do not want it understood, because I have finished in the matter of pressure, that the matter of pressure will not be referred to when it comes to the question of cost or anything of that kind, because naturally it may be referred to.

Cross-examination by Mr. Mathewson:

Q. Did you ever manufacture any gas-making apparatus, such as benches and retorts and things of that sort?

A. In what is known as the Kerr-Murray Manufacturing Company, Fort Wayne, Indiana, originally started as Murray, Baker and Walker, I gave them the benefit of my experience in regard to planning their apparatus and starting out in business.

Q. Are you a member of that firm?

A. No, sir.

Q. Have you ever been in the business yourself of manufacturing gas-making apparatus?

A. No, sir.

Q. Have you ever yourself as a contractor installed gas-making apparatus?

A. No, sir.

Q. As distinguished from an engineer?

A. I have been both engineer and contractor in numbers of cases.

Q. Do you hold the degree of civil and mechanical engineer?

A. No, sir.

Q. Do you hold a degree as engineer of any faculty?

A. No. I never graduated from any school of engineering, except experience.

Q. When you referred to Fort Wayne, Chicago, Sunbury and so forth, in the early seventies, do I understand that you your- 3989 self were the contractor who built those works, or were you supervising the building?

A. Sunbury, and those towns I mentioned within Northumberland and the adjoining county, myself and Mr. Patton were contractors and engineers both, took contracts for the work and drew up the plans for it and executed the work.

Q. Did you construct the New Orleans works?

A. Yes, sir.

Q. All of them?

A. No, sir. I reconstructed the coal gas addition in 1872-3-4, and drew up the plans and superintended putting it under contract.

Q. Did you stay there until the work was completed in New Orleans?

A. Yes, I was there until it was fired up.

Q. Were you there when the works were started and in operation, or were you absent at that time?

A. I think at the first firing up of the benches in 1874 I was not there. Mr. Forstall wrote me it didn't run well and I went down and straightened it up, and the trouble was the ground was full of water and the benches were saturated with water and he did not seem to realize the amount of time required to dry them out.

Q. You were not there when it was started up?

A. Not when he put the first fires in.

Q. Where is Mr. Patton at present? Is he living?

A. The last heard of him he was living, in Tennessee.

Q. When you say you were consulted as to the Mutual Gas Light Company of New York, do I understand that was a change from coal gas to oil gas or to water gas in 1872?

A. To what was known then as naphtha gas, the same as the present oil gas only they employed naphtha instead of oil.

Q. Do you mean the Wilkinson process?

A. The works did not start on the Wilkinson process. That was added subsequently. The works started under the Gale & Rand process, for which I was subsequently the engineer for the
3990 Gas Light Company of America.

Q. You say this was in 1872, and in 1882 you became connected with the United Gas Improvement Company?

A. Yes, sir.

Q. What duties did you perform in connection with that company?

A. I had certain views with regard to the proper introduction of oil gas and I only cared to go according to my own views as to the way the thing ought to be done. And therefore I only took charge in connection with such works as they built, according to my views, although I was consulted with regard to others.

Q. You say those are only New Orleans and Pensacola, don't you?

A. New Orleans, Pensacola and Wallingford.

Q. How long were you with this United Gas Improvement Company?

A. Nine years.

Q. You were not especially active, were you, while with them?

A. I think I was about as active as anybody connected with it. I say I demurred about making a highly poisonous water gas.

Q. Was that the reason why you left the United Gas Improvement Company?

A. Well, substantially. I think the difference of opinion in regard to the policy of the company was the reason we parted.

Q. You say with them you acted as engineer and chemist?

A. Yes, sir.

Q. What were your duties as chemist?

A. Testing of gas; and one important duty was finding out how to use gas oil, I think that was the most important. Before that it was an entirely waste product and the president of the company had urged on me the use of waste oil and intermediate oil and at last I found means of using it.

3991 Q. You were not an officer of the United Gas Improvement Company, were you?

A. Certainly I was.

Q. What office?

A. Engineer and chemist—always addressed as such.

Q. I don't know whether that is an officer or not, but did you hold any other office except engineer and chemist?

A. Do you mean as director, secretary or anything?

Q. Yes, or vice-president, general manager or anything of that sort?

A. No, sir. I managed all my own business in construction.

Q. I am speaking about the United Gas Improvement Company. You held no position, did you, except engineer and chemist?

A. That is all.

Q. In what cities did you design the mains system?

A. In all those in which I was contractor and in all those in which I was consulting engineer. I was constantly applied to for information with regard to laying of mains and testing of their capacities and advising in regard to new mains.

Q. Did you ever construct a mains system in the City of New York?

A. No, sir. I——

Q. Or in Boston?

A. (Continuing:) I was consulted about it as to what difference they would have to make in the distributing system owing to the gas being heavier than coal gas and what measures they would have to take in regard to it.

Q. Who are "they," you were consulted by whom?

A. The president of the company.

Q. What company?

A. The Mutual Gaslight Company; and Mr. Kennedy and Mr. Leary.

Q. But never consulted about the Consolidated Gas Company, were you, as to the system of mains in New York?

A. Not after the consolidation, and I don't think before, of any account. I talked over it with Mr. Bradley pretty frequently.

3992 Q. A main system was in existence in the City of New York, wasn't it, at the time you were consulted by the Mutual?

A. Yes.

Q. And any changes in their main system had to do with the difference in the gravity of the gas that would be produced as between the old coal gas and the proposed new process, hadn't it?

A. Yes, sir, exactly.

Q. Have you ever installed a system of mains in Boston or any of the other large Eastern cities?

A. I never installed them, never as contractor or engineer, except giving my advice in regard to the introduction of mains.

Q. Except in the case of the Mutual?

A. On application of the Gaslight Company of America for a charter in Lowell. I designed a system of main distribution, which was not carried out however. And also in Providence, R. I.

Q. It is a very small main distributing system in Lowell, anyway, isn't it, as compared with large cities?

A. Yes, sir, small, but the smaller the system the more ability and more particular you have got to be in devising, for the simple reason that the large mains in a large city give a man freer scope than in a small town.

Q. How about a city like New York or Boston where many of the streets are narrow and crooked and where they are already so filled with subway pipes as to make it difficult or impossible to put in bigger pipes; doesn't that introduce an element of great difficulty in laying a main system?

A. I have no doubt it does. I have examined points where I considered there were difficulties to meet when I noticed openings in the street where I saw a man had to mind what he was about to get mains in.

Q. You say that since 1870 or about that time you have made a study of petroleum products. What has been the cost of naphtha from then down as to price? Hasn't it increased very greatly in price?

3993 A. There have been numbers of fluctuations. It has generally increased. Now it is almost out of the question for gas-making although I see numbers of companies still use it.

Q. To a small extent?

A. Well, the last Massachusetts report shows considerable use of naphtha.

Q. If it is under the head of naphtha and is shown to cost five or six cents it cannot be the good grade of naphtha which we ordinarily include in the term "naphtha," can it?

A. No, sir. It is the crudest form of naphtha.

Q. And so, too, the other grades of oil have a tendency to rise in price, haven't they—the better grades?

A. No. I think in those companies where I have had opportunities of knowing exactly the cost the present prices are very reasonable.

Q. About what they were ten years ago, do you think, for 28 and 34 degree oil? Do you think the prices are now about what they were ten years ago in this section?

A. I never got that any cheaper than 3¾ cents, that I remember.

Q. For what, 34 degree?

A. I did not regard the degree of as much importance as some seemed to think.

Q. In other words I suppose you mean that taking two 34 degree oils, one 34 degree oil may be a very much better oil for gas-making than another 34 degree oil, depending on its composition?

A. In my opinion there is no such thing as a 34 degree oil in existence.

Q. Well, taking what is commonly called a 34 degree Beaume test, might not one oil of that specific gravity be much more valuable than another oil for gas-making purposes, of the same gravity?

A. It might be on the earlier forms of gas apparatus, but I do not from my experience see any particular advantage in the exact
3994 degree of the oil provided it is not so heavy as to be difficult to evaporate or turn into a vapor.

Q. My point is this, that take two oils which test 34 degree Beaume, one oil may for gas-making purposes by reason of its composition be better than another oil which tests the same so far as Beaume test is concerned, may it not?

A. I do not think there is any essential difference, if you want my opinion as regards what the difference in these oils is really. I find it is the admixture of parafine in the oil which makes practical difficulties in gas-making and not so much the slight difference in degrees of the intermediate oil.

Q. Do you consider that the heavy oils that are now used are as good for gas-making as the old intermediate oil?

A. I consider them just as good if they do not contain any essential percentage of parafine; that is, parafine that solidifies.

Q. Does the present oil give as fixed a gas as the old intermediate oil.

A. In testing for the fixity of gas it is the capacity to stand cold weather, and I contend that there is no substantial difference between them. Naphtha seemed to give a gas that would stand cold better than heavy oils.

Q. When you say "stand cold" what do you mean, that in the cold weather the candle-power is likely to be dropped as the gas proceeds through the mains?

A. Not through the mains essentially. I think the loss is in the holder.

Q. Well, it is dropped between the manufacturing station and the delivering points somewhere?

A. Yes, quite seriously.

Q. Do you consider Texas oil, commonly so-called, as good as the oil used before the Texas oil came into the market?

A. I have only had two years' experience with Texas oil and I did not like it I must confess, but I did not make any change in the apparatus to meet the difficulties and perhaps it could be done.
3995 It gave about ten per cent. less quality of gas for the same amount of oil.

Q. Now, let us take the subject of pressure. You say that you took your pressures on services not in use at the time. Did you read Professor Hallock's testimony that there were three or four other fixtures connected with the pipe on which he made the pressure tests?

A. Yes, there were.

Q. You don't know whether any of those may have been lighted or not, do you?

A. Yes, I think I do.

Q. How do you know? Did you stand there?

A. I went around and looked.

Q. How often?

A. Well, from the fact I gave orders to have burners lighted to clear that large 100-light meter of the gas that was in it in order to get fresh gas, and so I went around to see they were burning and also saw that they were put out.

Q. Are you able to say from your personal knowledge that some one of those jets may not have been lighted up while these tests were in progress?

A. I think the indications of the chart would show if there was anything lighted during the time they were taken, aside from what I drew from the gas. Even lighting one of the photometer burners would show on the chart.

Q. Would make an appreciable representation on the chart, wouldn't it?

A. Such as I could notice. I don't know as a person would notice it that was unaccustomed, but I think all those charts would show where we drew any gas out.

Q. Did you take these pressures inside the main?

A. Yes, sir. That is, on the house pipe side, as we call it, if that is what you mean by inside.

Q. Yes, and did you take them at the burners in each case?

A. For photometrical observations, did I understand you?

3996 Q. I am referring to the ones on the charts which you have introduced?

A. No, the chart was taken from a pipe by itself but it was attached to pipes that supplied the photometers with gas also.

Q. But in some of these tests shown on your charts they were taken about 125 feet distant. Were your tests then made at the burner?

A. Yes, inside the meter on the consumers pipes.

Q. Were they made from the house pipe?

A. Yes, sir. I lighted burners to see how much effect it had on the pressure, to see how much difference it made on the sheet from the lighting of one or more burners.

Q. When you say that you examined your testing apparatus in advance and that it tests within 0.100 of an inch, you cannot make a test of 0.100 of an inch with a water column, can you?

A. No, sir.

Q. How did you test, then, to determine whether the small fractions were correct or not?

A. Well, for instance, on that chart the pen is fine, probably not more than 0.100 of an inch in width, and whenever I noticed a vibration amounting to the width of that line I should judge it was sensible to that degree. I know it is more sensitive than the water column because I saw the hand move when the water column was perfectly steady.

Q. What allowance do you make for difference between pressure in the house pipes and pressure in the mains?

A. That depends on whether they are burning gas or not. If they are not burning any gas at all it would not make any difference.

Q. Does it make any difference how the cock of the meter may be turned as to the relative pressure in the house pipes and in the mains?

A. Not a bit, if there is no gas burning, unless turned clear off.

Q. Does it make any difference what size of house pipes you have, whether they are very small or very large?

A. Not a particle unless the gas is in motion.

3997 Q. After it is in motion, how then?

A. The pressure will drop as soon as the gas begin to move.

Q. Was the gas in motion or burning at any time during these tests on the charts which you have presented?

A. At the point on the chart it shows where the gas was moving, and where it does not show it I consider the gas was still.

Q. If taken at the building with a full service, with a great many gas jets, the difference between pressure at the burner and pressure in the mains might be half an inch, might it not?

A. Yes, even more; and on small ones lower.

Q. What would be the maximum limit of variation would you say?

—. According to the way the house is piped, there might be an absorption of pressure on large consumption and also as indicated on those charts, of two inches.

Q. Now, you stated in reference to these charts from time to time that at the points you have mentioned weights were piled on. I suppose you conclude that the weights are piled on by the character of the curve that the pen describes in these charts, do you not?

A. Whenever I come to a point on the chart where there is an abrupt rise in the pressure or an abrupt fall I know the pressure has been altered further by a governor or valve.

Q. In other words, your conclusions are based upon the character of the curve described, and you have no information other than that?

A. No information other than the chart itself. I didn't need it.

Q. Referring to Mr. Forstall, didn't you construct the plant in New Orleans outside of this coal gas plant to which you referred?

A. A water gas plant. I constructed a coal gas plant in 1872-3-4, and a water gas plant in 1882-3-4.

Q. Were you there until the water gas plant was started up?

A. Yes, sir.

3998 Q. Were you there when it was started up?

A. I was. I started it myself

Q. You say in referring to these charts that the pressure indication falls with increased pressure?

A. Increased consumption.

Q. You said with increased pressure I think, or else my note is wrong. You mean with increased consumption?

A. Pressure falls as the consumption increases.

Q. Well take the Exhibit KK, sub 2, at Columbia University, October 11, 1906, about 6 P. M. or a little before that, the pressure would be increased, wouldn't it, ordinarily?

A. Well, you see——

Q. No, just answer the question. Ordinarily the pressure is increased about 6 P. M. or a little bit before, isn't —, for convenience of use, for business use, cooking and one thing or another?

A. It is increased at the works.

Q. That is what I am talking about. But the pressures seems to decrease as shown on this chart, do they not?

A. Yes, that is the chart.

Q. In other words the draught of consumers, in spite of increased pressure at the works, shows decreased pressure at Columbia University on this date, October 11th?

A. Yes.

Q. Isn't that what you would commonly expect?

A. Always expect that.

Q. Now the pressure——

A. Excuse me. It does not follow that it will be increased above the two inches and a half by any means.

Q. No, but it is increased?

A. Yes, the holder pressure will be lower and probably is a good deal lower at that point, and there the pressure at the holder might be an inch less and still afford a pressure at that point.

Q. On account of the greater elevation of Columbia University?

A. Yes, sir.

3999 Q. Now we have the Columbia Printing House, Exhibit KK, sub-1, on the same date, October 11th; did I understand you to say that the drop just before 6 P. M. in pressure on this chart was due to consumers lighting a jet?

A. One burner.

Q. One burner then lighted has pulled the pressure down something like two-thirds of an inch on this chart, has it?

A. Yes, sir.

Q. And when a second burner was lighted it brings the pressure down say one-third of an inch more, a little after 6 P. M.?

A. Yes, sir. That is the obstruction of meter. The meter is working hard.

Q. In other words, those two burners, as I make it out here, reduced the pressure about an inch and a quarter, didn't they?

A. In that particular case. Ordinarily it would not affect it but slightly, but the meter being out of order or stiff it moved down.

Q. Did you examine the meter to find if it was out of order or stiff?

A. I didn't have to. That is a perfect indication.

Q. Did you examine the meter to find if it was out of order or stiff?

A. No. I will say it is not absolutely certain; that there might be another cause; it is altogether probable the meter was the cause.

Q. That is your conjecture from what this shows?

A. Yes. I should always take it to mean that the meter was out of order.

Q. But it might be due to the other cause, you have said?

A. Very remotely.

Q. Do I understand you to express the opinion that those two curves on State's Exhibits Sub-1 and Sub-2 are identical except as to the average?

A. Yes, absolutely.

Q. Do you think they are absolutely identical?

A. Same holder.

Q. Now do you know how far from this 125th Street place, which was on a Standard Gas Company's service, there is
4000 any connection between the Consolidated Gas mains and the Standard mains?

A. I have not any other evidence than that, but that is absolute to my mind, that there is some connection.

Q. Supposing you found that there was no connection within ten blocks between the main that goes to Columbia College and the main that goes to 125th Street, no connection within ten blocks of the 125th Street place, does that make any difference in your conclusions?

A. No, not if it was fifteen or twenty blocks away.

Q. You think then such a remarkable concurrence between the locations in these two sheets KK, proves that the same pressure produced it?

A. It relates away back to the holder itself. When you come to superimpose them in the right manner, you will find the curves are absolutely identical. Take this point where there is change of pressure in the holder and then run your eye along that line by superimposing them.

Q. I do not find it any more identical with my eye than in the other curves you have produced here.

A. Have you looked at it in that manner (superimposed)?

Q. Yes, I did. I think it shows for itself, however. You do not need to proceed further with that.

A. Yes. It shows for itself.

Q. Do you know whether there was any jet lighted at this printing house at 125th Street?

A. No, sir, none there. I made an arrangement with a man to keep them turned off and the indication on the chart on subsequent dates shows he did it.

Q. Well, taking Exhibit KK, sub-1, it would appear as though if another jet had been lighted about six o'clock P. M. the pressure would have been reduced to zero, wouldn't it, at that same ratio?

A. That is so.

4001 Q. Taking the whole thing. What would have happened then? Would the lights have gone out?

A. You would probably have heard from them at the office.

Q. What would have been the effect if you lighted one or two more jets which would reduce the pressure to zero; would that make one or more of the jets in danger of extinguishment?

A. No, they would not be both extinguished; just simply die down. There would be some gas coming through, enough to keep the light on.

Q. But they would be reduced to such proportions that they would likely to be extinguished by any draught, wouldn't they?

A. The lower you turn a burner down the more apt it is to blow out.

Q. Yes, I know; but assuming the proportionate rate of reduction in pressure was continued at 125th Street, at the printing house, by the lighting of perhaps two more jets, which would reduce the pressure pretty nearly to the zero point, if not quite, according to your chart, then would it not be true that the flame would probably be reduced to such small proportions that it might easily be extinguished by a draught?

A. Yes, I think possibly it might.

Q. Now, in State's Exhibit LL, taken at the Columbia Printing House, 125th Street, and Columbia University, October 12th, do I understand an identical character in those curves which must indicate that they come from the same holder pressure?

Mr. KIRBY: He stated he did not, on his direct.

Mr. MATHEWSON: He stated that he did on his direct, according to my notes.

A. No, there is no coincidence there at any part.

4002 Mr. KIRBY: That is in accordance with his direct testimony.

Mr. MATHEWSON: I think he did start to make a coincidence and then withdrew from that position. I think that is the fact; I remember it now.

Q. Now, let us take the Grand Union, on August 17th and 18th, Exhibit MM; that appears to go substantially above 2½ inches, doesn't it?

A. Yes, it goes above two and one-half inches, but the weight of it has been put there by the gas company.

Q. How do you know that?

A. Right there you can see it as plain as day.

Q. You can see it rises on this chart, can't you?

A. It don't rise itself, it is by letting on more gas.

Q. This is about nine A. M. the rise begins, eight or nine A. M.?

A. No, it is seven o'clock P. M., quarter past seven the rise began.

Q. Yes, that is right. What is the effect on pressure in the mains of the shutting off of gas ranges which largely operate between six and seven o'clock in the evening, we will say, if you maintain pressure at the works?

A. The effect of shutting off any consumption of gas is to increase the pressure.

Q. So that if it be true that gas ranges are largely in operation from half past five to seven in the evening and they were shut off, or many of them, or part of them, by seven o'clock, it would tend to increase the indication of pressure for the balance of consumers, wouldn't it?

A. That has nothing to do with that.

Q. Wouldn't it?

A. Yes, but it is entirely apart——

Q. It may be but that is another thing. Do not argue with me. This rise in pressure may be due both to the shutting off of the gas ranges and to an increase of pressure at the works, might it?

4003 A. Yes, it might.

Q. And this, you understand, is the Standard Gas Company at the Grand Union Hotel?

A. I inferred it was from the character of the chart and the way the pressures are handled. I did not ask the man for his bill or did not take any measures to find out whose gas it was, but as soon as I saw the chart I made up my mind it was the Standard or some other company, not the Consolidated.

Q. Now, in short, isn't it true that the pressure at different points of a main and at different services changes frequently while the pressure at the works may remain exactly the same?

A. Certainly they will change. They endeavor to meet them at the works.

Q. In other words, changes of consumption over which the company has no control would make changes in pressure at different points of the mains if the company maintained a uniform pressure at the works, would it not?

A. Yes.

Q. How could the company correct any changes due to changes of pressure on account of draughts of consumers except by greater pressure at the works?

A. That is the way to do it, by so arranging the pressure at the works as to meet the conditions in the mains. That is the important point.

Q. Now, let us take State's Exhibit NN showing pressure at 3607 Broadway, October 13th and 14th. Was that a Saturday, October 13th?

A. Saturday and Sunday, I believe. There are two cards there, two sheets.

Q. I see only one here.

A. They have become detached.

Q. Yes, there is another, State's Exhibit OO, October 14th; the difference in pressure at 6 P. M. seems to be very marked between Sunday and Saturday, does it not?

A. Yes, sir.

4004 Q. What would that be due to, difference in pressure at works or difference in consumption?

A. Due to the difference in consumption there.

Q. What would these great irregularities in the chart of October 13th indicate?

A. That is the consumption inside the building, a shortage of pipe, deficiency of pipes within the building undoubtedly.

Q. You don't know whether that is a new or an old building, do you? I see your tests are made on the fifth story?

A. I don't know. It has insufficient piping, that is evident, within the building.

Q. Would not a very heavy draught within the building due to a large number of burners have the same tendency to reduce the apparent pressure as the small piping with fewer burners?

A. Yes.

Q. Now, take No. 1 Platt Street, October 15th, 1906, State's Exhibit PP—you say that a gas engine was started. How do you know that there was a gas engine started there?

A. In the nature of those fluctuations, I do not attribute that to a gas engine; it might be due to some form of a suction of gas off the pipes as I found frequently inside of a building; they will put some form of blower on to draw the gas off and make such an effect as that, but it is violent oscillations of pressure.

Q. Would not the same answer apply to the blurred line shown on State's Exhibit PP, sub-2, October 16, 1906?

A. That is one of those I noticed of the gas in the neighborhood bobbing from water in the mains and I think that was the case there.

Q. You think that was so, but don't you think that the company would have been likely to have received a complaint provided there had been water in the mains to that extent?

A. I asked some of the customers along there and they said they were used to it. I asked in a cigar store why he did not complain and he said it didn't bother him much. It was bobbing and would bother him considerably, I should think, and I asked him 4005 how long it had been going on and he said ever since he commenced to light up in the fall, but he didn't care.

Q. It didn't bother him enough so that he cared?

A. It didn't bother him enough to make him care about it.

Q. Now, you made certain fragmentary tests which you did not complete. Why were they not completed?

A. Well, those tests were marred by drawing off gas in the university and pumping and performing experiments on gas pressure, and required so many explanations to state what was going on there that I thought there would be no use of putting them in.

Q. Have you those fragmentary tests here?

Mr. Kirby: They are in my office.

A. They are simply where the record is marred by having pumps going there to compress gas, and various other experiments we were making, and it obscured the real design of finding what the pressure in the mains was so I left them out.

Q. Were all these fragmentary tests made at Columbia University?

A. All made at Columbia College. All the rest were put in. I didn't exclude any except those where we were experimenting on pressures.

Q. Will you bring those down at the next session or let Mr. Kirby have them?

A. Yes, certainly. It will show just what we were doing.

Q. Now, as to there being a gas engine started up or there being water in the mains, the remarks you have made in reference to State's Exhibit PP would apply to State's Exhibit QQ, would they not?

A. Yes, that was water, it is drawn down here, or using a furnace.

Q. Drawn down where?

A. There at that point (indicating).

4006 Q. Well, that is to say, No. 2 Platt Street, October 18, 1906, on State's Exhibit QQ sub-2; the draw down being about what time of day?

A. Well, this is previous, October 17th at 3 P. M.

Q. It began at 3 P. M.?

A. No, but I say I took that off at 3 P. M. and undoubtedly I put this other sheet on at the same time. This was the 3 P. M. line here.

Q. In other words, the 18th started about 3 P. M., did it?

A. Yes, sir.

Q. Shall I put 3 P. M. there?

A. Hold on, I want to be positive about that because sometimes I could not get in that place. You have separated these sheets; that is not the same.

By Mr. Kirby:

Q. Do you mean you have marked that one incorrectly?

Mr. Mathewson: They are both Exhibit QQ, aren't they, one being sub-1 and the second being sub-2? Let us have this corrected if there is any mistake about it.

The Witness: This should be No. 1 Platt Street. I know absolutely this is No. 2B Platt Street for the reason—QQ 1 and 2, they are both No. 2 B for I asked the man what he had been doing to draw that down there and he said he used a furnace to warm up in the morning and then I got him started and he drew this down for me to show how it occurred and he set his motor going and made a blast and it made a suction of the gas on the pipe and I looked at the meter to see the capacity of it because he was burning a large amount of gas and it drew that down, so I know that this and that are the same because this performance takes place in the evening.

4007 Q. What is the beginning of the second page of QQ, what hour?

A. You can deduce it exactly from here. That movement there takes place at the same time.

Q. If you left off at 3 P. M. doesn't it begin on the next sheet at 3 P. M.?

A. No, I think not, because he told me he had put this on here to warm up his building in the morning, to take the chill off.

Q. How is it possible, if you have them consecutive, that it does not fit on? You didn't have a half a day there in that test which appeared on another sheet and which you omitted surely?

A. I remember at that time I had considerable difficulty to find a place that had Consolidated gas and this man locked up and went away about 5 o'clock and it interfered with putting the sheets on regularly, but those two motions of the pen there are identical, I think.

Q. That is merely a matter of reasoning from these two sheets and they do not seem to me to be identical so I do not think I shall ask you to speculate.

Mr. Kirby: Have you anything to show what time you put the second chart on?

The Witness: Nothing more than the chart.

Q. Now, let me ask you did not the putting on of this stove——

A. Furnace.

Q. Well, whatever you call it—you do not mean a furnace to heat the entire building, do you?

A. It was a furnace that he used to take the chill off.

Q. Putting on the furnace to take the chill off, reduced the pressure there more than an inch, didn't it?

A. Yes, sir. It was urged by a power blower, however, or suction.

Q. Will you look at State's Exhibit SS, Broadway Jewelry Store fronting Battery Park, November 5th, 1906, and state what
4008 this smooch is at the bottom about 9 P. M.?

A. That is where the boy brought the instrument down and the pen was left on the paper and in moving it jarred it.

Q. What boy?

A. Some boy that brought the instrument to me, I don't know his name.

Q. You mean after the test had been completed?

A. It had not any reference to the pen. The pen happened to be at that point.

Q. This does not cover an entire day, does it?

A. They shut that off themselves; it covers from 5 P. M. to 9 A. M. in the morning. The occupants of the building shut that off.

Q. In whose charge did you leave that, the boy at the jewelry store?

A. No, I left it in the charge of the proprietor. He said he would not touch it, but it seems he wanted to put his gas heater on and he thought it would be a good idea to shut it off. However, the test was continued on that day.

Q. On the back of this State's Exhibit SS?

A. Yes.

Q. Now I find that substantially every one of these tests at Columbia University, being State's Exhibits JJ Sub 1 to Sub 16 show the pressure above 2½ inches at one time and another; that is correct, is it not?

A. Yes. They put it up at the works; that is easily enough remedied.

Q. And you have stated it as your opinion upon the strength of these tests among other things that it is possible to maintain a pressure between 2½ inches maximum and one inch minimum in the mains of the City of New York. Have you ever operated a gas plant in the City of New York?

A. No, sir.

Q. Have you ever operated a gas plant in the City of Boston?

A. No, not in the City of Boston.

Q. Have you ever operated a gas plant in any of the great eastern cities like Baltimore, New York, Boston, Buffalo, where you
4009 meet the conditions of temperature and elevation which prevail in New York City?

A. No, sir, I have had just the same conditions, the same kind of weather and same elevation, one place the same as another, 100 feet——

Q. You have taken these tests, some in August, some in October——

Mr. **Kirby**: One in August.
Mr. **Mathewson**: I think there are two marked August.
The **Witness**: Only one.
Mr. **Kirby**: Only one marked Grand Union Hotel.

Q. Well, one in August, and mostly in October and one was within the last day or two. Do you not know that in New York City the differences of consumption and conditions in winter as compared with those in summer and fall make it very much more difficult to maintain a uniform pressure in winter than to maintain it in the summer months or early fall months?

A. There is more difficulty with the summer months, but not with the fall months.

Q. You think it is just as easy to maintain a uniform pressure or a pressure within uniform limits in the winter as it is in August?

A. No, not in August?

Q. Well, as it is in October?

A. Yes.

Q. Don't you know that the variation in pressure appears to be very much greater in the winter months than it is in the fall month of October?

A. No.

Q. And have you proceeded on that theory in stating that the Company could maintain a pressure within the limits specified in
the law, that there would be no more difficulty in the winter
4010 than there would be in October in maintaining a uniform
pressure?

A. Just——

Q. (Question repeated.)

A. I will say in the latter part of October, as soon as the lighting hours become coincident with the time of gas cooking and small heating devices, that the pressure draft would be the same.

Q. You proceeded on that assumption in forming your own views, have you?

A. Yes. I find the same elsewhere.

Q. You proceeded on the same assumption in New York .

A. I think that the draft on the mains would not be any more in a December night than it would be in a November night provided that the various devices were in operation. In fact, there would be more heating devices in operation in November than there would be in December in my opinion.

Q. Then the consumption of gas ought to be as great in October as in December, had it not?

A. It ought to be per hour, per maximum hour.

Q. And you think that the concurrence in winter of one very cold and very dark day with the following day bright and much warmer would be a condition which you might find in equal degree in October, do you?

A. I do not see any difference.

Q. And you have stated that changes of pressure may occur in the mains with no change at the works and you have also said that the Company can care for variations of change in the mains by changing the pressure at the works. What indication will there be at the works of the Company to show the need of change of initial pressure at the works?

A. Well, there will be a slight fall of pressure at the works every time there is a larger draft outside of the works, that ought to indicate to them that the main indication is to be derived from just such things as these charts. They want to take charts and find out.

4011 Q. They cannot stop and go out and take charts at 125th Street, can they, when they are keeping up the pressure at 111th Street, they have got to respond to the pressure as the requirement shows itself at the works, haven't they?

A. Well, the differences from day to day would not be so great but what the charts would indicate how they ought to govern the gas at the works.

Q. Do you mean to say that one day's pressure taken on charts of this kind at 125th Street would indicate exactly how they ought to regulate pressure every other day or for a considerable number of days thereafter?

A. If taken at a time when the gas consumption was likely to be at its maximum, yes.

Q. And then they ought to keep the pressure up to the maximum requirement?

A. They ought to keep it up to the requirement. There is no need of any such pressure as shown on the Columbia chart.

Q. But you say that might be with a pressure at the works of only an inch or an inch and a half?

A. I should say not an inch but an inch and a half, I should think the works would afford that pressure.

Q. Do you mean to say by taking a chart of that kind and taking its indication for one day at 125th Street it would be possible to regulate pressure at the works thereafter on the basis of that chart without regard to the question as to whether subsequent days were darker at an earlier hour, and required a consumption beginning earlier and things of that sort?

A. That should be taken into consideration.

Q. How can you take it into consideration except by manipulating your pressure at the works as the indication occurs at the works of draughts on the mains?

A. The indication at the works is while—every time there was a large draught on the main the indication at the works also showed some slight indication, but not as definite and not giving the 4012 exact information that a series of diagrams would give. I would not necessarily confine myself to one diagram. I should take several. I see those diagrams have great uniformity, and all they had to do was to pull down the pressure in the main to comply with the law.

Q. You don't know what the pressure was at any time between the points where you took this pressure and the works?

A. On the chart there—there is a diagram near the works showing they did pull down.

Q. And you found when they pulled down that a man put on two gas jets and his pressure went down seven-tenths of an inch

A. No, I am not referring to that chart, but to a chart taken near the gas works. I took a chart near the gas works to find out whether they had to keep their pressure above or below the line in order to give it at the distant point.

Q. Well, what about the pressure at the distant points, what about the pressure at a greater distance from the holder than you took your readings, that would naturally fall, wouldn't it?

A. Yes. I have taken them at points most likely to be affected, however.

Q. Were the Grand Union tests taken any nearer the works than 125th Street, so far as the Standard Company is concerned?

A. I don't know the distance from the Grand Union to the Standard holders or point of supply, but I do know they could have pulled that excessive pressure down readily enough.

Q. Didn't you say the Grand Union was nearer the source of supply in your direct testimony?

A. I don't remember that I stated it was relative to the source of supply. I don't remember stating that.

Q. Well, to the works?

A. It is nearer to some of the works but I don't know what.

4013 Q. Do you know whether it is any nearer the Standard works than the place at 125th Street?

A. The Grand Union is on 42d Street and there are works on North River and 42d Street.

Q. You understand those are the Consolidated Gas Company works, don't you?

A. I have not absolute certainty that that was the Standard, but I took it from the diagram that it was the Standard works for the reason that it was governed by a governor exclusively during the night.

Q. The Standard meter, did you observe that?

A. No, I did not look at the meter in that case.

Q. Well, if it be true that the Grand Union is not any nearer the Standard works than 125th Street, your reasoning based on this theory would not apply, would it?

A. I did not take much account of the summer sheets and I did not continue them for the reason that I considered that they would not be of much account in this case on account of the small consumption, so I dropped it.

Q. Will changes throughout the district furnished by gas from one distributing station vary uniformly?

A. I observed considerable uniformity in regard to the maximum draughts, on account of as soon as it is dark in November it is just as dark as it is in December. I don't see that it makes any essential difference whether a dark hour occurs in October or November or December. You have got to light up in each case.

Q. Well, but don't you understand in colder weather you may have gas ranges and gas logs and other things going which you will not have going in October?

A. My experience has showed me that there is more gas consumption for heating in the first cold weather than there is when you get settled cold. That is my experience. When you get settled cold you use coal for heating.

4014 Q. How did you know that this place at No. 1 Platt Street consumed Consolidated Gas?

A. I looked at the meter and saw Consolidated Gas Company property on it or something to that effect.

Q. And the same at No. 2-B Platt Street?

A. No, No. 2-B I referred to. No. 1 I don't think was Consolidated.

Q. Wasn't it Mutual ?

A. I think possibly it was. I don't think it was Consolidated gas for it did not bob with the other. I found there was two gas supplies there, one of which had water in the pipe and the other had not, and I knew there must be some different line of pipe and therefore in the case of No. 2 Platt Street I went and looked at the meter and found it was Consolidated Gas Company's meters.

Q. You understand, don't you, that the Consolidated Gas Company has mains and supplies gas in every street in Manhattan that is opened, including all those in the outskirts as well as those in the thickly populated sections?

A. Yes, I suppose they have.

Q. And you understand that the Mutual and the Standard and the other gas companies confine themselves largely to the more densely populated sections of the city and do not extend to these outskirts streets, or don't you know that?

A. I know the Manhattan Company and the Metropolitan had extended their pipes very much over the city and the new companies arranged to take the new consumption, and I suppose did not extend their pipes so far.

Q. You don't understand the Manhattan extended its pipes to 155th Street and Washington Heights or around there?

A. Within the district that they supply.

4015 Q. I know that. I am talking about Manhattan Island. Now, you say you have made certain tests on heating apparatus, and you find the greatest efficiency in a flat-flame burner to be considerably below one inch?

A. Yes.

Q. Did you read Professor Hallock's affidavit in this case where he quoted Doctor Chanler?

A. Yes, I think I did.

Q. Don't you remember his referring with approval to Dr. Chanler's statement as to the variation in pressure?

A. I think that was based on some peculiar burner that Dr. Chanler used.

Q. Well, it does not appear that it was a peculiar burner, does it, from Professor Halleck's affidavit?

A. No, but it does from the test.

Q. Well, whatever it was, it appears by Dr. Chanler's affidavit, if

Mr. *Mr.* Hallock quoted it correctly, that Dr. Chanler found the greatest efficiency at about an inch and a half, didn't he?

A. Yes, that was evidently a check burner. There is no question about that.

Q. Well, whatever kind of a burner it was, that appeared to be the result, did it not?

A. Yes, I got the same——

Q. Now, as to your experiments with the Welsbach burners, did you try the Kern burner?

A. I used the Kern burner very satisfactorily. I did not try it on this case.

Q. Does not that require a pressure of at least two inches for great efficiency?

A. The Kern burner is constructed on the principle of an exhauster or jet that would give probably a better result at a higher pressure, but it requires low candle-power gas for it. It is not really proportioned for our gases, and for that reason I dropped it out.

Q. Do you mean that the present gas furnished in New York City will not operate the Kern burner satisfactorily?

A. They give a good light but will not give efficiency as compared with the Welsbach for high candle-power gas, surely for the——

Q. For the burning of the same number of cubic feet?

4016 A. No, it will not give the efficiency unless they have altered it within a short period.

Q. But you did find for the Welsbach according to the charts which Professor Hallock presented here, that the greatest efficiency for them was something over two inches, did you not, something like 2.35 inches pressure in one case?

A. According to Hallock, no, I did not find that. I found just as good results with one inch as with higher, by careful adjustment, by watching the photometer; I adjusted by the photometer, you might say, by means of adjustments which consumers could not avail themselves of.

Q. Do you mean you adjusted it from time to time as it was burning?

A. I adjusted the gas and air supply relative to each other by watching the effect on photometric screens to get the maximum light.

Q. You never tried to cook by a gas stove, did you, with the pressure at one inch or under?

A. I have seen cooking done all over town and in towns where they had at the stove less than three-quarters of an inch and it was all——

Q. Did you test it youreslf to find out what pressure they had at the burner?

A. Yes, went all around, went all over the city.

Q. Satisfactory and effective cooking and baking, was it?

A. No, it was not satisfactory in one sense, but it did the business.

Q. If you took time enough?

A. It gave ample heat. The only thing was that it required large pressure to heat them through their small pipes, and therefore, they had to put in additional supply pipes. It was a case of deficient house pipes.

Q. When you say that in your pressure tests for gas stoves you took the pressure at the stop-cock apparatus, was the pressure back of the stop-cock?

A. No, between the stop-cock and the jet.

4017 Q. Is not the important thing, in determining the pressure that the Company is supplying, the pressure back of the stop-cock?

A. That is the point so far as the Company is concerned, but the point for testing whether the gas stove will work, at what pressure it is actually working, is taken between the stop-cock and the jet. That is the real pressure on the stove. The other is controlled by the stop-cock.

Q. If the pressure is the same back of the stop-cock as you found in front of it, would it work efficiently?

A. It would work the same if the stop-cock was fully open and regulated further back.

Q. But it would have to be regulated back somewhere?

A. Yes.

Q. You would not expect the same pressure back of the stop-cock all the way back to the main or the Company's works that you get in front of it, would you?

A. That is the way I tested it. I put on an additional stop-cock back so as to open full pressure on the stop-cock of the stove.

Q. Is not the needle and wheel apparatus which you said took two inches the apparatus ordinarily in use in stoves in the City of New York?

A. No, I think not. I think on the contrary it is the stop-cock. All I have seen have been stop-cocks. I have not seen a single needle valve stove in use. When I looked in the Consolidated Gas Company rooms on 42d Street, I did not notice them there. I approve of that form and was rather surprised not to see any.

Q. Does it not make a difference how large the burners are or how many there are in use in a gas stove as to pressure?

A. It makes a difference as to the size of pipe required to the stove, yes.

Q. I am talking about the ordinary size of pipe which you find in the ordinary stoves?

A. The pipe should be large enough to not draw down unduly.

4018 Q. That is not the question.

A. What was the question?

Q. (Question read as follows: Does it not make a difference how large the burners are or how many there are in use in a gas stove as to pressure?)

A. The pressure on the stove stop-cocks or valves will go down according to draft. If you have one burner lighted it might draw down one-tenth and two burners might draw down two or three-tenths, according to the size of them.

Q. When you say that between an inch and two and a half inches you can regulate pressure as well as at any other limitation, you mean regulate it where?

A. Either at the stove or at the burner. But it would be better to restrict the variation in the house-pipe pressure to a less amount than an inch and a half. That is a very large allowance I think.

Q. If you have pressure sufficient at the meter or if it is too great you can reduce the pressure, can you not, either by turning the stop-cock at the meter or by turning your keys at the burner.

A. The stop-cock at the meter would be a very poor regulation.

Q. Well, it could be done, could it not, if you wanted to reduce it to a certain flow?

A. In my experience I have heard that proposed but I never saw anybody—never knew of its being carried out satisfactorily, for every time you light an additional burner or when the pressure varies outside it would require you to go down and regulate the stop-cock again.

Q. If you regulated it to a minimum point or to a point where it would be sure to let through all you required, you could regulate it within those limits at the meter, could you not?

A. If you had exactly the same number of burners going in use you could.

Q. Assume any number of burners you please, you could regulate at the meter the amount of gas which might be required for a 4019 particular number of burners, could you not?

A. For one given number of burners, yes, that is, in use.

Q. In other words, if there was a constant excess that excess could be cut off at the meter cock, could it not?

A. Not satisfactorily.

Q. Well, it could be cut off there, could it not?

A. I have known it being tried many times, but I never knew of a satisfactory regulation at the meter cock.

Q. Don't you think it could be as satisfactorily regulated at the meter cock as it could be a mile or two miles away at the company's works?

A. Not by a good deal. The variation on the company's mains is what requires regulation, and the other will regulate itself if the main pressures were regulated.

Q. Well, it would not be satisfactory to regulate it at the meter cock because there is not that constant excess to which you have testified. Is not that the fact?

A. The meter cock will stay right at one spot and it is, in my opinion, impossible to regulate any varying consumption at the meter cock.

Q. That is just the point, this is varying consumption, but the question I am asking is this. If the excess pressure were constant and did not vary in the mains on account of consumption, then you could regulate the supply at your meter cock, could you not?

A. The burners remaining the same number in use, yes, if you had just the same number of burners in use and the pressure on the mains or at the meter cock remained the same you could bring it down at the meter cock.

Q. You cannot expect the company to regulate the number of jets which shall be used in any house.

A. I expect them to regulate the pressure at which they are used——

Q. If there is not pressure enough to deliver to the consumer the amount of gas which he requires and no pressure fitted for 4020 the efficient operation of his apparatus, there is no way he can get it, is there?

A. Enlarge his pipes.

Q. Assuming his pipes are of reasonable size to begin with?

A. In my experience that is just where the trouble is. They put more consumption on the house pipes than the house pipes are fitted for.

Q. You don't think the companies ought to take that into account at all in delivering gas to the tens of thousands of buildings in New York City, do you, but ought to deliver pressure exactly as though all the house pipes were large enough, is that right?

A. All companies have rules and regulations about house pipes and ought to see them carried out, that is sure.

Q. But the company has not any regulations as to house pipes that you know of in this City, or any power of enforcing the use of house pipes?

A. Yes, sir, it has. There is just where the trouble is.

Q. You think it has?

A. I am certain every company has.

Q. Will you point out any regulation in the laws of the State of New York which has escaped my notice, providing that gas companies may regulate the size of house pipes?

A. Yes, sir; through their inspectors they have absolute control of it and assume it always.

Q. Will you point out to me the statute which gives them the power to regulate pipes in the City of New York?

A. It is in their own rules and regulations.

Q. Oh, well——

Mr. Kirby: He says the company has rules and regulations in regard to house pipes.

Q. I want you to point out to me any power existing in the gas company by virtue of the laws of the State of New York to 4021 regulate the size of house pipes. Now, can you do that?

Mr. Kirby: The witness is not a lawyer.

A. I don't know the laws but I know as a matter of fact they would not turn on gas on inadequate pipes knowing there would be dissatisfaction.

Q. You don't know what the requirement of the laws of the State of New York is as to the company's being compelled to deliver gas to the consumer along the line, do you?

A. I know that in regard to a great number of companies——

Q. Do you know anything about the laws of New York in that regard?

A. I don't know any specific directions of the law requiring them to furnish gas to inadequate piping. I should think it would be a very crude law that would do it.

Q. Don't you know that great numbers of the buildings in the City of New York were constructed long before the use of Welsbach burners and gas stoves came in?

A. Yes, sir.

Q. Now, do you know of any ideal house piping scheme that provides for each 1-10th fall in pressure for fifty feet?

A. I know of lots of adequate house piping schemes and have seen them carried out, too.

Q. Would it be your advice that the house piping of the City of New York should be done over again wherever the pipes are not of large size and that the company should refuse to supply gas until that is done?

A. They don't require to be done over again. It requires merely an adequate pipe taken from the supply to, for instance, the cooking stove or——

Q. Is it your view in making up your mind on this that the company has any right to shut off gas to a consumer so long as the consumer pays his bills, no matter what the size of the house pipes is?

A. I don't know how that is, I should shut them off until they supplied sufficient pipes.

4022 Q. Well, you would get into a great deal of trouble if you did, I can assure you of that, from experience.

A. I would not think they would compel me to put a pressure on to those which were inadequately piped.

Mr. Kirby: This seems to me to be entirely outside the line of cross-examination.

Mr. Mathewson: I do not think so. He suggests a scheme for house-piping, and we want to find out how it would work.

Q. You said that a blow-pipe action may run a Welsbach to three times its ordinary efficiency. Is not the principle of the gas stove such that the same action would increase the efficiency of a stove?

A. Not noticeably, no. The pressure is too light there. If you increase the pressure until you did that, that blow-pipe action might shorten the flame and increase the intensity of it. That is observed in all sorts of blow-pipe appliances.

Q. It depends does it not, Mr. Edgerton, a good deal on what kind of a burner you use, whether you can get the highest efficiency under one inch or above one inch, even so far as flat-flame burners are concerned?

A. The point of highest efficiency in all flat-flames I have tried is one tested at the point of ignition and is almost identically the same. I should not think it differed to the extent of a fiftieth of an inch.

Q. Not even if it is a check burner?

A. Of course the check burner does not give the pressure at the point of ignition. It is restricted there.

Q. In other words you reduce your pressure by the check?

A. Yes.

Q. And in that case you would get just as good a result with the

4023 pressure in the main at 2½ inches as you would with an unchecked burner when the pressure in the main was an inch, would you not, if you checked it properly?

A. You could but the loss of efficiency would vary with the pressures in the same manner as it does with the unchecked burner. It does not put the consumer in any better position so far as fluctuations of pressure are concerned.

Q. You cannot furnish any system, can you, where the consumer of gas upon a system of mains like New York City will always maintain a uniform pressure at his burner, if he depends upon any possible pressure that the company may put on at its works?

A. You can. Over in the City of New Orleans I put the highest fluctuations at less than five-tenths of an inch.

Q. I am not talking about the amount. I say there is no possible system in view of this differing draught of consumption upon the mains of a company by which if the consumer leaves his apparatus open he will at all times have a uniform pressure at his burners, is there?

A. I think there is just such a system.

Q. So that he will have an exactly uniform pressure at his burner all the time?

A. Within a very small variation, yes, sir.

Q. Well, there will be some variation, will there not?

A. Very slight. It is not necessarily large. I have seen——

Q. But there will be some variation, will there not?

A. A very slight variation.

Q. Do you mean to say, Mr. Edgerton, that you think there should be no regulation of pressure at all between the works of the company and the tips of the consumer?

Mr. Kirby: He has not stated that.

A. I think where there are great differences in elevation that there should be district governors, certainly.

4024 Q. Well in buildings, high buildings, there will be a great difference in pressure between the first and upper stories in that case, will there not?

A. Yes, not great, but——

Q. And will there not be a different pressure practically for every consumer in the district, if there is no regulation by any consumer between the works of the company and the burners of that consumer?

A. There would be a difference in pressure, considerably, in a very high building, but if it was a uniform pressure it would not make much difference because he could adjust *to* it.

Q. And would not it be true that the consumers nearer the works would get a higher pressure than the consumers at the farther end of the district, the consumption remaining uniform?

A. They might have a higher pressure and probably would.

Q. So, would it not be true that, taking a district, if there was no regulation between the works of a company and the burner of any consumer, the consumers as between themselves would all have varying pressure?

A. Not by a proper regulation at the works, there should not be but a very small variation. I have seen it regulated during the burning hours two-tenths or three-tenths of an inch at times.

Q. Oh, at times. That is another proposition.

A. Well, I mean at times when it was difficult to do so. I mean at a maximum variation. I could point out places where it has been regulated within that.

Redirect-examination by Mr. Kirby:

Q. You have testified in reference of these charts that certain of the readings were made when there was no gas being taken from the pipes to which you had your instrument attached and that in those instances the pressure readings show the pressure in the service mains with the exception of such allowance as might have to 4025 be made for difference in elevation between the service main and the place where your instrument was placed. In other readings the charts show a variation, in some instances considerable. And these you have stated to have been occasioned by one gas jet or two gas jets being lighted, in other words, the gas being drawn from the main. Is it your opinion that such a change in pressure as is indicated on the chart from that source is due to the interposition between the service main and your instrument of the meter and the house pipe and if there were a branch pipe; in other words, of everything between the service main and your instrument?

A. Yes, those variations that I note on the charts, some of them abnormal by reason of some obstruction in the meter, are all caused by interferences of that kind. There is no variation there, that is, of any serious amount, caused by variation on the street main. All those ups and downs of large extent are by reason of small house pipes or stiff meter or water in the pipe.

Q. That is, in Chart KK-1, at the hour around six o'clock there is a fall of quite a fraction of an inch noted upon the chart. In your opinion, would that apparent decrease in pressure have registered if your apparatus had been attached directly to the service main?

A. No, that is due to the obstruction caused by the meter being out of order or some other obstruction of that kind.

Q. That is, to some resistance between the service main and the point where your instrument was attached?

A. Yes.

Q. You have stated in your opinion the Consolidated Gas Company could use such charts as these in an effort to better regulate its pressure. Do you mean by that that these charts taken at frequent intervals would be a means of indicating what the pressure would be at any particular point, whether it was uniformly high or uniformly low, and therefore whether the pressure in that dis- 4026 trict could be governed by means of the pressure recorded on the chart?

A. Yes, we use those charts as a means of finding out not only whether the governing is accurate or whether it is deficient and also as to whether the mains are adequate. Now, this chart here, Exhibit KK-2, would indicate that the pressure could be cut down, well, say, half to three-quarters of an inch without causing any trouble with consumers. And that the maximum line running above the two and one-half inches could be kept well within it. It is a question of regulation there. Now, its effect on the lower customer by pulling it down would be inappreciable except for the resistance of his meter or some obstruction in the pipes there. Half an inch could be cut off of the lower point without interfering with the efficient use of gas. And that half an inch taken from the higher point would bring it well within the two and one-half inch maximum.

Q. And so from an observation of that chart, or by a series of charts at the same point, the company could determine whether or not it would be advisable to increase or decrease the pressure so as to keep within one inch and two and one-half inch limits?

A. Certainly, they would be a guide to accomplish it. I am surprised that they have come so close to it as they have.

Q. You have spoken of the maximum hour. What do you mean by the maximum hour?

A. The maximum hour is equivalent to the peak of the load, that is, the hour during which the maximum amount of gas is flowing in the pipes or from the holders.

Q. This might or might not be upon the day of greatest consumption, might it not?

A. No, it might be wholly apart from the day of greatest consumption. The December consumption is great simply because the hours are lengthened, not because there is more gas being consumed in any dark hour of December. In fact, the maximum hour might fall and probably in New York, would fall in November. It would fall at the time of the maximum demand for these temporary heating apparatuses, such as gas logs and stoves, which would not be used in the severe cold weather. 4027

Q. Mr. Mathewson has asked the Master to look at charts KK-1 and KK-2. Will you point out to the Master what you consider are the variations in those two charts which are same?

(Witness here explains to the Master).

Q. Reference has been made to your connection with the New Orleans Gas Works and the installation of the water gas plant there. Did you operate that plant?

A. Yes, sir; I operated it for about six months and was in consultation with the operation for a period of two or three years afterwards.

Q. During the time you were employed by the United Gas Improvement Company the business which you have spoken of on cross-examination as your own business was the company's business, was it not?

A. Yes.

Mr. Kirby: That is all I have on that subject, Mr. Master. There is the matter of oil which was gone into at some length on cross-examination which I do not desire to take up at this time, not having gone into it at all on direct-examination, and I therefore ask that

I may have the right to take up that subject more *in extenso* when we come to consider it in relation to the cost of gas.

Mr. Mathewson: I have no objection.

Recross-examination by Mr. Mathewson:

Q. Is that plant in New Orleans, that water gas plant, in operation yet?

A. No, there have been various changes made. It has operated under several different plans since then.

4028 Q. And when you refer in these charts to the pressure being brought within a certain range you mean at that particular point, do you not?

A. Yes.

Q. Now, don't you know that of these two sheets, Exhibit KK at 125th Street and the other at Columbia College, one is on the Standard mains and the other is on the Consolidated Gas Company's mains?

A. They are connected together.

Q. And do you know whether the pressure comes from the same point or not?

A. Absolutely certainly it does.

Q. You concluded that it does from looking at those charts, do you?

A. Absolutely. I did not take——

Q. Don't you see in looking at these there is a difference of about fifteen minutes in superimposing these to reach the nearest identical lining of curves?

A. No, I do not notice that at all for the plot——

Q. Just keep them on the curved lines there exact. In other words, those lines curve and you must keep these, if you get them exactly at the right point of the proper hour on the same curves?

A. No, sir, not by a long stroke.

Q. Oh, yes, you must. You cannot run them up and down on these curved lines without running them on the curve?

A. That depends where the clock work or the pen has been set. You cannot make those lines coincide. They never do, for you could not, just the way I adjusted that instrument, I could not bring——

Q. Well, we will make that clear later ourselves, if it is necessary. What was the nature of the gas stoves on which you made your tests?

A. I made them on pretty much all the prominent stoves, the needle stove, the stop-cock stove of the——

Q. Can you name a particular make?

A. Detroit Jewell, the Chicago Jewell, and the Stamford.

Q. And the Phœnix?

A. I don't remember trying the Phœnix in regard to pressure at the point of ignition, no.

4029 Q. How long since you have actually operated a gas works directly and what was the last one you did operate?

A. I am operating it now you might say.

Q. I mean operating, the actual manager, working actual manager of a gas works?

A. In which I direct what shall be done and shall not be done?

Q. I do not mean merely a supervisor; I mean a manager of a gas works. You know what that is?

A. I have never been a figurehead. I actually managed the works and directed it, but without official position. You understand a man as consulting engineer may really have the management of the works so far as material results are concerned.

Q. Let us have the latest one you have actually managed and the date?

A. Well, the Danbury Company, I have always been consulted with about the details.

Q. Are you the manager of the Danbury Company?

A. No.

Q. Who is the manager?

A. Mr. Cowperthwait.

Q. What is the last works which you actually managed?

A. I got a letter from him day before yesterday——

Q. That is not the question. Won't you answer the question, what is the latest works at which you were actually manager?

A. Danbury. I am actually the manager there in all its details, so far as the operation is concerned. There is not a step taken which is not referred to me.

Q. You have charge of the regulation of pressure there?

A. To a certain extent. I have recently made alterations in regard to that. I told him to lay a larger pipe. We regulate from the center of the village, and I told him——

Q. Are you on the spot, the operating manager of that plant?

A. I am not on the spot there now.

Q. I know you are not. You understand what I mean.

A. I think they refer every detail of management to me. I have letters in my pocket now in regard to it if you want to see them. 4030

Q. What are the duties of this management?

A. To see that things are carried out in right shape.

Q. Aside from Danbury what is the last one you have actually managed before that?

A. Asheville, North Carolina, just a short time and Faribault, Minnesota, Butte, Montana, Schenectady, advice in connection with it, the General Electric plant——

Q. That I have not asked you about, advice in connection with it. I am now talking about operating manager.

A. So far as that is concerned, no manager operates the plant in the sense you probably wish to state.

Q. Then you have not been an operator have you, put it that way, you have not been an operator of the works, is that right?

A. In many cases I have run the works with my own hands.

Q. In Danbury?

A. Yes, turned it off and regulated it while I was experimenting.

Q. Yes, but generally speaking, while the works are running you have a manager there, haven't you?

A. Yes.

The MASTER: I want to call the attention of the counsel for the defendants that their time expired on the 30th of October and although that matter was brought to their attention at the time and it was stated that it would be necessary to make an application and have a certificate from me, it has not been done. The time cannot be allowed to remain open in this way.

Adjourned to Thursday, November 15th, 1906, at 10.30 A. M.

Last Exhibits:

Complainant's, 256.

State's, 88.

4031 Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,
vs.
JULIUS M. MAYER, as Attorney General of the State of New York; WILLIAM TRAVERS JEROME, as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIAN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and THE CITY OF NEW YORK, Defendants.

Before Arthur H. Masten, Special Master.

NEW YORK, *November 19th*, 1906.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Page, Mr. Burr.

4032 At the hearing of November 7th Mr. Kirby, on behalf of the defendants, requested an adjournment until the following Monday, November 12th, as his witnesses were not yet finished with the necessary examination of the plants and papers of the complainant. The adjournment requested by Mr. Kirby was granted, but, at the suggestion of the Master, and for his accommodation, it was extended until Thursday, the 15th inst. Subsequently, because of the engagements of the Master, the hearing was further adjourned until this morning, the 19th inst.

Senator Page, on behalf of the State, now requests an adjournment until Wednesday, November 21st, on the ground that his witnesses are not yet ready to testify; and an adjournment is therefore taken to Wednesday, November 21st, 1906, at 10:30 A. M.

NOVEMBER 21ST, 1906.

Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Page, Mr. Kirby.

HENRY H. EDGERTON resumed.

The MASTER: I want to call attention of counsel for the defendants, now for the third time to the fact that their time to take testimony expired some time ago, and I have not yet been furnished with the papers on which to grant a certificate.

Mr. Burr: I might have saved that announcement if I had been here a moment sooner. Here are the papers.

4033 The Master: I want to say to all counsel, in view of the time we have necessarily lost here recently, that I hope we can get started promptly every day hereafter. Our sessions are not any too long, and if we can get started every morning at 10:30 it will be of some assistance.

By Mr. Kirby:

Q. In your previous testimony you have given us the names of various plants which you have installed and of which you have put in the distributing system. What was your custom in laying the mains and services of those systems in reference to the depth below the pavement which you placed the mains?

A. As most of the works which I have erected were intended for the use of water gas, and as early experiments in regard to those gases showed me that they would stand cold and compression with less serious loss than was the case with coal gas, I took advantage of that fact to incur as little expense in laying the mains as possible and rarely, excepting in exceptional cases, went below the depth of two feet from the top of the pipe, below the surface of the ground or pavement.

Q. And you have laid mains in the streets to carry water gas or a mixture of water and coal gas at an approximate distance of two feet below the surface?

A. Yes, sir.

Q. Have you laid such pipes in climates as severe as that of New York, in winter?

A. Yes, sir. I laid pipe in that line in Minnesota, which is quite as severe as New York.

Q. When pipe was laid by you at this distance below the surface did you find any trouble resulting therefrom during the cold weather?

A. No, sir. I made a number of very severe tests in regard to the stability of water gas subjected to cold. In one case I 4034 remember pumping it at a pressure of forty-five pounds a distance of three miles where the pipes averaged less than two feet below the surface, and then blowing it back from the neighboring town, and in trying it on the photometer found there was no perceptible loss. These experiments were reported in a case before the Corporation's Committee of the Connecticut Legislature, and I think were unchallenged as regards that point.

Q. Did you find any trouble in your service mains owing to the cold when your mains were laid at this distance below the surface?

A. You speak of the service pipes?

Q. In the services.

A. I found that a rather shallow main is a preventive of trouble in services rather than adding to it. If there is a slight amount of moisture in the gas, the moisture is taken out in the cold main and less trouble ensues in the service pipe. I had an opportunity to compare my plants with those of the Minneapolis Gas Company, and in Minneapolis, owing to the cold weather, the mains were laid at a great depth, from five to six feet; and comparing the service troubles in Minneapolis with those of Faribault, a town of about 50 miles from Minneapolis, I found that they had relatively ten times the trouble with services and frozen lamps that we had in Faribault; and in talking the matter over with Mr. Brown, who is president of the Minneapolis company, I called his attention to the fact that the moisture in the gas was frozen out in the shallow mains, in the main pipe, and therefore did not carry on to the services; the mains being of large dimensions, the deduction due to moisture was not noticeable. I compared our complaints of frozen services with those of Mr. Brown's and he admitted that he had been probably on the wrong track in burying his mains so deep in the ground.

4035 Mr. Mathewson: I move to strike out that last statement of Mr. Brown's.

The Master: Strike it out.

Mr. Page: You mean what Mr. Brown said?

Mr. Mathewson: Yes.

Q. And in Faribault how deep below the surface did you place your mains?

A. In Faribault the practice had been to place the mains deep, like in Minneapolis, but I changed that. I found there that the deep pipes were the ones that gave the trouble in services and the shallow ones did not.

Q. And you changed such mains to shallow mains?

A. Some of the main pipes I raised as opportunity afforded to a higher level.

Q. How did you find the trouble in the services from such mains raised to a higher level as compared with services from those mains which were not raised to the higher level;

A. I noticed right along in all my experience with water gas the shallow mains gave less trouble from freezing as regards the service pipes.

Q. Have you in your installation of plants and inspections of the various works around the country observed any instances where mains carrying gas have either been placed a very small distance below the surface or exposed to the air?

A. I have noticed that engineers generally now do not regard it as necessary to shield mains as carefully as they used to. I noticed in Baltimore that the 16-inch mains, I think it is 16 inches, that convey the gas from Sparrow Point to the city of Baltimore are exposed quite freely to the open air, that is, laid above the ground and across trestle works, and along trestle works entirely exposed to the air.

Q. Is this exposure of gas pipes to the open air one which is customary around gas works?

A. Yes, I frequently see exposed pipes around the works
4036 where it is difficult or expensive to keep them under cover.

I also notice that the gas holders are now generally exposed to the weather. The practice of covering gas holders with brick buildings has almost ceased, and that any gas which would stand the cold of a gas holder in connection with the cold water contained in the gas holder tanks would certainly stand a temperature in the main pipe with two feet of soil covering them. I will say, however, that there is according to my tests an appreciable deposition of illuminating matter in the holder, as shown by the fact that in the warm weather after the cold spells the candle power of the gas will rise considerably above the normal unless more new water gas is put into it.

Q. Have you noticed in the Borough of Manhattan any exposed service pipes which are not protected against the weather, but are exposed to the open air?

(No reply.)

Q. Are not the lamp posts themselves such indications?

A. Yes, the lamp risers, the risers in the lamp post are exposed to extreme cold; the service pipes generally are covered or protected. They sometimes pass through open areas, where they are exposed to cold, and when the gas is moist there is the point where we generally find the frost gathers in severe weather.

Q. Could you make any deductions from trouble or lack of trouble in lamp posts as to whether or not there would be trouble in the gas mains if the same were placed closer to the surface than three feet or below frost?

A. The same holds good in regard to lamps freezing out in winter as regards the service of consumers; gas which has been previously dried by the cold mains and deposited, the moisture in the mains is less liable to have any moisture left to deposit in the risers of the lamp posts. 4037

Q. Have you made any observations of the depth of pipe of the Consolidated Gas Company beneath the surface of the street?

A. I have within the last two or three months noticed many openings; I could not tell which were the Consolidated pipes. I could recognize gas pipes from other pipes, but I have seen many places where they were about as shallow as I should care to put them.

Q. What do you mean by that?

A. I would judge not over two feet or two feet six inches below the surface of the road. I do not remember the exact localities now, but I noticed quite a number of points where they were shallow.

Q. And you have bought pipe to use as part of the distributing system of your gas works, have you not?

A. Yes, sir; I have bought considerable quantities of pipe. In fact, I bought about all the pipe for the works with which I was connected.

Q. Are you familiar with the various sizes of pipe and costs thereof?

A. Yes, sir.

Q. Are you familiar with what the costs and weights were in 1884, or thereabouts?

A. Yes, sir.

Q. Are you familiar with the cost of digging the trench within which to lay the pipes, and the refilling of the same?

A. I have taken particular notice of cost in regard to laying of the mains to the smallest details.

Q. Have you made inquiries and informed yourself as to such points in the Borough of Manhattan?

A. I have in regard to certain of the prices, and have taken notes in regard to the quantities that are found of excavation and earthwork, that is being done to lay mains at various points, more particularly down in this salt water main system.

4038 Q. Are you familiar with the cost of replacing the pavements, and have you informed yourself relative to such costs in the Borough of Manhattan?

A. I have consulted with various parties in regard to the costs; yes, sir.

Q. Have you made certain calculations, Mr. Edgerton, in reference to the cost of pipes, and if so, will you state for me your computation, based upon the size and number of feet of pipe as given by Mr. Simpson at page 288 of his testimony, taking them up in order?

A. Yes, sir; I have taken the lengths of mains as shown in Mr. Simpson's testimony and have tabulated them according to sizes. I find there is a slight difference in my total from his of 12,000 feet, which I have not had an opportunity of reconciling.

Q. Will you give us——

A. Mr. Simpson's length of main is 4,344,849 feet. The addition I make is 4,357,279. There is probably an error on my part, which I have not had a chance to correct.

Mr. Mathewson: Yours is higher than his total?

The Witness: Yes, sir; slightly higher. I have divided the mains and lengths as nearly as possible from Mr. Simpson's testimony of those which are now used laid previous to 1884, and those since 1884, and I find that of those laid before 1884 there were two million feet and of those laid and in use since 1884, as near as I can arrive at it from the testimony, 2,349,000 feet.

Q. And you assumed that there were 468 miles of new mains since 1884?

A. That was about the basis of the division.

Q. In other words, you took the testimony of Mr. Simpson as given at page 289?

A. I presume that is the page. I tried to decipher his figures——

4039 Q. Where he states that out of 822 miles 468 miles are new mains which have been laid since the consolidation?

A. Yes.

Mr. Kirby: I wish, in making these assumptions, if there is any correction to this testimony, you would call my attention to it.

Mr. Mathewson: I cannot, offhand.

Q. How many feet, Mr. Edgerton, have you used of 1½ inch pipe?

A. Well, I have left out the 1½ and 2 inch mains. There is a small amount, and of no consequence. I have never, in fact, regarded a 1½ inch pipe or a 2 inch pipe in the light of a main pipe in a large plant. Those two items are left out.

Q. Of the 1½-inch pipe I note there is 1,407 feet and of the 2-inch pipe 635 feet. You have disregarded that in your computation?

A. Yes.

Q. Of the 3-inch pipe, at page 288 it is given as 227,741 feet?

A. 222,741 feet, I have it.

Q. That is right; I misread it. Did you consider that as new main or old main?

A. I took 100,000 feet of that as old main and 122,741 feet as new.

Q. What did you do with the 4-inch pipe?

A. I divided that on practically the same lines—250,000 feet of old and 327,469 feet of new.

Q. That makes a total altogether of 557,469 feet, does it not?

A. 577,469 feet.

Q. That is where you have made the error. It is 557,469.

A. I had not an opportunity to go over these figures and discover where that difference was. I assumed that it was in the dividing of these mains.

Q. In the 5-inch——

Mr. MATHEWSON: Will you give me that 3-inch again? Was it 100,000 of old and 122,741 of new?

The WITNESS: Yes.

4040 Mr. MATHEWSON: And the 4-inch was 150,000?

The WITNESS: 250,000 of old and 327,469 of new.

Q. Now the 5-inch?

A. I wish to explain that this division is pro rata to the total mileage; it is not derived from the testimony in any other way than prorating each size according to the amount of new mains and old mains in the ground. It is a matter of small consequence, the only difference being that to the old main I applied the old weights of mains and to the new main I applied a little heavier weight of main, because years ago we used lighter mains than we do now.

Q. Now the 5-inch, Mr. Edgerton, what division did you make?

A. I have not got that. There was a very small amount of it, 1,799 feet.

Q. And that you ignored?

A. Yes.

Q. The 6-inch main; what division did you make?

A. 1,000,000 feet of old main and 1,129,000 feet of new.

Q. The eight-inch main? What division did you make?

A. 250,000 feet of old main and 278,000 of new.

Q. And of the ten-inch?

A. 30,000 of the old and 41,286 of new.

Q. And of the twelve-inch?

A. 150,000 feet of old and 171,536 feet of new.

Q. And of the sixteen-inch?

A. 45,000 feet of old and 53,900 feet of new.

Q. And of the eighteen-inch?

A. 12,000 feet of old and 17,633 feet of new.

Q. And of the twenty-inch?

A. 80,000 feet of the old and 98,805 feet of new.

Q. And of the twenty-four inch?

A. 20,000 of old and 25,956 of new.

Q. And of the thirty-inch?

A. 60,000 feet of old and 71,583 feet of new.

4041 Q. And of the thirty-six-inch?

A. 11,000 feet of old and 11,242 feet of new.

Q. To these old mains you gave certain weights, did you not?

A. Yes, sir.

Q. And to the new mains you gave certain other weights, did you not?

A. Yes, sir.

Q. Now, will you kindly give us the weights which you used for the old and the new?

A. The old mains I took, as follows:

3-inch main, at 11 pounds per ft.
4-inch main, at 17 pounds per ft.
6-inch main, at 25 pounds per ft.
8-inch main, at 38 pounds per ft.
10-inch main, at 50 pounds per ft.
12-inch main, at 58 pounds per ft.
16-inch main, at 100 pounds per ft.
18-inch main, at 120 pounds per ft.
20-inch main, at 140 pounds per ft.
24-inch main, at 185 pounds per ft.
30-inch main, at 270 pounds per ft.
36-inch main, at 360 pounds per ft.

Q. What was the unit you used to bring forth that result for these old mains?

A. Why, I used those mains which were in general use in the earlier times of gas pipe laying, as iron was high during the seventies and they had a custom of making the mains rather light, and it seemed to have continued. Now that iron is cheaper they seem to have increased the weight of the mains quite a percentage.

By Mr. **Mathewson**:

Q. Who are "they"?

A. The iron founders.

By Mr. **Kirby**:

4042 Q. In reference to the new mains, what weights did you use for the various sizes?

A. They are as follows:

3-inch main, at 12 pounds per ft.
4-inch main, at 18 pounds per ft.
6-inch main, at 30 pounds per ft.
8-inch main, at 44 pounds per ft.
10-inch main, at 55 pounds per ft.
12-inch main, at 72 pounds per ft.
16-inch main, at 110 pounds per ft.
18-inch main, at 130 pounds per ft.
20-inch main, at 150 pounds per ft.
24-inch main, at 200 pounds per ft.
30-inch main, at 260 pounds per ft.
36-inch main, at 360 pounds per ft.

These large pipes demanding about the same as previously.

Q. On page 324 of the testimony Mr. Simpson stated that "the price of pipe in 1884 was $25.00 and something a ton—I will give you the right figures. In 1885, as near as I can get to it, the price of pipe was $25.50, and December, 1905, $28.90; a difference of $3.40 per ton of pipe."

Mr. **Mathewson**: It should be $35.00 in 1884 instead of $25.00. That is a clerical error. In other words, in 1884 pipe was higher than it is now. In 1885 it was a little lower.

Q. Now, Mr. Edgerton, are you willing to accept the figure of $28.90 as the cost of pipe to-day, or, if not, what figure did you use?

A. I used as the cost to apply to these mains $28.90, but I used the short ton instead of the long ton in calculating the cost—short ton of 2,000 pounds.

Q. And you consider that to be the price of the main alongside of the trench?

A. Yes, sir.

4043 Q. That is for the 2,000-pound ton?

A. Yes, sir.

Q. Now, have you upon that basis figured out your price per foot for your new and old pipe?

A. Yes. I have added the total weight in pounds calculated on the basis stated of old pipe and the new pipe together, and arrived at a figure of 210,036,966 pounds, which in short tons would be 105,018,498, which at $28.90 would give an amount of $3,035,034.65. I add to that 10 per cent. for crosses and Ts and specials of various kinds, and I have not had time to go into a computation of specials more in detail than that, and assume an addition of ten per cent. of the total weight would cover the cost of specials and the difference in price between specials and straight pipe.

Q. Ten per cent. would amount to how much?

A. I didn't add it on in that place. With the ten per cent. added it would amount to $3,338,538.11.

Q. Which figure represents the total cost of the pipe, including all specials, all wastage or breakage and everything which goes to make up the amount which would have to be expended to buy the pipe necessary to replace the number of thousand feet of mains you have indicated?

A. Yes, sir.

Q. In taking ten per cent., did your experience lead you to believe that ten per cent. of the cost of pipe would be sufficient to take care of breakage, wastage, specials or such other charges which had to do with the cost of material in the pipe?

A. I should think it would. I do not generally figure it that way. If I had time I would go into it more in detail, taking the different sizes of pipe and adding the specials required in accordance with the distances between streets and making due allowance for breakage in such specials as might be needed for obstructions in the laying
4044 of mains, which method would be more accurate, but I think ten per cent. would more than cover it.

Q. In your opinion, then, if you went into it in the manner which you have suggested, your experience would show you that it would probably be less than ten per cent.?

A. I think so.

Q. In this estimate did you take into consideration the 27.2 miles of mains which are not in use at the present time?

A. I did. They are included in this estimate. In fact, I didn't know which sizes to throw out on that 27 miles of main as lost. I left them in.

Q. Will you assume that the average of those sizes were 6-inch mains and calculate how much difference that would make in your total of three million and odd dollars?

A. It would be natural to assume that there were some of the smaller mains thrown out, and I think it would probably average as low as 6-inch main.

By Mr. **Mathewson**:

Q. Probably average lower, wouldn't it?

A. Well, possibly lower. I think that very little 6-inch main would be thrown out.

By Mr. **Kirby**:

Q. Do you think an assumption that it was 6-inch main would be a fair one?

A. I think that it would be large enough. I don't think that much 6-inch main would be thrown out of this. No, I cannot say——

Q. Well, if this statement were placed before you, that there were 27.2 miles out of this 822.2 which are not in active use, what would you, as a man of experience in those matters, consider as a probable average size of the main represented by the 27.2 miles?

4045 A. Well, I think it would be safer to take the average of 4-inch rather than 6, considering that——

Q. Well, will you assume then four inches?

A. I think that would be safe.

Q. Now, will you make for us a calculation showing how much deduction that would make from your three million and odd dollars?

A. I will make it roughly.

Q. Make it first roughly.

A. Subject to correction?

Q. And then after the testimony is printed you can make it with more refinement, and if you find it different we will request to have the testimony corrected accordingly. I take it that the sliding rule will be accurate within a percentage which is fair.

A. Well, that probably, within one per cent., would amount to 2,472,000 pounds. $33,500.00. I have assumed this to be the old pipe, naturally.

Q. Now, will you make that deduction, Mr. Edgerton, from your other total and see what the result is?

A. Deducting that from the previous total, it leaves $3,305,038.11.

Q. You have made certain computations relative to the cost of excavating the trench in which these mains are laid and the laying of the main therein and the refilling of such trench, have you not?

A. Yes, sir.

Q. In such computation did you use certain size of trench for a certain size of pipe?

A. Yes, sir. I took off the size of cuttings in the asphalt and width of cuttings, observations made through the city and where work is progressing at present, and as to the depth, I compared—or, rather, as to the size of the ditch, I compared my own experience with that of some of the best authorities, and I converted the excavating into cubic yards of lineal foot of pipe, and made out a table of the
4046 cubic yards of dirt that would be removed of paving for each size of pipe.

Q. Now, first, in reference to the size of trench, what size trench did you use for 1-inch and 2-inch pipe?

A. I should use practically the same as the 3-inch, but I have not included that in my estimate.

Q. What size did you use for the 3-inch?

A. The width is 1.833. I converted it into decimals instead of inches; and the depth of the trench of 2.25. That gives cubic yards per foot, .152; 4-inch, the same width, depth 2.33 cubic yards per foot .158.

By Mr. **Mathewson**:

Q. How wide is the 4-inch cut?

A. 1.833 feet. The remainder are as follows:

Inch.	Feet wide.	Depth of trench.	Cubic yards per foot.
6	1.833	2.5	.169
8	2	2.66	.197
10	2.08	3	.231
12	2.33	3.20	.276
16	2.33	3.33	.287
18	2.33	3.53	.304
20	2.5	3.8	.352
24	3	4	.444
30	3.6	4.6	.612
36	4	5	.741

I have made the width slightly greater than I find for the salt water mains cutting the asphalt. I found in many places where the mains are laid the cut in the asphalt was but two inches clear of the width of the bell, and I took photographs of a number of such cases showing measurements and the state of the surroundings in order to show it more clearly. I can present those in the morning.

4047 By Mr. **Kirby**:

Q. Now these widths of trench which you have used are such which your experience in laying mains has taught you to be proper for the purpose, are they not?

A. Yes, sir. I think they will hold the mains very nicely, and with the allowance I have made for caulking holes I think they can be put together in very good shape in those widths.

A. Assuming that the mains were laid more than two feet below the surface, would you still carry this width of main?

A. Yes, I should not make it any larger. I see the practice here is to cut it a little short of what I have given in regard to these deep salt-water mains.

Q. Now you have spoken of bell holes and such, what do you mean by that?

A. It is necesary to have a space around the end of each pipe in order to caulk the lead into the joints, and we call that space the caulking. My practice has been with small sizes to put together and caulk three joints of 3-inch and three joints of 4-inch on the surface of the ground, on a sort of alignment table, and lower the pipe into the trench. In this manner I get rid of a number of small caulking holes. Coming up to the 6-inch, it is possible to lower two pipes together, but as a general thing I put the 6-inch in in single length.

Q. How are these pipes put together? After they are placed together in the trench?

A. The spigot end of the pipe is entered into the bell and the joint is then yarned solidly to a sufficient depth and a gate then made, the lead poured in, the lead driven tightly home with a caulking tool till a perfectly sound and solid joint is made.

Q. Have you made any allowance for doing such work in computing the size of your trench?

4048 A. I have added ten per cent. to the total excavation to allow for these caulking holes and such extra holes for specials, and meeting cases of difficulties, which I considered ample.

Q. In computing the cost of your excavation and refilling and laying, how great a percentage did you consider as that which would represent the excavation of rock in the trench?

A. I have not finished my calculations in regard to the rock. I have taken Mr. Simpson's figures as to the amount and——

Q. What do you mean that you have taken Mr. Simpson's figures as to the amount; what figures did you take?

A. I understood it was ten per cent., I think it was.

Q. And you have assumed, then that ten per cent. of all your excavation would be in rock? Is that correct?

A. That is part of it. Ten per cent. of the pipes being in rock, and not ten per cent. of the excavation, because there would be the pavement to cut through and loose dirt; I presume the rock at two feet below the surface, there would probably be one-half of it.

Q. Will you kindly explain?

A. Taking ten per cent. of the pipe as being laid in rocky ground, the pavement would first have to be removed.

Mr. Mathewson: How much did you allow for pavement, the depth for pavement?

The Witness: Well, nine inches for the blocks, and I should consider the balance below the paving line as rock, although I doubt whether, when pavement is laid in that manner, whether it is laid down solid on the rock, but possibly it may be. It would have to have a bedding to equalize it.

Q. And of that distance from the bottom of the pavement to the bottom of the trench you assumed that ten per cent. would be rock?

4049 A. Yes. As I have stated, I have not calculated that out, but that is the basis on which I should proceed to calculate it.

Q. And you calculated out your rock excavation and refilling?

A. I have.

Q. And you used 90 per cent. of the total material excavated as being earth, did you not? Is that so?

A. I think I calculated the whole of it as dirt, but I think I deducted ten per cent. subsequently. I have not aggregated as yet these figures, for the reason I have yet to add in the lead and yarning, but I think I deducted from the total of excavation ten per cent. for the rock portions; at any rate, it should be deducted.

Q. You have made a computation there assuming that the entire amount of excavation would be through dirt, as I understand it?

A. Yes; the computation is entirely based on dirt, and the idea was to deduct from that the ten per cent. which was supposed to be rock.

Q. And then to add to the total the cost of exvacating the ten per cent. of rock? That was your method of operation?

A. That was the basis.

Q. In the excavating of dirt what price did you use to represent the taking out of the material, the placing of the pipe in the ground and refilling of the dirt?

A. I have only the taking out and the refilling; I have not the items of caulking and pipe laying and leading.

Q. Then for digging out the material and refilling, what price did you use?

A. I took that at 67 cents.

Q. Per what?

A. Per cubic yard; per cubic yard.

Q. And do you consider that price to be one which is proper for the present day——

Mr. Mathewson: Just a minute. The witness has had no 4050 experience in New York at all. He says he is merely getting these figures from other sources.

Mr. Kirby: I think if Mr. Mathewson will allow me to finish my question he will find it is quite proper.

Mr. Mathewson: I thought you had finished.

Q. Do you consider that price, Mr. Edgerton, as one which is proper for present day wages, such as you are familiar with them elsewhere and in accordance with such information as you have obtained relative to conditions in the City of New York?

A. I should think——

Mr. Mathewson: Wait a minute. Does that cover the excavating and refilling?

The Witness: Excavating and refilling. It does not cover the carting away of such surplus that the larger sizes might entail. That is the point I had not come to yet.

Mr. **Mathewson**: I object to the question. The witness is not competent.

Mr. **Kirby**: Well, the Master can rule on that when he comes in. And the witness may answer now, I suppose.

A. I consider that ample. I have looked at conditions here in New York to some extent, and with the New York operations and various engineering operations here for a period of 25 or 30 years, and I do not see why it should cost more than that.

Q. Using such figure of 67 cents, what did you find is the cost of excavating and refilling the various trenches for the various sizes of pipe in the ground and the number of *fact* thereof, as you have testified, as used by you in your computation?

A. The total excavation and filling including the 10 per
4051 cent. for caulking the holes and contingencies is 1,005,730
cubic yards which at 67 cents a cubic yard would be $673,852.50.

Mr. **Mathewson**: That does not include any rock and does not include the carting and dumping, does it?

A. No, sir.

Q. Will you give that a little more in detail?

A. I took the length of each size of pipe and multiplied it by the cubic yard factor per running foot and from that computation got the excavation for each size of pipe.

Q. Will you give the total of your excavation for each size of pipe?

A.—

3	inch	39,300
4	"	88,100
6	"	360,000
8	"	104,000
10	"	16,400
12	"	88,700
16	"	28,400
18	"	9,120
20	"	62,900
24	"	20,400
30	"	80,500
36	"	16,500

Mr. **Mathewson**: Will the Master give us a ruling on that previous question?

(Question read).

Mr. **Mathewson**: I object to the question. The witness is not competent. His own experience of wages had in Danbury is not the slightest criterion of what they are in New York. He has
4052 made inquiries, but I do not think he is competent to testify
on the subject.

The **Master**: I think it is evident, that, strictly speaking, he is not competent; his testimony on wages and so forth is necessarily hearsay; he says so himself; but at the same time, I will allow his testimony to stand and take his computation as a whole for what it may be worth.

Mr. **Mathewson**: The whole testimony of the witness, it seems to me, is assumption and speculation, and assuming how much is new pipe and how much is old; I cannot conceive how it is of any value.

Mr. **Kirby**: Here is a man who has laid pipe all over the United States——

Mr. **Mathewson**: He does not know how much is new and how much is old. It is entirely incompetent.

The **Master**: He says he has inquired about as to conditions here and various elements, and there is no opportunity to cross-examine the sources of his information on that subject. His testimony is evidently hearsay, but I will take the computation for what it may be worth.

Mr. **Mathewson**: Exception.

Q. Have you made any comparison of this price of 67 cents per cubic yard with prices you have made elsewhere and prices you are familiar with elsewhere, and if so, what do you find to be the result of such comparison?

Mr. **Mathewson**: Objected to as irrelevant and immaterial.

The **Master**: I will allow that.

Mr. **Mathewson**: Exception.

4053 A. Yes, I have. It is a considerably larger price than I have used elsewhere, and I find, in comparing the standard authorities, that my costs are larger in respect of excavation, and all the items entering in so far are about double the English prices.

Q. In your computations, giving the cost of excavation of rock, what price did you use per cubic yard?

A. I have not computed that yet. I have taken that at $6.00 a cubic yard.

Q. And have as yet to make that computation on that assumption?

A. On that basis.

Mr. **Kirby**: I think we will save time if we could adjourn now and let Mr. Edgerton make his computation on this rock. It is nearly one o'clock.

Mr. **Mathewson**: It seems to me that the witness should have been prepared to testify here, if he was going to testify on this, without taking up so much time by computation and incomplete items.

Mr. **Kirby**: I do not think we can be accused of taking up any time here. There have been no computations made and the testimony has been the result of his computation.

Mr. **Mathewson**: Yes, there have been quite a number of computations.

The **Master**: We will take a recess until 2:10 P. M.

After Recess.

Mr. **Kirby**: Mr. Master, we find ourselves in this position. We have here Mr. Edgerton, who has this morning given the results of all his calculations that he has made thus far. We 4054
have endeavored during the luncheon hour to make certain

other calculations but find that to bring the total of his results we will have to make certain averages on assumptions, which we do not desire to make. Mr. Edgerton states that with the noise from this adjoining building which is being constructed and with the confusion which is apt to go on during the time of figuring that he is apt to make mistakes in simply multiplying and adding and subtracting, and that in one-tenth of the time off the witness stand he can do it better, more accurately and not have it subject to any corrections which he might have to make if he does the figuring on the witness stand. He has his base prices here; he has given his testimony as far as it goes, and while we have no other witness to go on with I really believe it would save time if we could either adjourn for a couple of hours to enable us to make these computations or else to have the cross-examination as to the accuracy of his base figures postponed and then have him present in a table to-morrow morning the result of those calculations which would be upon the figures he here presents.

The MASTER: He has had since the 7th day of November to make these calculations, and it seems to me you should either be ready to go on with the witness or have another witness here.

Mr. KIRBY: I can go on with the witness in the way I have indicated, but it takes up time and gives poor results.

The MASTER: Undoubtedly, but it should have been done before, and I must say it seems to me that counsel are not dealing
4055 exactly fair with the other side or with me to let this case drag along like this, in view of the pressure we are under to finish it.

Mr. KIRBY: We did not expect to go on with Mr. Edgerton to-day.

The MASTER: I know, but there are five or six other witnesses, real estate experts and what not. The complainants closed their case on the 14th of September and you have had since then to get ready, and it seems to me there is no excuse for not being prepared to go on from day to day, especially as we had a recess a week longer than you asked for the last time.

Mr. MATHEWSON: Mr. Hough, your witness, was here this morning, prepared to go on with his testimony.

The MASTER: I understand they decided not to call him, but they could have known that several days ago, it seems to me, and provided for some other witness who must be ready or who should be ready.

Mr. MATHEWSON: He is one of the two engineers who have been examining the plant for a month, as I understand it. I want to be entirely courteous but I could not go on with the cross-examination of this witness at the present stage.

The MASTER: Cannot you get another witness by telephone?

Mr. KIRBY: It is quite impossible.

The MASTER: Mr. Mathewson would undoubtedly consent to suspend this gentleman's examination indefinitely, and then go on with somebody else.

Mr. KIRBY: There is no one else we can put on to-day. We will go on to-morrow and continuously thereafter. Mr. Edgerton
4056 was brought here to-day to endeavor to put in all of this testimony. He has been working on it but he has not made

his calculations. He has been giving his base figures, and it was only late yesterday afternoon that we came to the conclusion that it would be necessary to put him on to-day by reason of our other witnesses not being ready. From that time until early this morning he and I have worked—far into the night and from very early this morning, in an endeavor to have these calculations made, and it was physically impossible to do more than we have done. During recess we endeavored to do what we could, but you can well see it is not two times two makes four—it is far more than that. We can make these calculations now. We can spend the afternoon in doing it, but I think it is taking up all our time unnecessarily, and we could do it in one-tenth of the time if we had quiet and did it in the usual and customary way.

The Master: There is no point in going on simply for the purpose of filling up the time, if the witness is not prepared with his testimony.

Mr. Kirby: That is the position I am taking. I think it is foolish to waste time by adding up, multiplying and dividing and saying that is -he result. We can do if it is necessary, but it is taking all our time and I think it is not bringing forth any good results. We could have this in tabulated form, not only that which we have given this morning but which we would give if we were prepared for it this afternoon, so it will be spread before Mr. Mathewson in a manner which I think will suit his purpose on cross-examination better than the testimony as it is. I am willing to do anything which
4057 suggests itself to either the Master or which would meet with the approval of Mr. Mathewson, but I think it would be a waste of time to go on in this way.

The Master: Well, I do not think that the case is progressing as it should, I am free to say that, and I shall hesitate very much about making any further certificate for time unless the case is run on a little different basis. When Mr. Mathewson was being pressed here to go on with his case he sometimes had two or three witnesses sitting here waiting so as not to waste any time. If you are going to fall by the wayside with the witness you should have had another one here so as not to waste time. I was called back here and came back at considerable personal inconvenience Monday morning, expecting to go on. Nobody did me the courtesy to even telegraph stating you were not going on. I have lost three days. I think the least that might have been done was to telegraph me so I could put in the time on something else. I came here Monday and have been sitting here three days and not accomplished one and one-half hour's work. I think we had better suspend, Mr. Mathewson. I do not see any point in laboring along and having these calculations made here. All of us can use our time to better advantage. Mr. Kirby is undoubtedly right about that.

Mr. Kirby: We can go on to-morrow at half-past nine or ten o'clock.

Mr. Mathewson: Half-past ten is about as early as any of us can get to work, I think. I will go on though to-morrow at 10 o'clock, if the Master desires.

The MASTER: I think it would be better if we could because 4058 I have got to leave early, and I suppose so will you, for a committee meeting to-morrow afternoon.

Mr. MATHEWSON: All right. I will go on at ten o'clock.

At 2:25 P. M. adjourned to November 22, 1906, at 10 o'clock A. M.

Last Exhibits:

Complainant's, 256.
State's, SS.
City's, 63.

4059 Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,
vs.
JULIUS M. MAYER, as Attorney General of the State of New York; WILLIAM TRAVERS JEROME, as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIEN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and THE CITY OF NEW YORK, Defendants.

Before Arthur H. Masten, Special Master.

NEW YORK, THURSDAY, *November* 22, 1906.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Kirby, Mr. Burr.

4060 HENRY H. EDGERTON resumes the stand and further testifies:

Direct-examination continued by Mr. KIRBY:

Q. Since yesterday, have you refigured your cost of pipes, making the correction which you found in your figures of the 4-inch pipe and adding the 1½-inch and 2-inch pipe which you had not included in your first total?

A. Yes, sir. I also included the 5-inch pipe which was not included in it.

Q. And that gives your total for pipe as how much?

A. 4,345,121 feet. This still differs slightly from Mr. Simpson's figures. I find that it does not add up on——

Q. There is an error of a thousand or more feet, yours being the larger figure?

A. I think so; yes, sir.

Q. And what is the total price of that pipe or cost of that pipe as estimated by you?

Mr. MATHEWSON: Can he give the number of tons.

Mr. KIRBY: Yes.

The WITNESS: 104,873.558.

Mr. MATHEWSON: You had 105,018 yesterday without those missing links in.

Mr. Kirby: But he had 20,000 more feet of one than had been given by Mr. Simpson. He stated he had made an error in that, and that, of course, has been deducted, which makes his grand total less than it was yesterday.

Q. What error was it that you corrected which now makes your total less than it was yesterday?

A. I had 20,000 feet too large an amount on the 4-inch pipe.

Q. And you have deducted that?

A. Yes, sir.

4061 Q. Which pipe you have given at the cost figure of about how many dollars?

A. $3,300,430.

Q. As against how much which you gave yesterday before the correction was made?

A. $3,305,038.11.

Q. Have you figured out the total cost of trenching and filling, exclusive of any rock excavation?

A. Yes, sir.

Q. And what is your total figure?

Mr. Mathewson: You mean on the same basis of the unit figure which he assumed elsewhere?

Mr. Kirby: Yes.

A. $663,394.15.

Q. Have you figured out the cost of excavating rock?

A. Yes, sir. Excavating rock on one-tenth the length of mains costs $371,770.

Q. Now will you give us your method of making this computation or of arriving at this cost?

A. I took the total cubic yards of trenching, which was 990,132 cubic yards; one-tenth amounting to 99,132 cubic yards. From this I deducted for the overlying pavement and bedding, one quarter, or 24,780 yards, leaving 74,352 yards of rock, which I have estimated at $5 per yard, bringing the cost to $371,770.

Q. Have you estimated the cost of lead and yarn which would be used in caulking all of the pipe which would be placed in the ground, including the specials and other connections?

A. Lead and yarn I have estimated at $253,825.

Q. Will you give us the computation which you have made to arrive at that total?

A. I took the amount of lead required for the different sized joints, using the maximum figures in all cases of weights for each class of joints, and in that way arrived at the total weight of the lead, which I multiplied——

4062 By Mr. Mathewson:

Q. What did you find the weight to be?

A. 3,912,800 pounds; which I took at five and three quarter cents a pound; the total weight of yarn, 155,000 pounds, at five cents, equals $7,750; and the total of lead and yarn amounted to $230,750, to which I added for the lead and yarn required for specials ten per cent., or $23,075, making altogether $253,825.

Q. How much did that make your lead alone?

A. The value?

Q. Yes?

A. $223,000, plus ten per cent. for specials.

By Mr. **Kirby**:

Q. Have you also calculated the cost of laying, caulking and other incidental expenses having to do with the putting of the pipe in the ground?

A. Yes, sir.

Q. What do you make that to be?

A. That amounts to $261,758.06.

Q. How did you make that computation?

A. I made that computation of the laying, caulking and tool charge on different sizes of pipe by the running foot.

Q. And what prices did you use per running foot for the different sizes of pipes?

A.—

	Inch.	Cents per foot.
	3	3.7
	4	4.
	6	4.3
	8	4.5
	10	5.82
	12	6.47
	16	8.9
	18	10.4
4063	20	12.53
	24	15.21
	30	20.1
	36	29.2

Q. And using those costs per foot, you get a total of laying, etc., of $261,758.06?

A. Yes, sir.

Q. Have you made a computation of the cost of carting away such dirt from the trenches which you consider could not be packed therein after the pipes were placed in the trench?

A. Yes, sir.

Q. What is your total of that cost?

A. I make that 73,000 cubic yards, which I allow for carting $156,000.

Q. How did you arrive at that number of cubic yards?

A. I took the cubic contents of the different sized pipes above 6 inches.

Q. Why did you not take them below 6 inches?

A. I think that the dirt could all be put back in the ditch below that size.

Q. And the cubic contents of the larger sized pipes was figured at a price of removal of how much per cubic yard?
A. It comes to slightly over $2.00 per cubic yard.

By Mr. MATHEWSON:

Q. Cannot you give it to us definitely?
A. Well, it is 73 divided into $156,000. It would be $2.14.

By Mr. KIRBY:

Q. Now, to these costs, did you add any further figures, excluding for the moment the cost of replacing the pavement?
A. I added for supervision, foremen, guarding, and so forth, $127,000.
Q. Did you add anything else?
A. I add also for carting of tools, $45,000.
Q. Now, you have also estimated the cost of replacing such
4064 pavement as would have to be removed?
A. Before that I have added to the total cost, exclusive of the main pipe itself; I have added for contingencies ten per cent., $140,997.72.

By Mr. MATHEWSON:

Q. I do not understand that. Do you mean that includes replacing pavements?
A. Oh, no.
Q. This is before you come to the pavement?
A. Before I get to pavements. This is contingencies, ten per cent. on everything except the cost of pipe.

By Mr. KIRBY:

Q. Now, have you given us all the charges of every kind which you have considered proper in arriving at the total cost of replacing the mains, such as have been testified to by Mr. Simpson, in the manner that you have stated, with the exception of replacing such pavement as would have to be renewed to place the pipes in the ground?
A. Yes, sir. I think that includes everything.
Q. You have computed, have you not, the cost of replacing such pavement?
A. I have.
Q. And what have you assumed as the kind of pavement and the proportions thereof covering the entire system of mains belonging to the Consolidated Gas Company?
A. I have computed for asphalt pavement on 90 per cent. of the length of mains.
Q. Why did you use that figure?
A. I based that on Mr. Simpson's statement that 90 per cent. was laid under asphalt and pavements of equal cost.
Q. In your observations do you consider that a high or a low estimate?

4065 **Mr. Mathewson**: It is simply a matter of mileage. The record shows just how many miles there are of asphalt and new pavement, and it is not a matter of opinion. I should object to the witness's observation.

Mr. Kirby: I do not think we have any direct testimony as to what it is, more than Mr. Simpson's statement as to what he considers it is.

Mr. Mathewson: The witness, Mr. Simpson, has figures from the departments themselves. We keep track, to the foot, of the miles of asphalt pavement.

Mr. Kirby: It has not been offered in evidence.

Mr. Mathewson: It is testified to by Mr. Simpson, to his knowledge. If the witness testifies that it is right in his opinion, if it is wrong he simply convicts himself of error.

Mr. Kirby: Well, he may run that risk.

The **Master**: You may answer.

Exception.

A. I do not think I am posted enough on their mains to say what percentage of it is under asphalt.

Q. You have assumed in your computations 90 per cent.?

A. I have assumed 90 per cent., as stated by Mr. Simpson.

Q. Now, what width of pavement did you use, compared to the size of trench and within which the pipe was to be laid?

A. I added 6 inches on to the width of the trenches, although I didn't see any evidence in such cases as I looked at that any such amount was necessary or used.

Q. In adding 6 inches, do you mean that you assumed that the pavement to be replaced was three inches on each side of the trench greater than the width of the trench itself?

A. Yes, sir; wider than the width of the cut through the asphalt, through the pavement.

4066 Q. And did you assume that the cost of replacing that asphalt was approximately the cost of replacing all other kinds of modern pavements, such as wood block and the like?

A. I assumed that it would cover it all; and it seems to be rather a large figure to cover it on such an amount of work as was here figured on .

Q. What price per square yard did you give for the replacing, as the cost of replacement of all such pavements?

A. $2.75 per square foot.

Q. For other pavement what cost per square yard did you use?

A. For the remaining one-tenth I used 30 cents per square yard.

Q. Using these costs as your basis of calculation, what total did you arrive at as the cost of replacing the asphalt or equivalent pavement, or the cost of replacing the ten per cent, of other pavements?

A. The cost of the asphalt and equivalent pavement was $2,883,664.32; and the cost of replacing ordinary pavement was $34,953.30.

Q. Now, adding these totals to the other costs which you have given, what do you make your estimate of the cost of replacing or reproducing the mains of the Consolidated Gas Company, laid, as you have testified to, and using the units of price which you have given?

A. The grand total amounts to $8,919,792.55.

Q. In your opinion could these mains be purchased, put together and placed in the ground to-day, with all necessary excavations, refilling and repaving, for the figures which you have given?

Mr. **Mathewson**: I object to that, as the witness is incompetent to testify. He has already testified upon certain assumptions that he has made, information from one source or another, and has given the results. Is it competent to permit him to give his opinion 4067 in addition to that, where he has had no experience here or in New York?

The **Master**: I will allow it, Mr. Mathewson, for the reasons already stated.

Exception.

A. In making up this estimate I have used multipliers of the material and labor very considerably larger than I have been used to, in order to meet the difficulties in New York, and I have in many cases doubled up the cost on portions of it, and I have compared it with what I have considered to be accurate statements from other authorities and other towns in the country, and I consider that the figures given would be found in excess of what is required to do that work, rather than deficient.

Q. In your testimony, Mr. Edgerton, you have made reference to the laying in this borough of salt-water mains, the same being placed in the ground in various parts of the borough at this time, and you have given the width of trench which you observed as being used to hold these mains. Did you make any photographs of such works in a manner to indicate the width of such trench?

A. Yes, sir.

Q. Is the series of six photographs which I show you those of this work?

A. Yes, sir; those represent the width of the trenches as I saw them and the photographs show the width comparing it with a yardstick measure. They were taken in various parts of the city where the work is going on; although they have a somewhat similar general appearance, they were all taken in different localities.

Q. I show you this photograph and ask you if you will state where it was taken, if you know; the size of pipe which was placed in that trench, and if you can testify from the photograph what the width of trench was?

4068 Mr. **Mathewson**: Did he see the pipe put in the trench?

Mr. **Kirby**: Yes. If he did not, I did.

Mr. **Mathewson**: Well, you are not on the stand.

A. I saw the sizes being used and the excess of pipe lay along that trench in various places. This photograph represents the laying of a 12-inch salt-water main.

Q. Where?

A. This was on 13th Street; 12th or 13th Street.

Q. That is 12th Street you have.

A. I have a mark on the negatives which shows the exact locations, which I can tell by referring to my memorandum.

Mr. KIRBY: I will testify it is 12th Street, because it is right where I live, and I recognize the house. Proceed.

The WITNESS (continuing): I found as a general thing in laying these mains that the cut in the asphalt is barely two inches wider than the extreme width of the bell of the mains, and therefore on this 12-inch main, with an 18-inch bell, there are 20 inches cut through the asphalt; in some places as much as 22 inches. I do not think the cut would *would* average over 20 inches.

By Mr. MATHEWSON:

Q. That is the 12-inch main, is it?

A. 12-inch main. I endeavored to show in the photograph the irregularities in the roadbed owing to the damage done by traffic, and as we come into the edge of the trench——

By Mr. KIRBY:

Q. Now, you have laid a yardstick across that trench, have you not?

A. Yes, sir.

4069 Q. And does that indicate how wide that trench is at that part?

A. The yardstick is 36 inches long, and by comparison on the photograph with the total length of yardstick it will be readily seen that the width of the trench on——

Q. (Interrupting.) These other three photographs show the same general results, do they not?

A. Yes, sir; only they are taken in different localities; some of them several blocks apart. They all show the same general width of trench.

Q. And were these trenches all for twelve-inch pipe?

A. Those four were all for a twelve-inch pipe.

Q. And these trenches were not more than 22 inches in width, and in most instances 20 inches in width?

A. Yes, sir.

Q. As indicated by the measurements there?

A. Yes, sir.

Mr. KIRBY: I offer these four in evidence.

Mr. MATHEWSON: I object to them as immaterial and irrelevant. They do not show anything; they merely show a ditch temporarily filled, and everybody knows when they come to replace the asphalt pavement they have to trim it off, always do, and that that does not indicate the width of the asphalt that will go into that cover.

The WITNESS: I have allowed for that, three inches on each side.

Mr. KIRBY: The witness has allowed for that. That is the same that Mr. Simpson allowed. This testimony is not in regard to the width of the asphalt, but in regard to the width of the trench, which is materially different from this estimate of Mr. Simpson's for placing his gas mains in the ground.

Objection overruled; exception.

4070 The four photographs are received in evidence, and marked, respectively, State's Exhibits TT, UU, VV and WW.

Q. I show you two other photographs showing the trench. For what sized pipes were these trenches dug, if you know?

A. The pipe in this case is a 24-inch main, 24 inches internal diameter. And one photograph is taken of a straight run of pipe, showing the location of pipe in the ditch and the width of the trench, and the other was taken at a street corner, an intersection, and is made at a point where there is a very deep excavation.

Q. What do you mean by a very deep excavation?

A. An excavation to carry the mains beneath obstructions.

Q. How deep would you mean by that—three or four feet, or five feet?

A. I think this is about ten feet deep.

Q. What is the width of that trench, the one being ten or more feet deep?

A. That trench is 36 inches.

Q. And how deep is the trench in the other photograph, the straight run?

A. That was five feet from the top of the main to the surface of the ground.

Q. What was the width of the trench?

A. Also the same—3 feet in the narrowest part and about 3 feet 6 inches in the widest, showing a cut there. The photograph shows different widths, as the stone pavement underneath projects into the ditch.

Q. And in these trenches was it necessary to use timbers to brace the sides of the ditch?

A. Yes. In such cases it is necessary to use what we call sheath piling.

Mr. Kirby: I offer those two photographs in evidence.

Same objection; same ruling. Exception.

The two photographs are received in evidence, the photograph showing straight run being marked State's Exhibit XX; the

4071 second photograph being marked State's Exhibit YY.

Mr. Kirby: That is all I have to ask Mr. Edgerton.

Cross-examination by Mr. Mathewson:

Q. Is not Mr. W. E. Mackay of Boston the consulting engineer of the Danbury Company at present?

A. He was called in at Danbury to advocate the lowering of price of gas and turned up a few days afterwards and advocated the lowering of the quality correspondingly, just as is done in many cases.

Q. That doesn't quite answer my question. Is Mr. Mackay the consulting engineer for the Danbury Company at present?

A. No, sir.

Q. Do you claim that you still are?

A. Yes, sir.

Q. Consulting engineer of the Danbury Company at present?

A. They consult me in all cases, and have up to the present moment.

Q. But are you the consulting engineer—is that the term used?—for the Danbury Company?

A. There is no consulting engineer, so far as official title is concerned, for a little company like that.

Q. What is the output of that company?

A. 74,000,000 feet, based on ordinary coal gas quality; we calculate the output on the basis of coal gas.

Q. What kind of gas is it that you furnish and make; is it not oil gas?

A. It is water and oil gas of 35 candle power, tested in our fashion, and 44 tested in the usual way.

Q. Oil gas or largely oil gas, delivered through small pipes at great pressure, is it not?

A. No, the pressure is only two inches at the consumer's meter.

Q. That is the maximum pressure at the consumer's meter, two inches?

A. Two inches is the regular pressure in the burning hours; during the day time there are some manufactured—there may be 4072 times when it is slightly greater than two inches. I never saw it to exceed two and one-half inches.

Q. And the charge for that gas is about $5, is it not about, or something like that?

Mr. Kirby: I object. That is not proper cross-examination.

The Master: I will allow it.

Mr. Kirby: Exception.

A. The charge for that gas, the 44 candle, averages $2.70 per thousand.

Q. The maximum charge is $5, isn't it?

A. The maximum price to small consumers is $3.15.

Q. Since what time has it been below $5 for the maximum charge?

A. Fifteen years.

Q. Have you ever laid any pipe in the City of New York?

A. No, sir.

Q. Have you ever employed any labor in laying pipe in this city?

A. No, sir.

Q. What is the largest size of main at Danbury?

A. Ten inch.

Q. And a comparatively small amount of ten-inch, is there not, compared with the entire mileage?

A. About a mile. I understand it does not take but a small pipe to deliver 44 candle power gas.

Q. Did you lay the ten-inch pipes?

A. I think I was there and looked over the laying of that pipe; I don't remember that I took any contract for it.

Q. How deep is the pipe laid in Minneapolis below the top of the pavement?

A. From five to six feet, as an ordinary thing.

Q. Did you read Prof. Bemis' testimony, that he very recently recommended a gas system to the City of Montreal, with pipe laid six feet below the surface?

A. I did not, but I would not advocate any such pipe laying as that anywhere.

Q. If he did so recommend, you think he did not know 4073 his business, do you, so far as that is concerned?

A. I think he has not investigated it as fully as he might on that particular point.

Q. Now, your estimate of the cost of mains in New York City is not based upon the reproduction of the main system as it now exists here to-day with the same depth at which the present pipes are laid, is it?

A. I don't know the average depth of the present pipe; I have seen numerous cases where they were much shallower than this estimate of mine, that is gas pipes; I don't know whether they were the Consolidated gas pipes.

Q. But your pipes were laid under this estimate at an average depth of two feet, you say?

A. Two feet from the surface of the pavement to the top of the pipe, yes, sir.

Q. So that if the pipes of the Consolidated Gas Company average more than two feet deep your figures would not represent the entire cost of reproduction of those pipes, even if your other figures were correct, would they?

A. They would have to be corrected to the average depth so far as trenching is concerned, yes, sir.

Q. What kind of gas is used in Baltimore where you saw the mains exposed?

A. Coke oven gas, coal gas you might call it. It is rather a low candle power coal gas.

Q. Now, what causes the deposits in the holder when gas cools?

A. Well, the cold is what causes the deposits.

Q. And if the same circumstances are observable in the main the same effect follows in the main, does it not?

A. No, not necessarily.

Q. Do you mean to say cold produces a deposit when the gas is in the holder, but does not when the gas is in the main?

A. The deposit in the holder being on gas that is freshly made deposits out all the condensible matter that would be depos- 4074 ited at the given temperature, and there would be nothing left further to deposit in the mains.

Q. Is not something deposited with every additional decrease in temperature, a greater or less amount?

A. Yes, there is a deposit with decrease in temperature, but I had not estimated there would be a decrease in the mains over the holder.

Q. When you say that the public lamps in the City of New York represent exposed services, are you not aware that on cold nights hundreds—a thousand of the lamps freeze up in New York City in the winter, the public lamps?

A. Yes, I suppose they would. It is for that reason I make the main shallower. I say in that case with the shallow mains the deposit is condensed out of the gas and does not collect in the lamp.

Q. So you think the shallower the main the less liability there would be for trouble?

A. I know it.

Q. If there is no deposit in the main, why are drip pans placed?

A. Drips are placed on the mains usually, they are receptacles for water; there is very little, in my experience, of deposit in the mains except water, and a mere skimming of condensation from the gas is the only thing I have ever observed.

Q. Does not pumping those produce oil as well as water?

A. A mere trace.

Q. In your experience, a mere trace?

A. Yes, sir. In one case I gathered it for a whole winter in three miles of mains and did not get half a barrel on the total output.

Q. What kind of gas was that?

A. Water gas of 44 candles, with a larger percentage of condensable hydro-carbons than would be in the case with 22 candles, by far.

Q. Had that gas been previously condensed or compressed?

A. This amount, I think, was taken out by the compression and cold before entering the pressure mains.

4075 Q. Before entering the mains upon which the services are located?

A. Before entering the mains to take it to the neighboring town; my object being to ascertain how much condensable matter could be pressed out of gas by pressure and cold. The pressure in that case was about 45 pounds per square inch, and the experiment was continued during the whole winter, in order to arrive at the amount of condensation, which was almost negligible, based upon the amount of gas sent out.

Q. Would it surprise you to learn that in New York City the records of this company show as high in cold weather as 30 per cent. of oil from the drip in some cases?

A. I should be very much surprised to find any such percentage indeed, because that would represent more than all the light in the gas; there would not be any light left in the gas with such a percentage.

Q. Perhaps we can take care of that, but it would be contrary to the experience upon which you have been testifying to-day if that proved to be the fact, would it not?

A. If 30 per cent. of all the oil used was condensed in the mains?

Q. No, if 30 per cent. of the drip taken out of the pans was oil and 70 per cent. water, instead of a mere trace of oil?

A. That would be a very extraordinary amount of drip, and would show that the machinery was out of order in such cases.

Q. What machinery?

A. The gas producing machinery. The condition of it determines the amount of drip to a considerable extent. If the gas is not properly fixed and the oil is not converted into gas there will be considerable matter left in the gas.

Q. But you will assume that the gas has been in the holder before it got to the mains, and if there had been any such condition as that, would it not have been deposited at that time?

4076 A. Under those circumstances there must have occurred a large deposit in the gas holders, but it would depend entirely in that case how much the total condensation from that drip would be. If it was stated in quantity, 30 per cent. would not be a large quantity of condensation, taken on a small amount of condensation.

Q. Well, in taking these pipes you have assumed that the same proportion of each size of pipe was what you call old pipe, old prior to 1884, and the same proportion of each size was new pipe. You followed that same proportion through each size of pipe; is that right, in your computation?

A. I followed it generally. I did not in each case compute 468/822nds, you may say, but I proportioned it.

Q. Well, with substantial accuracy?

A. Substantially, and at the end, finding I was in excess by 27 miles on the old pipe, I deducted that 27 miles from the old pipe in order to bring it back to the proportion that was stated by Mr. Simpson.

Q. You have no knowledge as to how much was old pipe and how much was new pipe?

A. Nothing further than the statement of Mr. Simpson.

Q. You don't know what the weight of the pipe prior to 1884 as used by the Consolidated Gas Company was, do you?

A. Only from knowledge of the weights of iron founders as practiced at that time.

Q. You do know the weight of the heavier pipe which you have assumed was used since 1884, do you?

A. In my experience in regard to the weights delivered by various pipe founders and in their catalogues.

Q. You have no other knowledge than that?

A. No; I did not weigh their pipes. I do not believe anybody else did, for that matter.

Q. You don't know whether the Consolidated Gas Company has taken what are the standard weights, or whether they have had special pipe manufactured of special weights, do you?

4077 A. No, sir, I do not. They may have a heavier line of pipe than anybody else, but I don't know whether they exceed the heavy weights used in this country.

Q. Now, don't you know, or have not you reason to suppose that substantially all this small pipe from 1½ inches to 5 inches was installed before 1884, or at that time?

A. Naturally, I would not suppose anybody after 1884 would lay 1½-inch pipe and 2-inch pipe and call them mains.

Q. And yet you have included that as half new and half old pipe in the computation, or a proportion of new and a proportion of old, have you not?

A. No, I have not. I have not included those smaller sizes.

Q. None of them?

A. On the contrary, I deducted the 27 miles of dead mains, I deducted entirely from the small sizes of old mains.

Q. Well, for an average of 4 inches?

A. 4 inches and below.

Q. Yes. Well, did that take up all the old pipe from 1 to 5 inches?

A. It was intended to.

Q. Do you know whether or not it did—did you compute to see?

A. I think 27 miles would cover all the small pipe and run into perhaps the 4 inches.

Q. Now, take the heavier mains, the 30-inch and 36-inch mains, those are very much more expensive than the smaller sizes, are they not?

A. In casting, do you mean?

Q. No, I mean in cost per foot?

A. Oh, certainly, a 36-inch main is more expensive than the average.

Q. Now, as a matter of fact, you assumed that nearly half of the 36-inch main had been laid with lighter pipe prior to 1884 in your computation here, did you not?

A. No, not at all. On the contrary, the heavier mains were heavier in 1884 than they are now. That was my computation, and there is none of the heavy mains deduced in this 27 miles. It is all on light mains.

4078 Q. How about the 30-inch main; is it not the presumption that is practically all new as well as the 36-inch main?

A. No, sir. Referring to the inventory of Mr. Allen made in 1884 I notice quite a percentage of large size mains.

Q. Do you remember what percentage?

A. No, I had not time to figure out the percentage, but there is quite a percentage.

Q. You did not know that all the 30-inch mains is new except about four miles and that all the 36-inch mains is new within the last few years?

A. I intended to go through Mr. Allen's computations there but did not have time to do it. I suppose a large percentage of the larger mains is new.

Q. Assuming that a certain portion of this pipe was what you call old pipe in or prior to 1884 and therefore was of a lighter weight as you have stated, you have taken $28.90 per short ton as the value of the iron value of the pipe. Don't you know that several of these subsidiary companies, that is the six companies forming the Consolidated Gas Company, laid the greater part of their mains between 1860 and 1880?

A. As before stated, I have not computed from Mr. Allen's inventory the percentage. I know that a large percentage of it was laid in that way.

Q. Don't you know, as Dr. Marks testified, that during that period pipe brought as high as $70 a ton in some cases in New York City?

A. I don't know whether it was in New York City. I paid $72 to $76 a ton for pipe in the 70's, and that is the reason it was made lighter, I suppose. They were skimping on it.

Q. But you assumed it was at that time of a lighter weight, but you did not take the additional cost per ton into consideration, did you, which you say was the occasion of the lighter weight?

4079 A. I did not consider it necessary to take the price of pipe in the 70's in order to find out what it cost to lay it to-day, no.

Q. You are assuming then that it would cost less to-day to lay it than it would cost to lay it originally, are you not?

A. I don't think there is any assumption upon that. That is plain enough.

Q. It would cost less to lay it to-day than it cost to install it originally, is that right?

A. I say that is right as a general thing, although looking at these estimates of mine and looking back at some old actualities in those days, I find to my surprise that the pipe laid was very little less than it is now.

Q. I know, but I am speaking as a general proposition. I understand your reply is as a general proposition, and not picking out a specific case.

A. Yes. Pipe at $76 per ton is certainly more expensive than pipe at $28.90.

Q. And the cost of that pipe in the ground originally, the cost of laying it, would represent a total cost greater than the cost of reproduction to-day of the same pipe in the ground, would it not?

A. As before stated, I saw the actual figures of the cost of laying the Mutual pipes, and it differed very little from what it is to-day.

Q. You don't know when the Mutual pipe was laid, do you?

A. Yes, exactly.

Q. Was not the Mutual organized about 1830?

A. No, sir, in 1872 or from 1870 to 1872 the Mutual was built.

Q. Do you mean to say that the Mutual Gas Light Company was not incorporated until 1872.

A. I don't know about the date of incorporation; I am speaking of the building of the works. I was in New York City during the construction of the Mutual works and starting of it, and was consulted about it, so I have reason to remember that.

4080 Q. Now, in computing the length of pipe, do you allow 4 inches for the hub or any other length, or do you assume the pipe to be placed end to end in your computations?

A. Well, my computation is based on the actual length of pipe, whether it is 12 feet length laid or whether 12 feet 4 inches, it does not make any essential difference.

Q. Don't you understand that the figures of the mileage given by the company, 822 miles, for instance, includes the length as the pipes are laid in the ground and therefore duplicates the pipe for each joint?

A. It duplicates the amount that the socket goes in, but that is allowed for in the computation.

Q. Well, how much is that for each joint?

A. It is the weight of 4 inches or whatever the bell covers.

Q. Did you allow for that in addition to the actual mileage in your computation of values here?

A. Yes, sir.

Q. How much do you allow for specials per pound?

A. I allow a little over double the cost for specials over the cost of pipes. The 10 per cent. allowance made for specials would allow of their costing somewhat over double the cost of mains per pound.

Q. How much per pound-

A. It would be 3¾ to 4 cents per pound.

Q. Where delivered-

A. In New York.

Q. Is your computation for pipe delivered alongside the trench or on the dock?

A. At the ditch, and cartage included.

Q. Are not the rates per ton usually computed on the dock and not alongside?

A. They are when you don't know what the destination is, but in—— -

Q. Well, aren't they anyway in New York City?

A. As a general thing a bid on pipe would be, and it would be specified.

Q. How much did you allow for transportation from the dock to the trench?

A. I included that in the cost of the pipe.

4081 Q. Did not you separate the two at all in your computation or in your mind, the cost at the dock plus the cost to deliver alongside, making the total $28.90?

A. No, for the reason that when once pipe is delivered, whether the destination is at the yard or whether in the street, the difference would be comparatively trifling.

Q. How would that be if it came by water, is not the cost consirerably more to deliver it alongside the ditch, than it is delivered on board at the dock in New York City?

A. I estimated to include the cartage to the ditch.

Q. How much did you allow for cartage from the dock to the ditch?

A. I have not the exact figure here. I can get that for you. I estimated the pipe intending that the pipe would be included along the ditch, in an estimate of this kind.

Q. I understand, but don't you know that pipe is as a rule delivered in New York City at the dock and that we have got to reckon with that, and that the boats which bring the pipes cannot deliver it at the ditch?

A. Certainly.

Q. Won't you tell me how much you would allow for the cartage from the dock to the ditch, so I can see what the $28.90 would represent at the dock?

A. I cannot give you that figure just now; I have included it in, however.

Q. Did you actually make a separation and figure it out?

A. I have separated it as nearly as I can.

Q. Can you not remember what the basis of your computation was?

A. No, I do not. I calculated a short ton instead of a long ton on the computation, and that together with the cartage gave me this figure.

Q. You cannot tell how much the cartage was now?

A. No, I can figure it out. I took into consideration the fact that
I had reduced also the price per ton from the long ton to a
4082 short ton of 2,000 pounds, and that made some difference in
the cost of the pipe naturally.

Q. Oh, of course. Now, do you take into consideration the fact that when pipe is ordered it is often necessary to transport it from the dock to the yard and store it, or portions of it, pending use or the opening of a ditch and then load it and recart it to the ditch?

A. In making pipe-laying contracts I have often made with the contractor the provision that he would lay it alongside of the ditch and——

Q. But you know in the City of New York that the ordinances forbid of the opening of more than a certain length of ditch at the same time, so you would not lay your pipe alongside until the ditch is ready?

A. That is the case everywhere, you cannot string it all over the city.

Q. Did you make any allowance then for double cartage of the pipe or some part of it first to the yard and then from the yard to the ditch later?

A. I don't think it involved any double cartage. I do not think it is necessary to make any allowance for double cartage.

Q. You think you can allow pipe to remain on the dock until it is used and then have a single transportation to the ditch, do you, as a general thing, in the City of New York?

A. I think an arrangement could be made in a contract of that size for storage of the pipe, certainly.

Q. Well, if an arrangement was made, that would involve some payment for the use of the dock for that stor-ge purpose?

A. Yes, that is a figure I am not acquainted with, and I supposed that the difference between the long ton and short ton certainly ought to cover such a charge as that.

Q. The difference between the long and short ton may cover a
multitude of sins, but the question is whether in your compu-
4083 tation you intended that to offset these other considerations to
which I am referring?

A. I intended it to cover it, certainly. I would not knock off 240 pounds to the ton without some consideration for it.

Q. Did you not consider that the short ton was worth $28.90?

A. No, I did not, by any means, for the long ton as quoted by Mr. Simpson was $28.90.

Q. But pipe to-day in the City of New York is worth more than $28.90, is it not?

A. Certainly. Just at the end of the year when everybody is hustling to get their jobs done and have delayed, there is a temporary rise in pipe, almost always, and in the fall, and I should not think of asking prices on a large quantity of pipe at the season when everybody was pressing for pipe.

Q. Don't you know that pipe was higher in January, 1906, than it was in October, 1905, or don't you?

A. That must be an exceptional case, when it happened that way.

Q. Now, don't you know that pipe was higher in July last than it was in January last?

A. I am stating the general course of pipes, that it will rise towards the active time in the fall when belated people are engaged in rushing in their mains.

Q. I am asking you this question. Mr. Simpson has testified and you have seen it if you have read his testimony, that it was higher in January, 1906, than it was in October, 1905. Didn't you know that to be the fact?

A. I don't remember his testimony in that respect.

Q. Do you know that to be the fact?

A. State your question again.

Q. That pipe was higher in the first part of 1906, say, January, than it was in October, 1905, which was in the fall?

A. I know that this year there has been a rise in the price of pipe to some extent.

4084 Q. Don't you know that pipe was higher in July, 1906, than even it was in January, 1906?

A. Oh, there is an attempted corner in pipe.

Q. Just answer my question, won't you? I don't know anything about corners, I am talking about what we have to pay for pipe. Read the question.

(Previous question read).

A. All I know in regard to that is that a number of people were holding off from laying pipe on account of the higher prices.

Q. Well, will you answer the question now?

(Question repeated.)

A. That is the only way I knew it, was by people ceasing to——

Q. I do not ask you the way you knew it. Don't you know it, Mr. Edgerton?

A. I did not ask the quotations at that time, no, sir.

Q. Then you do not know it, is that so?

A. I know it from the way I have stated, that I inquired why people were not laying certain pipes and they told me there had been a rise.

Q. How long since you have been in the market as a purchaser for pipe?

A. I have not bought any pipe since 1904, I think it was.

Q. Was that for Asheville?

A. That was for Asheville.

Q. How about the cost of trenching and refilling, do you know what the charge for labor is per day in the City of New York of that character?

A. I have estimated $1.75 for ordinary labor.

Q. For how many hour's work?

A. Ten hours.

Q. You do not know whether the eight hour or ten hour day prevails in New York?

A. I do not know to what extent they draw the difference or line between eight and ten hour work, but the higher priced work I suppose is eight hours and laboring men are on a ten hour basis.

4085 Q. Do you know whether there is any difference in the number of hours work under the city contracts, such as the laying of the salt water mains and the contracts of other corporations?

A. No, I have not the data in regard to salt water mains further than ascertaining how it was done.

Q. How wide a trench did you say a three-inch main would require?

A. I think it was one foot—1.833, which is equivalent to 22 inches, I think.

Q. You have assumed 67 cents a yard as the cost of excavating these trenches. Do you know what the company is actually paying per yard?

Mr. Kirby: Sixty-seven cents for dirt?

Mr. Mathewson: Yes, for dirt.

Q. Do you know what the Consolidated Gas Company is actually paying under contract for the removal of dirt in the City of New York?

A. Digging out of the trench, do you mean or removing it——

Q. Yes, excavating it.

A. I do not. I only know——

Q. You have never made any contracts for the excavation of dirt in the City of New York, have you, under our regulations?

A. No.

Q. Do you know what the City pays per cubic yard for the excavation of dirt for these salt water mains to which you refer?

A. I know, being very much deeper, they probably pay more.

Q. Don't you know what they are paying?

A. No.

Q. Has it not been brought to you that they are paying a dollar a yard instead of 67 cents?

A. Well, I think a dollar and 67 cents would agree very well on the different depths of trench.

Q. You think on account of the greater depth a dollar would be equivalent to 67 cents for what depth of trench?

A. My depths probably do not average half the depth, perhaps not one-third of the depth of the salt water mains.

4086 Q. Well, you are assuming a depth of two feet below the top of the pavement for the top of the pipe, are you not?

A. Yes. I saw their pipes buried five feet to the top of the pipe, and I should say on a great deal of that excavation $1.00 for that would be as cheap as 67 cents would be for handling it two feet. You might in many cases have to rehandle it.

Q. Did you see many cases in which they did have to rehandle it?

A. I saw——

Q. Did you see many cases where the dirt could not be thrown up to the top of the trench to the place where the workman was standing?

A. Yes.

Q. Was it a large proportion of that mileage that you saw?

A. It was mostly at street intersections. I know a man could not stand in a trench when the water main was 5 feet below the surface and there was 2½ feet more added and throw it very conveniently to the top. I don't think he could.

Q. What standard authorities did you consult as to the cost of labor in New York City?

A. I asked the cost of ordinary labor in New York City and I understand it was $1.75 for common labor, ditching.

Q. Now, you have allowed how much for the width of trench on each side of the diameter of the pipe so far as the Gas Company is concerned?

A. I say I have allowed more than I found to be the case——

Q. Well, how much have you allowed?

A. I think it would fairly average 4 inches bigger than the bell of the pipe.

Q. Two inches on each side?

A. Yes.

Q. Don't you know that the City's specifications allow 1 foot on each side of the pipe in all trench work; for example, for a 24-inch pipe a 4-foot trench?

A. They might allow it but they do not do it. I don't know what——

Q. Don't you know that they do allow it?

4087 A. I have only informed myself as to actualities. I don't know what the ordinances may be, no, sir.

Q. Don't you know that it is required to tamp down under all gas mains laid, and that that tamping can only be done inside the ditch?

A. Well, we always settle the dirt very firmly in a gas trench, sometimes by tamping and sometimes by water.

Q. You have got to have width enough of trench so you can do your tamping under the main, havn't you?

A. Not necessarily, I prefer to use water.

Q. Do you know in New York City they do not allow the use of water in place of tamping, or do not you know that?

A. I never knew of a place where they did not allow water for settling.

Q. Well, they do not in New York, and I want to ask you if you did not know it?

A. On the contrary, I was informed that they did allow it and was done.

Q. Your information is that private contractors like the Consolidated Gas Company can use water instead of tamping, is that right, in their trenching?

A. Yes, I think that water is the best way to settle dirt in a trench. It may cost more than tamping, but it is certainly the best way of doing it.

Q. Well, if you do it by tamping you must have your ditch wider than if you use water, must you not?

A. No, I do not think so. If you have got your ditch 4 inches wider than the bell of the pipe, I do not see what is to prevent tamping around the side of the pipe especially in a shallow depth.

Q. What about the slant of your tamping bar, must you not be able to get that in at an angle in order to do the tamping?

A. There is room enough at that depth of ditch to tamp underneath the pipe withe perfect ease.

Q. And with two inches on each side of the pipe?

4088 A. That is the bell. The bell is a good deal larger than the pipe.

Q. Do you have to do any tamping under the bell?

A. Well, the tamping under the bell would be infinitesimal, in fact the rim of the bell extends a distance of about an inch and a half where it is of its largest diameter.

Q. Did you know that in this city the City compels everything to be taken out of its way, all pipes, when it has any work to do in the street, any pipes to lay?

A. Naturally, I suppose that they require obstructions to be removed from necessary work.

Q. At the expense of the company having the pipes there, of course?

A. I do not see that that applies to a new work.

Q. Did you know that in crossing nearly all the avenues with a gas main of 24 inches or 30 inches in diameter it is necessary to go down in almost every instance from ten to twenty feet, or did not you know that?

A. No, I saw plenty of room to go above everything I have seen in laying pipes——

Q. If you were above the pipes running lengthwise of an avenue and placed your pipes on those pipes how near the surface would the 24 or 30-inch main come, do you think?

A. I do not understand that in running pipe parallel with the other you lay them on top.

Q. I am talking about laying mains across an avenue, where there are already pipes, and I asked you if you did not know it was necessary in almost every instance in laying 24 to 30-inch main to go from ten to twenty feet deep in order to get the pipe below the pipe and other obstructions in the street?

A. No, I do not think that would be the case at all.

Q. You did not take that into consideration in your computation of cost?

4089 A. I took into consideration in looking at those intersections at the crossings of the streets, of which there are a number open, that there was no room to put ordinary-sized pipe there.

Q. How many miles of the 822 miles of mains in New York City do you think you have personally inspected through openings of the earth?

A. During the construction of the subway and visits to New York during a period of 40 years I have seen a great deal of it. But I have not seen all of it by any means, and I do not think any other man has.

Q. I will ask you if you knew that in almost every instance in laying a twenty-four to thirty-inch main across an avenue in New York City you have to go from 10 to 20 feet deep in order to do that?

A. No, I will say you would strike the sewers in such cases as that.

Q. Don't you know that the company often has to go under the sewers in laying these pipes across avenues?

A. No, I do not know. I never knew of a case that had to go underneath sewers to lay pipes.

Q. You did not make any allowance for such expensive excavation as that, did you in your estimate of cost?

A. Never. I do not think anybody would allow an estimate for running gas pipes beneath sewers. I would not——

Q. You did not make any allowance for such things as that, did you, as a matter of fact, Mr. Edgerton?

A. No, sir, I never would, nor anyone else.

Q. Well, you did not. Just answer my question.

A. I never estimated a gas pipe going underneath a street sewer, no, sir.

Q. And you did not make any estimate for the necessity of laying your pipes 10 to 20 feet deep in crossing avenues with 24 to 30-inch pipes?

A. No, sir, and I do not think it is——

4090 Mr. Mathewson: I move to strike out the last part of the answer.

The Master: Strike out after all "no."

Q. You said that these salt water mains, some of them had to go down 10 feet, didn't you?

A. I saw a salt water main at the deepest point at the intersection of—there is the salt water main at the intersection of Seventh Avenue and Thirteenth Street (handing photograph). The excavation may have been in that case 10 feet to the bottom of the pipe.

Q. Yes, you did say it was necessary to excavate 10 feet deep, did you not, or that you found a ditch 10 feet deep?

A. I found a ditch 10 feet deep in that particular case.

Q. That is my question. Did you know it cost as much as $100 a foot to cross Avenue C at 12th Street, with a 36-inch main?

A. No, sir, I did not.

Q. Did you know that it cost $40 a foot to cross Sixth Avenue at Fourth Street with a 30-inch main?

A. No, sir.

Q. Do you know what the rules of the Department of Public Works in the City of New York are as regards excavating and back filling and the character of the back fill which must be used?

A. I only know from what I see in their throwing dirt back in the ditch, I did not see that there was any more done in it than I always had been used to doing.

Q. Do you know what the regulations are?

A. No, I do not. I have not read their regulations.

Q. Do you know that the rule is if we take out rock we are not allowed to put back any stones larger than 4 inches, but have to refill with new clean soil, did you know that?

A. No, sir; I estimated that the stones are saleable if they are of any size.

4091 Q. Are not the blasting risks and the care necessary in blasting where you were excavating rock much greater in a city like New York than they are in a small town?

A. The small amount of rock that I have estimated on, I think the 10 per cent. contingency would cover that.

Q. Did you take into consideration in your estimates the great amount of sub-surface structures which must be dealt with in laying gas mains in the City of New York?

A. I did to the extent of laying mains to the depth I have estimated. I did not——

Q. Did you know that in constructing the Rapid Transit Subway at 42nd Street between Park Avenue and Broadway and north of Broadway to 46th Street, a distance of not more than 2,700 feet, the estimate for replacing sub-surface structures such as gas mains, etc., was about $245,000, or did not you know that?

A. I estimated any removal of gas mains by contractors would have to be at their own expense. I am not moving mains, I am only placing them in position and I am not taking care of them afterwards in this estimate.

Q. Did you know that the sub-surface structures in Avenue C were such that it took the company about three months to put its main across Avenue C, including the shoring up of other pipes and excavations and taking care of water which leaked in, etc.? Did you know there were any such difficulties as that to be encountered?

A. I understand on these shallow pipes I did not take into consideration any difficulties further than I saw would be necessary to bury pipes at that distance, which is above the usual obstructions.

Q. Did you know that the surface structures are so large and expensive that it sometimes takes the company weeks to get its main around a single corner on account of caring for other sub-surface structures and the obstructions due to them?

4092 A. From what I have seen of the main laying, I did not see any difficulty about handling them any further than is ordinary in large cities.

Q. You did not know these things, did you, to which I have called your attention, if they be facts, and you did not allow for them?

A. I only allow for what I have seen, and I have seen a good deal of piping.

Q. You know in laying these salt water mains the city has everything removed out of its way, so that their work is comparatively simple, don't you?

A. It looked to me as simple as any work of the kind I was acquainted with. I did not see any trouble about it.

Q. You did not know it was costing the Consolidated Gas Company at the rate of $1,000 a week to get their mains out of the way for these salt water mains, did you?

A. My estimation does not include taking care of the mains after they are laid. It is simply getting them down.

Q. You spoke in reference to the depth of the excavation as though that had to do with the candle-power alone. Are there not other elements that require mains to be placed a certain distance underground except the cold which may affect candle-power?

A. They have got to be put low enough to be safe in respect of breakage or——

Q. Don't you know with the modern pavement in New York City, some of it is 18 inches deep itself, which would leave only 6 inches below the bottom of the pavement and the pipe?

A. Well, I do not see any harm in that.

Q. You do not know that it is often the practice to excavate to the depth of 18 inches before the new pavement and then roll the street with a heavy steam roller preparatory to putting in the pavement?

A. That is very usual. The depth is a little excessive, but I have seen a 12-inch bed and probably 14-inch bed laid for paving.

4093 Q. We will assume there is a depth of 18 inches, and that would leave only 6 inches from the top of the pipe if it were placed only 2 feet deep. Don't you know with only 2 feet of covering and with the heavy steam rollers they use in New York, that would certainly result in an injury to the pipe if there was only a covering of 6 inches?

A. They fill in before they roll.

Q. You don't know then that they often cut down to a depth of about 18 inches and then roll the street preparatory to putting in their pavement and foundation, do you? That had not come before you, had it?

A. Preliminary rolling, no. I do not think it is necessary.

Q. You do know that a covering of only 6 inches above the pipe with heavy steam rollers would almost certainly do injury to the pipes, don't you?

A. No, I do not think it would.

Q. You do not think it would?

A. No, sir.

Q. What about the services? Services are arranged to come out of the top of the pipe, aren't they?

A. Sometimes, and sometimes out of the side.

Q. Is it not better policy to have them come out of the top of the pipe than out of the side?

A. If the pipe is deep enough you can take them out of the top, otherwise at the side.

Q. Do you mean to say that 6 inches would be sufficient depth to take the services out of the t[illegible] of the main and at the same time leave sufficient support for a heavy roller?

A. No more than I should say 90 per cent. of all the services are taken from the side of the main. When the pipe is sufficiently deep they are taken from the top.

Q. Have not you read——

A. When the pipe is shallow they are taken from the side of the main. It is a matter of indifference, the gas will come out in either case.

Q. Have not you read in the Gaslight Journal, if you have
4094 kept up with the literature, that mains have been broken
even two feet below the surface by the heavy steam rollers
which are used now in rolling the streets, in England?

A. There may be occasionally such cases.

Q. You have read of such cases, haven't you?

A. Very rarely.

Q. Now, take this consideration, where in the streets of a city like New York, there is much heavy traffic and much congestion of traffic, you must make more allowance, must you not, than in a smaller place where there is less congestion and less heavy traffic?

A. I do not see any reason for allowing more than they allow in the old country. It is one foot nine there and here I have allowed two feet.

Q. One foot nine below the bottom of the pavement?

A. Below the top of the pavement to the top of the pipe.

Q. What old country is it where they allow only that difference?

A. In England.

Q. What cities?

A. Newbigging gives it as an average.

Q. Don't you know that is all changed now, and that if Mr. Newbigging's suggestion was ever correct, it does not apply at the present time?

A. No, I do not.

Q. Taking now these other pipes in a street, you have observed, have you not, that many other pipes run parallel with the gas mains, as the street is uncovered?

A. Parallel and generally underneath, the water mains lying at a lower level.

Q. They are at a considerably lower level, are they not?

A. Than the gas mains, yes, sir.

Q. And then you noticed that many pipes run side by side with the gas mains and on the same level?

A. I have noticed numbers of gas mains in these subway excava-
tions suspended, yes, sir; and looking in the subway excava-
4095 tion at the time that was going on, we saw them suspended,
and we see them suspended now by iron chains, and I question
whether the majority of those pipes are not shallower than three
feet, those that I saw. I have seen them placed where they were
not two feet.

Q. Well, we have exact figures, so we know and do not have to guess; but have you not observed these other pipes running parallel and on the same horizontal level with the gas pipes?

A. Yes, sir, I have seen those to be duplicated gas pipes.

Q. Outside of gas pipes?

A. No, I don't remember other pipes running parallel outside of gas pipes. I took all those at the higher level to be gas pipes.

Q. If the Consolidated Gas Company has certain gas pipes and there are other gas pipes in the same street and parallel, would you not think that it would be wiser to place the Consolidated Gas Company pipes on the same level as the other gas pipes so that they might not be undermined and sag when the other gas companies want to repair their pipes?

A. Yes, sir; I should place the pipes on the same general level, only that I should place pipes higher than at the height that I have estimated.

Q. Yes, but if you found the other pipes there at the lower level, you would place your pipes on the same level, would you not, if it was not very much lower?

A. No, I should run over the old pipes.

Q. Do you mean you would put your pipe directly over the old gas pipe, lay it on it?

A. No, not lay it on it; you only have to take that into account at intersections. At other than intersections the pipes run parallel.

Q. Do you not know that the yokes and ducts of the trolley companies here, which operate on pretty nearly all the avenues and many of the streets, are at least two feet six inches deep to begin with, and we have to go under the yokes; or didn't you know that?

A. The trolley ducts are in the middle of the street and
4096 the gas mains are usually on the sides of the streets.

Q. But we have to run our pipes across the streets, do we not, across the avenues?

A. In that case you would have to go below, certainly.

Q. You know that the specifications in reference to these salt water mains provide that unless otherwise ordered by the engineer all pipes shall be so laid that the top of the inside of the barrels will be five feet below the grade of the street?

A. That is a provision for salt water main laying, and salt water mains and gas mains are different mains.

Q. Is not that so as to all water pipes, and not salt water pipes alone?

A. Yes, water pipes have to be laid below frost because the water is sometimes stagnant, and it would freeze and burst the pipes if laid above the frost line.

Q. Don't you know that it is further provided in the specifications I have referred to that the trench shall be excavated 2 feet wider than the interior diameter of the pipe and 6 inches deeper than the inner bottom of the pipe?

A. I know they are not doing it.

Q. Won't you answer the question, Mr. Edgerton?

A. No, I do not know those regulations, no sir. Only what I saw.

Q. You cannot imagine, can you, why the City, which has to pay for excavation, should insist in its specifications, that the trench should be excavated 2 feet wider than the interior diameter of the pipe, unless they saw some advantage in a wide trench, and what could the advantage be if not that the pipes would be thoroughly tamped down and otherwise properly treated?

A. I don't know what becomes of that margin, no, sir, between what they say and what they do.

Q. What proportion of the mileage of these salt water mains
4097 have you actually gone over and seen the trench wide open?

A. Well, certainly not a very large mileage. I have gone
over all looking wherever I saw work in progress, and wherever

I saw work that had been finished up, and the blocks put back, I took note of it. I made measurements in many cases besides those mentioned, but those are typical of the whole. It was not any very large percentage.

Q. Now, I understand that the weights which you have given for old and new pipes are simply weights which you have assumed and they are not based on any knowledge of the weights of the pipes which the Consolidated Gas Company actually had in the ground; is that right?

A. They are taken from my experience and from catalogues from these founders, those engaged in the manufacture of pipe at different periods.

Q. And if those weights are less than the pipes of the Consolidated Gas Company actually in the ground and you were to reproduce the Consolidated system as it now is, that would add to the figures given in your estimate, would it not?

A. It would add if they were heavier. I do not see how they can be heavier within any bounds of reason.

Q. Well, we do, and they are heavier, so we do not need to argue that. I am merely asking you questions. Is there any inspection by the city authorities of Danbury which you have to pay in connection with the laying of mains, city inspection?

A. There is city inspection. I don't know as there is any extra charge for it. We have to get permits.

Q. Did you make any allowance for city inspection in the case of laying these mains?

A. Yes; I figured that in here.

Q. In what, in the ten per cent. extra for contingencies?

A. Supervision, foremen and guarding, and contingencies, yes.

4098 Q. Do you now how much the city inspection costs the company?

A. I made inquiries in regard to the number of inspectors required and their compensation.

Q. What did you find their compensation was and how many of them we had to employ?

A. I have forgotten. I have a memorandum somewhere in regard to it. I think it was $1,200 a year, or something of that sort.

Q. Do you remember how many inspectors?

A. I don't remember, but they were portioned out among the companies.

Q. Did you compute how many cents per foot pipe laying costs for city inspection?

A. I did not separate that item because I saw it would not figure very largely, to have to pay the salaries of inspectors.

Q. Have you ever had any experience recently in laying in large cities where city inspection is required and where there are asphalt and modern pavements?

A. I had a tremendous amounting of inspection and fussing around at Asheville.

Q. Well, that is not a very large place, is it?

A. No, but they made a great fuss about it.

Q. Asheville is not a large city according to your view, is it?

A. No, but the pavement was a great object to preserve. It is a sort of resort, and they take great pride in their pavements, and were very exacting in regard to replacing them and cutting through them.

Q. You would hardly compare Asheville with the City of New York, would you, in the congestion of traffic and rock and city inspection and other details taken as a whole, and the size of main, would you?

A. Not in regard to the size of main, but in regard to the rigidity with which they looked after things, I thought they were severer than any place I knew of. They took——

4099 Q. You don't know what you had to pay for city inspection, do you, if you had to pay anything?

A. Well, it was not a large sum, but it made a great deal of trouble.

Q. Now you stated among other things that you laid mains shallow, as I understood it, because the gas was fixed, water gas was more fixed or permanent than coal gas. Was not that condition prevailing, so far as it did prevail, when the Pennsylvania oil was obtainable in quantity and at prices which could be afforded in gas making?

A. All properly manufactured oil and water gas is very fixed in regard to——

Q. Do you mean to say that the water gas as made from the oil now commercially obtainable and useable in gas making is of the same fixity, so to speak, as the gas which was made from the Pennsylvania oil?

A. I think so.

Q. And do you think now that the water gas now that is made from the present oils shows a greater fixity than coal gas of good quality?

A. Yes, sir; properly made. I notice the percentage of tars in some of the gases in condensation looked to me extraordinarily large, and I could not account for it at all except that the gas machinery was deficient in capacity to convert the gas. I have figures in that respect which probably will come up.

Q. Don't you know as a matter of fact that the oil now in use in gas making is so inferior in respect to fixity that in winter, to meet the condition of lower temperature, a substantially greater quantity of oil has to be used to compensate for the drop of candle power?

A. No, sir. Gas properly made now is just as fixed as it ever was.

Q. Are you making any water gas now at all except this water and oil gas at Danbury at which place you say you are manager?

A. I did not say I was manager.

4100 Q. I thought you said you were manager the other day?

A. No.

Q. Well, are you manager at Danbury?

A. No, I am not manager. I am consulted in regard to it because I put up the works.

Q. You are not managing any plant then which is producing water or oil gas, are you?

A. No, I refused to take the management of the works, for I was engaged in other works, and I am not managing the works. I have been offered a position as manager of the works.

Q. How many years is it since you have been actually in management personally of a water gas works?

A. I have been building all the time, I have not been managing only in cases where the works were starting up.

Q. Yes, I am eliminating that. I mean in actual and continuous management, where you have been in actual management of works, how many years is it since you have been in actual management of a water gas works?

A. I have not been manager in any case. I have built the works and run them to start the works and then overlooked them from time to time to see how they were getting on.

Q. So that your work has been rather in constructing and testing than in actual operation of works?

A. Interspersed sometimes with the actual operation of works, so long as it was a question of getting them started.

Q. Precisely, testing them, so to speak.

A. Sometimes the testing lasted for a long time. In the case of New Orleans it lasted for six or seven months.

Q. Do you know how long New Orleans was operated with your plant before your plant was discontinued in use wholly or practically?

A. Well, that is simply part of the plant, part of the operations. I think we ran about two years on the vertical retorts. There were then about forty different people log rolling for different ways of making gas which they sought to introduce in part as a sample there. 4101

Q. You have not been the actual operator and manager of a gas works except in connection with testing them and putting them in condition after construction, for a great many years, have you, Mr. Edgerton?

A. No, I do not operate works, I put them in order, but that includes the operation until they are in order and working satisfactorily.

Q. Now you referred to the cost of lead or the amount which you allow for the cost of lead as $223,000. And you took lead at 5¾ cents per pound. Is not lead 6 cents per pound now instead of 5¾ cents?

A. No, sir.

Q. Where do you get your authority for the statement that lead is 5¾ cents a pound now?

A. I telephoned yesterday to a large operator in lead, handling lead, and he gave me that price.

Q. Who was he?

A. I can get the name. I have forgotten. Phelps-Dodge & Company referred me to these parties, and said they were not handling lead any more, and they referred me to a party who made a specialty of handling lead, and they gave me that figure as the trust price of lead and the street price they said was larger, but that was, as he called it, the trust price.

Q. Well, what was the street price? We have not anything to do with trusts?

A. I don't know why that trust price was quoted lower than the selling price. I suppose it was a mere question of difference between retail and wholesale price.

The MASTER: What was the street price, he asked you?

The WITNESS: I think it was 6¼ or something like that.

4102 Q. Well, that is what is known as spot lead, is it not, the street price?

A. All I know, he offered to sell lead at 5¾ cents.

Q. Don't you know what the meaning of spot lead is, the quotation?

A. I know spot cotton or spot lead or spot anything means on the spot, in handling the actual stuff. But I took it as a large dealer in lead offering that price.

Q. Well, you know the trust only sells in carload lots, don't you?

A. This would be a great many carloads.

Q. Or didn't you know that?

A. This would be a great many carloads.

Q. Oh, yes, and it would take a great many years if you were going to lay down the system of mains in New York City, all at one time, wouldn't it?

A. It would take a number of years, of course.

Q. You don't suppose that the system of mains in New York City ever was or ever could be laid down as a wholesale proposition?

A. No. It could be laid serially, of course, but it would take time.

Q. We are talking of practical things and not of Utopian. Now, let us take the weight of lead. How much weight of lead did you allow for each size joint?

A. As before stated, I took the heaviest. I see I have the results here in total, weights of lead, and the multipliers I have not got down on this paper but they correspond——

Q. You haven't the weight that you used for each joint?

A. I have it somewhere. I haven't it down on that list; but I used substantially the weights,the higher range weights as recommended in here by the Gaslight Association. With the exception of the larger pipes where I used a little heavier weights.

Q. What are you reading from?

A. This is weights given by the American Gas Institute, 1906.

Q. You mean at page 14?

4103 A. Page 14, where it says, "Weights in pounds, from and to." I adopted generally the larger weights and increased some of those on the heavier sized pipes.

Q. What depth of lead did you use on the joint?

A. Well, that varies slightly; it runs all the way from 1⅜ inch to 2½, somewhere along there.

Q. What did you use in your estimate?

A. The depth did not enter into it, because the weight of lead was what I was arriving at. The joints will vary slightly in thickness, some being a little lighter or heavier than the other, this being an average figure.

Q. Did you allow anything for waste of lead which occurs in caulking joints?

A. The waste is very slight, but I should include that in the ten per cent. I have allowed. All the gates—what we call gates, in pouring the lead, are cut off carefully and the surplus lead trimmed off, or if any runs into the ditch through breakage of the——

Q. Do you mean to say you consider it feasible to lay mains of any considerable size by first caulking them together and then lowering them into a ditch?

A. Not any considerable size. I spoke of the smaller sizes, 3-inch, 4-inch, and two joints of six.

Q. If you have the pipe so near the surface of the ground that it heats or cools with changes of temperature, does it not result in expansion and contraction of the pipe?

A. Slight.

Q. Doesn't that have a tendency to weaken the joints and produce leakage?

A. No, sir.

Q. Not at all?

A. Not at all. You have got just as tight a pipe with a shallow depth as you have at the larger depth.

Q. But the greater the change in temperature where the pipe is the greater the contraction and expansion, is that not so?

A. That is taken up on each joint.

Q. Well, isn't it so?

A. Yes.

4104 Q. And the greater the depth the less the change in temperature?

A. Yes. You could go down where there was no change.

Q. Do you mean to say that expansion and contraction have no effect whatever upon the joints of the pipes and have no tendency to produce leakage?

A. Not a particle. I have had the pipe in the open air and watched it for years. It is foolish to talk about expansion and contraction after the experience we have had with pipes, in that respect.

Q. In reference to the laying and caulking of pipes, do you know what labor is worth for laying pipes; what the wage is per man?

A. I thought I assumed it pretty high. I took caulkers at five dollars a day. I was told that was too high, and I suppose it is.

Q. What did you take for the workmen who are laying the pipe?

A. Well, except the men yarning and rolling into the trench, the caulkers are the ones who lay the pipes. They have the chief business of the laying, except the foreman. Yarning is comparatively simple work, caulking is the next, and, of course, the foreman's, on top of that, is most expensive.

Q. Well, what wages did you allow in this case. You said five dollars for the caulker. How much for the yarn man?

A. Two dollars and fifty cents; and I allowed $1.75 for the common laborers. A foreman at five dollars, the same as the caulker.

Q. What proportion of caulkers and laborers would you have?

A. Well, that would depend on the size of the pipe. I averaged that up.

Q. Well, take the 36-inch main.

A. On the 36-inch main you would have, except when lowering into the ditch, which has to be done by derricks, you would have a larger proportion of caulkers; it is more trouble to caulk the 36-inch joints—it would take two men,—than it would the smaller ones. A man to caulk a small joint—he could caulk it alone. With 4105 the larger it is convenient to hasten the work of caulking and to employ a couple of men on it, one on each side, around the top and underneath, one working opposite the other.

Q. Coming to your pavement because of replacing, that you say for the new pavement you have taken $2.75 per square yard. Did you observe from Mr. Simpson's testimony what the actual condition was as to replacing asphalt pavement, that the gas company is obliged to let the asphalt company do that, the asphalt company guarantees the pavement, and has to pay the asphalt company an average of $3.25 or $3.50 a yard for replacing it.

A. I think that is the case. I remember it was $3.25 as stated.

Q. Why did you take only $2.75 per square yard?

A. On account of being these repair jobs here and there, running around with their apparatus and tools, instead of doing a straight job right straight around; it ought to make even more difference than that.

Q. Didn't you know that the charge was exactly the same for a long trench as for a repair job in New York City, for asphalt pavements?

A. There is no such job as involves the total relying. I suppose a man is entitled to deduct for the size of a job in a case of this kind. I suppose they make even better terms than that. I am told they would make terms of $2.50 a square yard.

Q. Who would?

A. The asphalt companies?

Q. Don't you know that by law they are allowed to charge the contract price for all jobs?

A. No, sir. I know nothing about the law on it but if they get an extra job like that and make a good big profit they would be very likely to cut it and would undoubtedly do so.

Q. But we have already seen you could not put down all the mains in New York City as a wholesale job, in the natural course 4106 of events. Now if it be true that the charge of the asphalt company for the replacing of all the pavements over a long trench and the price which they may legally charge, is very much more than $2.75, then that would add materially, would it not, to the figures which you have given as the cost of replacing pavements?

A. Yes, if you had to give them that, but I have been assured they would take it at $2.50 in quantities.

Q. Do you know that the price that the company has been obliged to pay for the replacing of the modern pavement outside of asphalt, was $8.00 for the first yard and $4.00 for all other yards?

A. I saw that in the testimony, yes, sir.

Q. You didn't make any allowance for that? You put that in also at $2.75, didn't you?

A. No, I didn't put that in at $2.75. I know that the first yard is worth double on a small job; the very difference between $8.00 and $4.00 indicates why they charge so much more for the first yard in doing patchwork jobs.

Q. You understand the entire trench costs $4.00 a yard for all the yards except the first, that that is what the company has paid and been compelled to pay to the city?

A. Well, compared with this that is a retail operation; that is, it is a very small operation compared with the length of the mains.

Q. You assumed that the city, if all these mains were to be replaced, would do this for $2.75 for modern new pavement other than asphalt, when they have charged us $4.00 per yard?

A. Yes, I think they would do it for that and be glad to.

Q. You understand that this new pavement is laid by the city itself, except the asphalt, while the asphalt pavement is laid by the asphalt company under the agreement with the city?

A. This pavement you are referring to, concrete pavement?

4107 Q. I am referring to granite on concrete as distinguished from the asphalt?

A. I do not see why it should cost any more.

Q. If it does cost more and we pay the city more for it, why shouldn't you include the actual cost to us instead of assuming a lower figure? Have you any notion that the City of New York would make a concession from the prices which it may legally charge because we want to tear up all the streets instead of a few of them?

A. I think there are always concessions made on large contracts, yes, sir.

Q. Even by the City?

A. Yes, sir; I think the City would.

Q. Is that the only ground on which you put $2.75 down here instead of prices that the company has actually paid?

A. No, basing it on the experience I have had that where a new gas works is constructed the City is always very eager to help it along and they will do a great deal to further it. That has been my experience.

Q. Then you are taking and computing even on that assumption the price on which you think the pavement could be replaced and not the cost which the company has actually been under where it has laid pipe under pavement of that sort?

A. No, not for piecemeal jobs.

Q. Now, do you know the actual cost to contractors of laying down pavements, asphalt, granite on concrete and the wooden block, per square yard?

A. I have consulted quite a number of authorities on it and also the cost to cities, for laying pavements, and have a recent compilation with regard to that, going into it very extensively——

Q. Well, I am talking about the City of New York, not elsewhere, because labor may be higher, congestion of the streets may interfere with workmen, and various other considerations arise?

A. Well, I have allowed what I thought would be a very
4108 considerable margin over what is done in other places.

Q. Well, you have allowed figures that you have taken, or estimates that you have made in getting your total, instead of the total cost to the company, of laying under these new pavements, have you not? Now, won't you give me an answer to that?

A. I have used my own.

Q. And not the figures of the company's own experience?

A. No, I have not used your experience in regard to it; I am using my own.

Q. You say you have never laid any pipes in the City of New York and, therefore, you haven't any experience in the City of New York, have you?

A. Well, not in the City of New York.

Q. Nor in any other big city in recent years in the East, have you?

A. No, sir; but I know their cost——

Q. Well, you think you know. We think you do not. Now, did you know that in replacing the old pavement we had to use sand, use six inches of sand?

A. You always have to use sand when replacing——

Q. Did you know how deep to lay the sand?

A. You have to imbed the pavement in sand and fill in the interstices; always do that.

Q. Do you know how deep we have to lay the sand below the pavement?

A. You have to make a good bed.

Q. How much?

A. It depends upon the kind of pavement.

Q. Do you know how much in New York City for ordinary old pavement, how much the specifications of the City call for?

A. No, I do not. I only know it would make good paving——

Q. But do you mean to say you have made an estimate of cost of laying the old pavement in the City of New York without knowing
how much sand the City's specifications required to be used
4109 under the old pavements?

A. As far as that I gave a figure larger than Mr. Simpson gave in his testimony.

Q. That may be, but I am testing the accuracy with which you made these calculations and your own knowledge. Now, do you know how much per yard sand costs us in the City of New York to put under the pavement?

A. I don't remember. I know that I figured in the cost of paving here as common paving laid in sand, imbedded in sand, as thirty cents.

Q. Do you know how much sand costs per cubic yard, delivered at the works I mean, of course?

A. I don't suppose it is any——

Q. Well, do you know?

A. No. I don't remember what the sand costs. I just estimated it as a whole.

Q. Do you know what sand costs on the dock in New York City?

A. No, sir. It is a matter of small consequence in this figure.

Q. You could not make any computation, could you, that was reliable unless you did know how much sand was required below the block pavement in the first place, and secondly, how much sand cost, could you?

A. Well, after——

Q. Could you make any exact estimate without knowing those details?

A. I just have doubled the ordinary figure, and as the whole total was only $34,953.00 I did not go into figuring out how much the sand cost or any other small detail.

Q. Oh, no, you have $34,953.30. I am trying to find out whether that was an exact figure or a conjecture on your part?

A. No, it was not a conjecture. It is double the figure we would do it for elsewhere. There is 30 cents a yard; that is what it was.

Q. But you don't know how much sand the City's specifications require, nor what sand costs in New York City?

4110 A. There is sand enough to cover it, I know.

Q. Will you answer the question?

A. I didn't think it was of the slightest importance.

Q. Will you answer the question?

A. I don't know what sand costs in the City of New York.

Q. And do you know how much sand the city's specifications require?

A. No, sir, I don't know what they require on that item of $34,000. I know that it is about double what they——

Mr. Mathewson: I move to strike that last part out.

Motion granted.

Q. Do you know how labor in New York City compares with the prices of labor of the same class in Danbury and Asheville and other cities with which you have had experience?

A. They bring the men right from New York, the same class of men they use—"Dagoes." I don't see any difference in the men. They are ordinarily the same men who go back and forth on these jobs.

Q. You think you used the same men the Consolidated Gas Company has on its force, in Asheville?

A. Not the same identical men, but men of the same class.

Q. Don't you know that the Consolidated Gas Company does not use Italians at all in its work?

A. Well, that is where they lose then because they are the best kind.

Q. Well then, the "'Dagoes,'' as you call them, that you have used, evidently have not been people that have been working in the City of New York, were they, in gas mains?

A. They are very good pipe layers.

Q. I know, but that is not the point at all. I am asking if you know how classes of labor, pipe layers and caulkers and so

4111 forth, compare in Asheville with New York City?

A. I thought we were speaking about common laborers. I am not talking about the caulkers. I stated that I allowed $5.00 a day for caulkers. I allowed $2.50 for a——

Q. Do you know how that compares with the other cities with which you have had experience?

A. Why, it is larger.

Q. Do you know what they have to pay for common labor of different degrees in Asheville?

A. Well, I know they are about the same price, $1.75.

Q. Do you have to pay $1.75?

A. Oh, no, you can get "Niggers" there for a dollar a day.

Q. Now, look a minute at these photographs. Who took these? Did you?

A. I did, yes, sir.

Q. Yourself?

A. Myself.

Q. Who is holding the measure?

A. That is Mr. Cowperthwait, a son of the superintendent of Danbury.

Q. A son of the superintendent of the Danbury Gas Works?

A. Yes, sir.

Q. Don't you know it to be a fact here that when a ditch is temporarily covered, as it appears to be in all these photographs, where it is covered at all, that traffic breaks down the edges of the permanent pavement frequently so that when the asphalt company or the city comes to repave that they have to repave many inches wider than the original trench?

A. That is just what I wanted to show—how much came in of that kind? That is what the photographs are intended to show. It shows the bad places——

Q. That is not paved at all in the photograph yet, is it?

A. No, but it shows the holes there and here it goes straight.

Q. Don't you understand that heavy traffic along the street breaks in the edges next to this covering so that if the repaving is not done for weeks afterwards, as it frequently is not, it is broken down on the edge, so that the repavement includes a much broader
4112 space than indicated here?

A. No, I do not.

Q. You did not know that was the experience in New York City, did you?

A. No, the holes shown in these photographs were made independent of that ditch entirely.

Q. Why didn't you photograph a repaved ditch so as to show how wide the repavement actually went?

A. Well, I was looking for those, been on the inquiry to get such cases as that.

Q. But you could not find one?

A. Well, you have got to find one that is recent because it gets worn in so it would not show in the photograph the limits of the paving, but I did find a place where I saw how much trimming was done to make the fresh edge on the asphalt, and I found that I made an excessive allowance for it.

Q. Didn't you know in many instances, in the City of New York, that the repaving of trenches over 30 or 36-inch mains where the repaving was not done promptly after the filling of the trench, required a repaving to the width of six or seven feet, due to the breaking down of the edges of the pavement by the heavy traffic?

A. No. I do not figure on anything like that.

Q. Did you or did you not know that that situation existed in the City of New York?

A. No, I don't know it. I haven't seen it.

Q. Did you make any allowance for sheathing or shoring up of the ditch?

A. No, on a ditch that depth I made no allowance, except the exceptional cases of having to shore on account of a deep ditch I included in the ten per cent. I considered ten per cent. a large allowance for such cases.

Re-direct examination by Mr. KIRBY:

Q. Have you made any comparison of the width of trench allowed by you with the width set down in the report of the 4113 Board of Revision relating to the section, "Distribution of Gas, American Gas Institute, Chicago, 1906"?

A. Yes, sir; I compared them.

Mr. MATHEWSON: What is this, cross-examination? If not, how can you refer your witness to the authorities? That is already settled.

Mr. KIRBY: The authority has been referred to.

Mr. MATHEWSON: Not by me.

Mr. KIRBY: You asked him what the pages there was when you were speaking in regard to the weight of the lead used in the joints—referred to by you and the title read by you.

Mr. MATHEWSON: No, sir, not for a minute. I didn't even know the title. That is not competent.

Mr. KIRBY: It is as competent as the other question.

Mr. MATHEWSON: I didn't ask him any question on the subject.

The MASTER: That seems to be so, Mr. Kirby.

Mr. KIRBY: Well, I will put in the answer under the objection, if I may.

The MASTER: Yes.

Mr. MATHEWSON: Exception.

Q. Did you or did you not find the width of trench taken by you as wide as those given in such report?

A. I think with the exception of some of the larger they are fully as wide and some of them wider. The large sizes are slightly less, on account——

By Mr. MATHEWSON:

Q. Your figures are slightly less?

A. My figures are slightly less, on account of the width I saw in use in New York for laying mains.

4114 By Mr. KIRBY:

Q. By the large sizes you mean 30 and 36-inch?

A. No; from 16 up; 24-inch particularly referred to. This is a

24-inch main on the 3-foot width at the ditch on this photograph (indicating one of the photographs marked in evidence).

Q. The average width of such trench as set down in this report to which I have made reference for the 24-inch main is 40 inches, is it not?

A. Yes.

Mr. Mathewson: It is 44 at the top.

Mr. Kirby: And 36 at the bottom.

Mr. Mathewson: But 44 has to do with the repaving.

The Witness: That is just where the difference comes in. The practice here in New York City is to make it narrower at the top in order to avoid a bill of paving. In the book they make it wider at the top and narrower at the bottom. The paving is not in question. There is an evident desire to avoid large payment for repair of pavement and they cut the pavement just sufficient to let the bell into the ditch. That is about the amount of it. In fact one foreman told me he sometimes cut out for the bell.

Q. Taking these figures and computing them as they are in the table in this report for 24-inch pipe, we have a width on top of trench of 44 inches and a width of bottom of trench of 36 inches. What width of trench did you use?

Mr. Mathewson: Doesn't it appear what he used? Is it necessary to go into that

A. I used 36 inches.

Q. For the 20-inch pipe we have in this table a width at top of trench of 36 inches and a width at the bottom of trench of 32; what width did you use?

A. 30 inches.

4115 Q. In the 16-inch in this table we have width at the top of trench of 32 inches, bottom 28 inches; what did you use?

A. I used 28. The same.

Q. On the 12-inch we have a width at the top of 28, bottom 24; what did you use?

A. 28 inches.

Q. In the 10-inch we have a width at the top of 26, bottom 22; what did you use?

A. 25.

Q. In the 8-inch we have a width at the top of 24, bottom 22; what did you use?

A. 24.

Q. In the 8-inch we have 24 at the top, and 22 at the bottom and your figure was what?

A. 22.

Q. 6-inch, at the top it is 22, bottom 22?

A. Oh, excuse me. It is 24 on the 8 inches.

Q. And for all the other sizes in this table we have a width at the top and width at the bottom of 22; what did you use?

A. 22, I used.

Recross-examination by Mr. MATHEWSON:

Q. So long as the Consolidated Gas Company has to pay the city or the asphalt company for repaving it would be to their interest, would it not, to make the top of the trench as narrow as they could and properly do their work?

A. Certainly.

Q. Now let me call your attention to one or two other things in this book to which Mr. Kirby has referred. See if I quote correctly at page 15:

"Depth of Main. The trench should be dug to approximately the depth at which the main is to be laid, and no fixed rule can be prescribed for the depth at which mains should be laid. In a general way it is governed by these conditions: the question of getting below the frost line, the matter of avoiding obstructions and the question of securing sufficient pitch for drainage. In addition to these the mains should also be laid deep enough to avoid any trouble caused by the jar of traffic on the street. The first three 4116 conditions are purely local, and the frost line has been given as five feet deep for 30 degrees below zero. In order to be below the jar of traffic the pipes should be laid to cover at least three feet deep in large cities where there is heavy traffic and 30 inches in the small town."

Have I quoted correctly from this same book?

Mr. KIRBY: Objected to on the ground that if the other question was incompetent, I think this is incompetent.

The MASTER: It will be allowed.

Mr. KIRBY: Exception.

Q. Did I quote that correctly?

A. I think it is a correct quotation. I differ in regard to the jar of traffic on asphalt pavements.

Q. That is quite obvious, but I merely ask you if this was a correct quotation from this authority, and you say yes, and that is all I have to ask on it.

A recess is now declared to 2.15 P. M.

4117 After Recess.

WILLIAM J. LOGAN, called as a witness in behalf of the defendant, the State of New York, being duly sworn, testified as follows:

Direct examination by Mr. PAGE:

Q. Mr. Logan, what is your occupation?

A. I am president of the Logan Iron Works.

Q. How long have you been connected with the Logan Iron Works?

A. Since 1868.

Q. What particular line of business does the Logan Iron Works do?

A. Contracting and general iron work for oil and gas, boiler works, pipe work.

Q. Do you or does that company build tanks and holders?

A. We build tanks and holders and purifiers, condensers, wrought iron pipe; we have built roofs and smoke stacks, boilers, oil tanks and general appliances.

Q. For how long a time have they built those various appliances of which you have just spoken?

A. Ever since I have been with them and before.

Q. Have you been connected at any time with any gas companies?

A. I was director in the Williamsburg Gas Company and Brooklyn Gas Company and Citizens Gas Company of Brooklyn.

Q. But you have, I understand, never had anything to do with the operation of a gas plant?

A. No.

Mr. Mathewson: That is not the present Brooklyn company?

The Witness: No, the present company is the Brooklyn Union Gas Company.

Q. You were connected with the three companies you mentioned prior to their consolidation with the present Brooklyn Union Company?

A. Yes.

4118 Q. Have you visited the works of the Consolidated Gas Company?

A. I have.

Q. And made an examination of their plant?

A. Yes.

Q. And at such examination or during such examination you made an estimate upon the value of a certain portion of the apparatus?

A. I did.

Q. And as I understand, you did not make a valuation of the buildings?

A. No, I did not.

Q. Nor of the generators for the water gas plants?

A. I made no estimate myself an anything except such as I would be prepared to qualify for reproducing at the price new, and then only in regard to—there was a great deal that I could have made estimates on that I did not do, that was in conjunction with the buildings; roofs, for instance.

Q. Now, in the course of your investigation you visited the 18th Street station or plant of the Consolidated Gas Company?

A. Yes; I did.

Q. For what purpose is that station now used?

A. From general appearances and from what Mr. Riblett told me, the man in charge, only as a distributor station and holder station; there were some repairs going on there, repair shops and so on.

Q. Some portion of the premises used as a repair shop?

A. Yes. There is a small experimental gas works there that was not working, but Mr. Riblett told me that they did use it for testing coal.

Q. Well, outside of the machinery and apparatus necessary for the distributing station and the repair shop and this small experimenting gas station, did you find any other portion of the gas works on those premises?

A. Oh, yes; there is a large purifying house and lots of benches and exhausters and scrubbers and many things of that kind, but they were not in use.

Q. Are you sure about there being benches there?

A. At 18th Street?

4119 Q. At 18th Street?

A. Quite sure. They are not on that schedule.

Mr. MATHEWSON: We found we omitted some things from the schedule after we got through, and that is probably one of them. They are not very extensive, but there are a few things.

The WITNESS: It was only that I might not make a mistake, but I remembered that one end of the house wash gone, that was over the benches, and the benches were all there and condensers and scrubbers and engines and a lot of other things, practically a complete gas works.

Q. You say one end of the building in which the benches were situated was torn out?

A. Yes.

Q. And a portion of the benches had also been taken away?

A. I did not pay attention particularly. There were some that looked as if they had been dismantled in the end towards the river.

Mr. MATHEWSON: Everything that the City took has been taken down, I am told, by Mr. Bradley.

Q. What portion of this 18th Street plant did you particularly value, Mr. Logan?

A. My recollection is only the holders.

Q. Now, will you describe the holders that are there?

A. There are two holders in the house and four holders out in the lot, I think, between 19th and 20th Streets, uptown, and towards the river, that are in the house.

Q. What are the sizes of the holders that are in the house?

A. I did not measure them.

Q. I mean by capacities?

A. Well, I was governed by the capacity given here, 205,000 cubic feet.

4120 Q. You assumed the measurements and capacity as given by Mr. Mayer to be correct?

A. I did.

Q. Now, what do you say is the value of those holders, what would it cost to reproduce them new?

A. The two holders in the house, I valued to reproduce just the holders and the tracks and the guide rails and the columns there of wood and the bottom rollers, for $19,000. The four holders I estimate that to make new of equal capacity——

Q. The four holders are 255,000 cubic feet capacity?

A. Yes, the four holders new with columns of modern construction and holders to correspond in size and description with these with tank iron work and inlet and outlet carried to the drip, at $72,000.

Mr. MATHEWSON: Does the witness include in that the inlet and outlet connections?

The WITNESS: Yes.

Q. Now, these two holders, Mr. Logan, are enclosed in a brick building?

A. Brick and brownstone front.

Q. Yes, brick and brownstone trimmings or front building, which Mr. Mayer values at $155,784. Do they now build buildings around gas holders or in which gas holders are kept?

A. I do not think they do in the United States any more.

Q. And if you were called upon to reproduce or to build gas holders of these capacities you would surround them with an iron frame, wouldn't you?

A. Yes.

Q. What would that iron frame cost which would take the place of this building valued at $155,784?

A. Well, I am only guessing at that; I should say about $6,000 or $7,000 apiece.

Q. Would it be good engineering practice to build holders of that small capacity now, where you need the storage capacity that they use at 18th Street?

4121 Mr. MATHEWSON: If the Master please, I do not wish to interrupt the counsel, but I wish to object to this as immaterial and irrelevant. The plant which we now have has been built up and is the one which must be taken into consideration.

Mr. PAGE: Oh, not necessarily.

Mr. MATHEWSON: That is my view, and I wish to object to that and similar questions as to any hypothetical or ideal plant, without interrupting each time.

The MASTER: Yes. I will overrule it.

Mr. MATHEWSON: May I be considered as having an exception without interrupting each time?

The MASTER: Yes.

A. I think not.

Q. What size holders could you put upon this ground space that they have at 18th Street devoted to holders, and what would they cost?

A. You could put two holders to get the most possible capacity, I should say you might get close to 600,000 feet each. You could put up 500,000 feet, I know.

Q. That is upon the ground that is occupied by the two holders now of 205,000 feet?

A. That is right.

Q. How much would one such holder cost to erect?

A. Well, a 500,000 cubic foot holder there would cost in the neighborhood of between $45,000 and $46,000.

Q. Would that be with the tank?

A. That is with the tank.

Q. And that would be with a steel tank, would it?

A. A steel tank.

Q. And in giving the values which you have given you have not valued the tank because these are in brick tanks?

A. These are in brick tanks.

4122 Q. How about the four holders of 255,000 cubic feet capacity, would you now build larger holders, and what would they cost?

A. Well, I think that on that ground you could put up a 5,000,000 foot holder and tank.

Q. In place of the——

A. Of the four 255,000 feet capacity tanks.

Q. In place of the four which are 1,020,000 altogether?

A. Yes.

Q. It would be more economical to have one holder of a million capacity than four holders of 255,000 capacity?

A. That is to build?

Q. Yes.

Mr. Mathewson: Do you mean in construction or operation?

Mr. Page: Yes, in construction.

A. In construction it would be very much cheaper to have one of one million feet.

Mr. Mathewson: Per thousand of capacity?

The Witness: Yes.

Q. Well, do not let Mr. Mathewson lead you off into strange ways. I asked you whether it would be cheaper to build one holder that would hold a million feet than four holders holding 250,000 feet each?

A. It would.

Q. Without any regard to unit of capacity. Did you value anything else at the 18th Street Works?

A. I think not.

Q. Well, the 18th Street station is not used now as an operating plant for the making of gas, is it?

A. Not that I could see.

Q. Did you also visit the 14th Street plant of the Consolidated Gas Company?

A. I did.

Q. That is a coal gas manufacturing plant, is it not?

A. It is.

4123 Q. And as a manufacturing station is that a modern up-to-date plant or not?

Mr. Mathewson: Is the witness qualified as a gas expert, I mean in the sense that he can answer those questions? It seems to me, not.

The Master: Senator Page, what do you think about that? There may be some question about it. He testified that he manufactured various kinds of gas machinery but never managed a gas plant and he says he was a director in several companies. Do you think that qualifies him?

Mr. Page: I will withdraw the question. I will not press it.

Q. What portion of the plant did you examine, or, you might begin and state what is the first item in that plant that you examined?

A. The first one here is one T. F. Rowland, boiler 60 inch by 16, 8 h. p. boiler it is here; I valued that at $1,800.

Q. Did you include in that valuation of $1,800 the Clarke Steam and Fire Regulator which was separately valued by Mr. Mayer?

A. I did.

Q. What was the next you valued?

A. Cast-iron tank, 32 by 48 by 4 feet 6 inches, over boiler house forming roof. I did not see that. I estimated that from this sheet, and took an average thickness of ⅝ths of an inch thick, and I figured that that is worth $2,500.

Q. The next is a large purifier house?

A. The next is two condensers, two rectangular tubing, cast-iron——

Q. What value did you place upon that?

A. $26,000.

4124 Q. I believe in the large purifier house there are two sets of purifiers that you practically agree with Mr. Mayer in regard to the value. Is that right?

A. Yes.

Q. And also in the small purifier house, that you practically agree and accept his valuation?

A. Yes.

Mr. Page: Mr. Mayer's item for the large purifier house is $46,432 and for the small purifier house $15,987.

Q. What is the next?

A. Two tower scrubbers.

Q. The small boiler house comes before the scrubbers, locomotive boilers 35 h. p.?

A. Yes. I valued that at $1,400.

Mr. Mathewson: Which house is that?

Mr. Page: Small boiler house.

Q. You valued the locomotive boiler 35 h. p., 5 ft. diameter, of shell by 14-7 sixty 3-inch tubings, at what?

A. $1,400.

Q. Now, the tower scrubbers, Mr. Logan?

A. I valued them at $36,000.

Q. Two tower scrubbers 20 ft. diameter by 84 ft. 2 inches over all?

A. Yes.

Q. Capacity each a million cubic feet per twenty-four hours?

A. Yes. One moment, these should be added (indicating).

Q. You did not take that into consideration when you made that valuation?

A. No.

Q. Just take those matters into consideration. As I understand it—what was it, the water tank and wheel?

A. The water tank and inclosed circular stairway are not included in this rate.

Q. Supposing you take your pencil and figure that and see. I call your attention to that and ask whether they are in?

A. I figured away at the scrubbers here at 602,000 pounds at 6

cents, which is a fairly high price, making $36,000. Now,
4125 to that should be added the weight of the tank, that is 14 feet
diameter, that would be 157 feet in the bottom and 132 feet on the sides would be 289 feet, and I suppose that is ¼ inch. If it was quarter inch there with an angle iron top and bottom and flanges and all that sort of thing, it would weigh 4,500 pounds which at 6 cents would be $210. The inclosed circular stairway between scrubbers, I would say, guessing at it would be in the neighborhood of $3,500. That would add $3,710 to that, would make it $39,210.

Q. This tower scrubber is constructed with a double shell. Is that the usual way of constructing a tower scrubber?

A. I don't know. I have never built a tower scrubber. The ordinary scrubbers are not constructed with an inner shell. The tower scrubbers I don't know.

Q. Tower scrubbers, does it mean an upright scrubber or is it for a man's name?

A. No, because it stands upright.

Q. The air condenser, is that the next thing in the retort house that you valued?

A. Yes, one air condenser.

Q. What did you find the value of that?

A. $16,000.

Q. And on that you are $120 higher than Mr. Mayer?

A. Yes, sir.

Q. What is the next thing that you valued?

A. Wooden tank in the yard, two tanks 14-10 lower diameter by 12-10 upper diameter.

Q. I think before we come to that there is the boiler and engine house. Did you not state to me that you thought those figures were right?

A. All I said was that the 55 vertical boiler 4-8 diameter by 11 feet shell 160 2-inch tubes valued by Mr. Mayer at $713 was about right. Then there was another one, 37x6-9, I have no figures here but I think I put that in at $275.

4126 Q. Now vertical boiler 37x6-9, 66 2-inch tubes, 13 H. P. you valued at $275, is that right?

A. Yes.

Mr. **Mathewson**: Does he value this 150 H. P. cylindrical engine following the boiler?

Mr. **Page**: No, not the engine.

Q. You build *tr*acks?

A. Yes. That is $37, isn't it?

Q. $73?

A. Well, $73 if I remember right, that is not out of the way. It is low, if anything.

Q. You referred to the other boiler house. It follows the well house?

A. Well house, one boiler 4 Ft. x 10, yes, that is all right.

Mr. **Page**: He agrees with Mr. Mayer's valuation as to the contents of that boiler house. One boiler 4 ft. x 10 ft. 3, 20-H. P.;

and an 18-inch sheet iron stock, 15 ft. high; 1 Clarke and pressure gauge, being $589 for the boiler, $37 for the stack, $15 for the Clarke and $8 for the pressure gauge.

Q. Is there anything else before you reach——
A. I didn't say anything.
Q. There is another boiler, $2,720.
A. Two boilers, oh, yes. If those boilers are any good they are worth more than that.

By Mr. Mathewson:

Q. $2,720 and $234?
A. Yes.

By Mr. Page:

Q. Then you will accept Mr. Mayer's valuation?
A. Yes.

Mr. Mathewson: Don't you think where he cuts down Mr. Mayer's valuation where he thinks they are worth less that he should add in cases of this sort where he thinks they are worth more? 4127

Mr. Page: I suppose Mr. Mayer made a careful examination and found they were not as good as they should be.

The Witness: I have endeavored right along to give the prices at which I would make new ones for, and I would not make those new ones at any such figures as that.

Q. Now, proceed.
A. Wooden tanks. Same objection on that. I have got them down at $3,000.
Q. Yes; you value them at $3,000 and Mr. Mayer had the value at $2,600.
A. Next is six holders, 345,500 cubic feet capacity; I value them at $180,000; $30,000 apiece. Two more holders, 250,000 cubic feet capacity, I valued at $40,000.
Q. Mr. Mayer values those at $152,000, isn't that right?
A. I have made my prices fit what I would be willing to duplicate them for. The next is one large holder, 3,250,000 capacity; I valued that at $225,000.
Q. The large holder is in a steel tank?
A. Yes.
Q. And that valuation which you give includes the holder, guide frames and tanks?
A. Yes.
Q. These prices that you have given upon the holders are what it would cost to reproduce the holders new?
A. Yes.
Q. On the same ground that is occupied by the six holders of 345,000 cubic feet capacity, how large a holder could you build?
A. You could build one 5,000,000 foot and you could build in place of the other two, one alone of a capacity of half a million or

perhaps 600,000 cubic feet. That is of the six, where the six are located.

Q. Now, the holders of 250,000 cubic feet capacity, where are they situated?

A. Well, I only saw one holder there. I asked where these
4128 were and Mr. Liblett said up at 18th Street, and I only could see one holder there.

Mr. **Mathewson**: There are two there on the same ground, on the same block.

The **Witness**: I only saw one, going up in the car. It may have been shut out from my view in some way. I looked and saw only one. Mr. Liblett said so.

By Mr. **Mathewson**:

Q. Your estimate is on the theory that there are two there?

A. Yes, sir.

By Mr. **Page**:

Q. All these holders at 14th Street, are they of recent construction or have they been built some years?

A. They have been built a great many years, except the three million and a quarter.

Q. Now, these old holders that you value at $220,000, the eight holders together, that would reproduce those holders new to-day?

A. It would.

Q. And that is the value that you put upon them?

A. Yes.

Q. And of course the new holder would have the additional life as compared with the expiration of time since the old holders were put up?

A. It ought to..

Q. How much less than the value of the holder as reproduced new, do you think, the holder is as it stands there to-day?

Mr. **Mathewson**: Has the witness made such an examination as to testify to that? I understood him to say he observed them in passing by on the car.

4129 The **Witness**: No; that is, it was the two on 17th and 18th. No, I walked on the street the first time I was there.

By Mr. **Mathewson**:

Q. Where is it you are talking about?

A. 18th Street, the two small holders, and when I went by I thought I just looked up to see if the holders were there and the next time I was going up in a car and I thought I only saw one. That was in fact only yesterday.

Mr. **Page**: Now, may we have an answer to my question?

By Mr. **Page**:

Q. (Question repeated as follows:) How much less than the value of the holder as reproduced new, do you think, the holder is worth as it stands there to-day?

A. I would not want to say. If I knew the life of the holder and knew the number of years that it had been in use I could proportionate it. It is difficult to say.

Q. Now, we will take up 42nd Street, I think that was next in order. What is the first valuation you made there?

A. Eight purifier boxes, 20 feet by 3 feet deep——

By Mr. MATHEWSON:

Q. In what house is that?

A. Purifier house.

By Mr. PAGE:

Q. 20 by 22 by 3?

A. Yes.

Q. And these wrought iron covers?

A. Yes, $40,000.

Q. What about the next four purifier boxes?

4130 A. Four purifier boxes, 16 by 27 by 3 feet 6, $20,000. Next, four purifier boxes, $3,000.

By Mr. MATHEWSON:

Q. That includes the covers in each instance?

A. Yes.

By Mr. PAGE:

Q. What next did you value?

A. Next are two scrubbers, 8 feet diameter, 18 feet high, $3,000. This is not a copy of the original, and I know I made a price on that multi-tubular condenser. I can make it now or give it later.

Q. Well, give it now?

A. It has not the length of tubes here. I suppose they would be about 12 feet long for that size condenser, or 12 feet 6, 1,040 tubes. I would not care to give that answer yet. I want to be careful about it. It has not the length of tubes nor the size of connections. In a general way, though, I should say that that was——

Q. What is the next thing you estimate?

A. The next thing is one air condenser.

Q. How much did you value that at?

A. $12,000.

Q. Did you include in that valuation the two cast iron floors carried on steel beams?

A. Yes.

Q. How much would be the value of those two cast iron floors carried on steel beams?

A. I haven't the particulars here that I had before.

Q. Those Mr. Mayer in his estimate allowed for as part of the buildings?

A. No, I am not sure about that.

Q. What is the next thing? You can get hold of your details and look that up?

A. No, I couldn't have allowed for those floors, there is no data here. It is bracketed in here and I suppose there were, but those are not my figures where it is bracketed. Next is one cast iron box; I allowed $450 for that.

4131 Q. Cast iron box 7 feet 6 inches by 5 feet 6 inches by 9 feet deep?

A. Yes. These figures were made—to go back, I think that must have been included, judging from this other one, that floor must have been included but I didn't make the figures, all I made the figures on was just the condenser.

Mr. Mathewson: Does the witness mean the $12,000 were the figures he made and that they do not include the floors?

The Witness: It would seem to me as though they included the floors. I didn't make all these figures myself, that was done in conjunction with someone else, and these figures were put down by him. I figured on my part of the work and it is so much in excess of the other that is down here that it looks to me as though they must be included, floors and all.

Q. What is the next thing you estimated on?

A. One multi-tubular condenser 42 feet 6 inches by 5 feet by 14 feet high, 576 4-inch cast iron tubes, $4,000.

Q. What next?

A. There are a number of these things on which I put prices that are not down. I will have to leave those and put them in afterwards, containing those boilers.

Q. Get your data together this evening?

A. I would have to re-estimate them, that is all I can do.

Q. Well, re-estimate them. Go on and give what you can?

A. Under the head of tanks and scales, 1 tank, 5 feet diameter 25 feet long, ¼ seal; I have down at $1,200. The next seems to be gone, too, two wrought iron tanks 9 by 30, 8 feet diameter, 25 feet long, one 30 by 21 feet high, two 31 foot tanks, 1 wrought iron tank, 5 by 25. I will have to make that, too, later.

4132 Q. Return to the holders?

A. Yes. 4 holders 250,000 cubic feet capacity, $120,000.

Q. What would a million foot holder cost, and could you erect a million foot holder on the land space which you have there at 42d Street?

A. I think you could erect five million feet. The million foot holder would cost roughly $90,000.

Q. And you would have the same capacity that is covered now by the four holders?

A. You would.

Q. Would that be for the holder alone, or for the holder and tank, $90,000?

A. It would be for the holder and tank. Well, you had better say $100,000.

Q. Well, which?

A. Well, let it go at $90,000. I will build it for $90,000.

Q. And that is against $223,000 as the present holders and tanks were valued by Mr. Mayer?

A. $223,590, tanks and holders.

By Mr. **Mathewson**:

Q. You do not value, however, the brick tanks here?
A. I have not valued them, no.

By Mr. **Page**:

Q. Take next 44th Street. This is a water gas manufacturing plant, is it, of the Consolidated Company?
A. It is.
Q. You might state what part of the apparatus you have appraised?
A. Well, the same as——
Q. I understand when I say appraised, it is what it would cost to reproduce these identical articles to-day, is that right?
A. Yes. Two scrubbers in the scrubber house, $36,000.
Q. What is the next item?
A. Two rectangular condensers, $28,000.
Q. Cast-iron pipes, 30 feet long, 6 feet 6 wide, 3 feet high?
A. Yes.
4133 Q. What is the next item?
A. Two air condensers, 33 feet long, 7 feet wide, 23 feet high.

By Mr. **Mathewson**:

Q. In what house is that?
A. Under heading of air and salt water condensers. The figure here is $30,000, but I didn't put it down.
Q. Air condensers?
A. I got a record from my office which we got and gave it to the man who put this down and it has probably got mixed with something else, with the change in the present day price. I know that I put a price on these air and salt water condensers, and they will all have to be re-estimated.

By Mr. **Mathewson**:

Q. I did not quite understand what you included in that figure of $30,000, two air condensers. I find them here and one salt water——
A. No, I only referred to the air condensers. The figures are right opposite that and only opposite that alone.

Mr. **Page**: He will go over his figures. He does not seem to be very well prepared on that, and I will go to the holders and spend the rest of the afternoon on those, at the different stations, until he will get these details of the apparatus straightened out.

By Mr. **Page**:

Q. Turn now to the holders at the 44th Street station?
A. Four holders, $140,000.
Q. Of 375,000 cubic feet capacity?
A. Yes, sir.
Q. Now, one holder 2,000,000 feet capacity, two lifts?
A. $120,000. Next, two holders at $18,000, $36,000.

Q. The next is 99th Street, turn to the holders of the 99th Street station if you have them.

4134 A. Two holders, 600,000 cubic feet capacity, $70,000; one holder, $300,000 cubic feet capacity, $26,000.

By Mr. Mathewson:

Q. Do you mean $70,000 each?

A. No, for both.

Q. For two 600,000 feet, the two together for $70,000?

A. Yes. One holder, 100,000 cubic feet capacity, $12,000.

By Mr. Page:

Q. Is that all that there is?

A. That is all I see. I think that is all that there is.

Q. Now, we will take the 63d Street.

A. One No. 3 holder, $160,000.

Q. 65th Street, take that next?

A. Two holders, Nos. 1 and 2, each 325,000 cubic feet capacity, $52,000. Four holders, Nos. 3, 4, 5 and 6, same capacity, $104,000. Two holders, Nos. 7 and 8, each 4,000,000 feet, $400,000. That must be the total.

Q. Now, take the 111th Street station.

A. Two holders, each 5,000,000 cubic feet capacity, at $325,000 each; $650,000 for the two.

Q. Did you include in that 111th Street the connecting bridge and iron work?

A. Yes, sir.

Q. The next, I believe, is 132d Street, is it not?

A. 132d Street, I have $322,000 for the holder.

Q. That is practically a new 5,000,000 cubic foot capacity holder, 5 lifts?

A. Yes, sir.

Q. And what did you value that at?

A. $322,000.

Q. Now, we come to the Inwood, I believe, the last of the holder stations. That is one holder of 60,000 cubic feet capacity, 2 lifts?

A. I cannot make out whether it is $8,200 or $9,200, whether the eight is on top or the nine is on top.

Q. When you were there was this holder in use?

A. It was not.

Q. From the appearance of the tanks and the works would

4135 you say that it had been in use in some time?

A. I would not, there were no works there to amount to anything.

Q. Well, by the works I mean whatever pumps or enginees they had there?

A. Yes.

Q. And would you for any purpose now build a holder of that capacity or size at Inwood, for any use whatever?

A. For the Gas Company's purpose?

Q. Yes.

Mr. **Mathewson**: I object to that, the witness being incompetent to testify on that subject.

Mr. **Page**: He can say whether he would put up a toy thing of 60,000 cubic feet capacity at Inwood.

The **Master**: I will allow it.

Mr. **Mathewson**: Exception.

A. I think not.

Q. Have you valued this Inwood holder?

A. I am inclined to take the lower figure, $8,200, for it.

Mr. **Mathewson**: Had you not better find out surely?

Q. That could be very quickly ascertained, could it not?

A. If Mr. Bradley will tell me what pressure it throws, I can tell you.

Mr. **Bradley**: I don't know that I can tell you offhand.

The **Witness**: It would not throw over 2 inches.

Mr. **Mathewson**: Pressure for gas installation, 6 inches.

The **Witness**: It is worth more than that, then.

Q. Two lifts?

4136 A. I don't care about that. The 6-inch pressure is all I want and the diameter. I would build that to-day for $5,200.

Q. But, as a matter of fact, if you were reproducing a gas plant in the City of New York you woul not rebuild it at all, would you?

A. I would hardly think so.

The **Master**: If you have come to a convenient place we will suspend until 10:30 o'clock to-morrow morning.

Mr. **Page**: Yes, we have finished the holders.

Adjourned to November 23d, 1906, at 10:30 A. M.

4137 Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,
vs.
JULIUS M. MAYER, as Attorney General of the State of New York; WILLIAM TRAVERS JEROME, as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIEN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and THE CITY OF NEW YORK, Defendants.

Before Arthur H. Masten, Special Master.

NEW YORK, FRIDAY, *November* 23, 1906.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Page, Mr. Kirby, Mr. Burr.

4138 Continuation of the direct examination of WILLIAM J. LOGAN.

By Mr. PAGE:

Q. Do you desire to make a correction in your testimony, Mr. Logan?

A. The two million holder at 44th Street I got too low, at $100,000. They were just rough figures last night, and I would not care to say, under present conditions, I would build that for less than $120,000. That was the only thing I noticed. There are some others. The air condenser, the figures marked on my memorandum was $30,000, and I said when I gave that that I thought it was entirely too high. That is under the heading of air and salt water condensers.

Mr. MATHEWSON: Two air condensers, $30,000; what is the correction?

The WITNESS: I find our contract price for that was $14,770, and that it would be about the same price to-day. And then, also, I want to correct on the holders at 21st Street——

Q. Well, I think we struck out all the testimony in regard to that. If you will take up the holders at 21st Street, and give them. Four holders, each 400,000 cubic feet capacity, three lifts, diameter of outer section 88 feet, sixteen cast iron columns. What value do you place on them?

A. $182,000.

Q. Now, the holder of 1,500,000 cubic feet capacity?

A. $94,000. These figures are indistinct, and I have not had a chance to go over them, but that is approximately about right.

Q. You gave it before $84,000.

A. $84,000, was it?

Q. Yes.

A. Well that is a little bit low. The figure here I could not make

out whether it was a seven or a nine. $94,000 seems a little
4139 high; not very much. I would say in going over these things to make these present prices I have had less time to go over the whole of them than I would want to make an approximate estimate even on any one, and in order to follow this out, so I would be willing to carry out this contract price, I would have to give it at that price rather than change it.

Q. Do you want that to stand at $94,000?

A. I would prefer to have that $94,000.

Q. Turn over to the next holder—holder, 149,500 cubic feet capacity?

A. Without the inlet and outlet pipes, $35,240. The inlet and outlet pipes—this I took from our estimate of the weights, but the inlet and outlet pipes were both in one contract for $4,000. For the next holder, it is marked one and one-half million capacity, but it is not as much as that. That is $40,500. Inlets and outlets for both of them, $4,000. It would be fair to divide that equally between them, I suppose.

Q. That includes the steel tanks?

A. That includes the steel tanks, holders and guide frames.

Mr. Mathewson: Would it be fair to add $2,000, then, to each of the holders?

The Witness: I think so.

Q. That includes the steel tanks?

A. Steel tanks.

Q. That is all the holders at 21st Street, is it?

A. Yes.

Q. Now 42d Street; I believe there were some tanks that you wished to figure, were there not?

A. I am not sure what station it was; there were some I did not give. Yes, it was 42d Street.

Mr. Mathewson: The witness gave 42d Street.

Mr. Page: I know; but there were some tanks there that he said were to be figured.

The Witness: It is under the heading of oil and tar storage tanks.

4140 Q. You did not give any figures on that?

A. I did not give any at all. The first two wrought iron tanks, 9 feet diameter by 30 feet long I have averaged 5/16 of an inch thick, at $1,680. Eight tanks, 8 feet in diameter by 25 feet long, at an average of 5/16 of an inch thick, at $4,800. One wrought iron tank, 30 by 21 feet high, $2,440. One wrought iron tank, 5 feet long by 25 feet diameter, $325.

Mr. Mathewson: Is there any objection to the witness giving the thickness?

The Witness: The average thickness is one-quarter inch.

Q. What about these other tanks? Did you value those, these wooden tanks?

A. I did value the wooden tanks in my original estimate. I can do that now. (After referring to paper.) It does not give any depth to them, so I would not be able to. It only gives 31 feet tank, and does not say what that 31 feet is.

Q. The one above there, 38 feet by 15 feet 6 inches?

A. One wooden tank 38 feet by 15 feet 6 inches, I would say that price is about right for that.

Q. That is, $540?

A. $540.

Q. Now, if you will turn to the 44th Street station, one stone water condenser?

A. I made an estimate on that, but it is not here.

Q. Well, can you make one now?

A. Yes, but it would take some time.

Q. How long?

A. And there is another following it, and I would have to make the same. I would say, roughly, that those prices are about right, from my general experience of those things.

Q. Well, take up the next thing—water tower?

A. Marked here as $3,000. That is too high.

Mr. **Mathewson**: What is it we are talking about?

4141 The **Witness**: One water tower tank 20 feet diameter by 20 feet high, ⅜ and ¼ inch.

Q. It says above there "all."

A. When we made these figures together that duplex pump was in there at $3,000. That tank would be worth, assuming it to be ¼-inch bottom——

Mr. **Mathewson**: Will you give us the tank, because there are several here? Is this the one under water towers?

The **Witness**: One under water towers, continued.

Q. One 20 feet diameter by 20 feet, ⅜-inch and ¼-inch shell?

A. $1,200 is not out of the way for that at all.

Mr. **Mathewson**: Well, the estimate was $1,333, without depreciation, as the original cost. $1,200 was after ten per cent. depreciation was taken off.

Q. What price did you give?

A. I said $1,200 was not out of the way.

Q. Now, what was the next thing you valued at 44th Street?

A. The oil tanks under ground; I gave $17,500 for them.

Mr. **Mathewson**: How many are there of them?

A. Seventeen? Do you understand, I have made these on a basis of what I would take it and reproduce them for to-day, as nearly as possible?

Q. Then there is another oil tank below there. What is the value of that?

A. One tank, 8 x 30, that is $1,000.

Q. Now, there are some steel tanks right below?

A. Three tanks, one 10 x 7 feet, one 6 x 10 x 4 feet, and one 6 x 10 x 4 feet 7 inches, $800.

Q. Now, what is the next?

4142 A. The next that is down here is storage tar tanks; the value here is $4,000. That is entirely too much.

Mr. Mathewson: You mean down on your memorandum?

The Witness: Yes. There were only three tanks, 6 x 8——

Q. Before you get down to that, there are some more tanks.

A. There is no value on this, although I know I made a figure on them. Roughly speaking——

Mr. Mathewson: Which are we talking about now?

The Witness: No. 6 and No. 9 oil tanks, 40 feet diameter by 16 feet high, constructed of steel, set in circular pit, capacity 150,000 gallons each. I figure those as of an average thickness of 5-16ths, and they would be worth $2,700 apiece.

Q. That is $5,400 for the two?

A. $5,400 for the two.

Q. Now will you figure the three storage tanks constructed of wrought iron.

A. The size of tanks marked here is 10 inches diameter by 6 feet deep. I assume that must be 10 feet diameter.

Mr. Mathewson: Yes, it is three storage tar tanks, constructed of iron.

The Witness: Yes.

Mr. Mathewson: 8 x 8 x 7 feet 6 inches.

The Witness: And then below is size of tanks.

Mr. Mathewson: 10 x 6 feet.

The Witness: It does not say how many of those there are. It says side of tanks, 10 x 6. I can give you a figure for those three, 8 x 8 x 7 feet 6, if you want it.

4143 Q. Yes.

A. Of ¼-inch iron, they would be worth $250 apiece.

Q. That would be $750?

A. $750.

Q. The next item I see according to this figure——

Mr. Page: Have you got the number of the fuel oil tanks or benches set inside of corrugated iron buildings? It does not seem to be given in the testimony. It seems there are three.

Mr. Mathewson: Three.

The Witness: Those will be worth $190 apiece.

Q. That would be $570?

A. $570.

Mr. Mathewson: What would that make the total under that?

The Witness: $1,320.

Q. Right below there are two steel oil tanks, one 12 feet in diameter by 7 feet high, and one 10 feet diameter by 7 feet high.

A. Of ¼-inch iron, that would be worth $270.

Q. Apiece?

A. One of each, and the one below would be worth $210.

Q. The first one was $275?

A. If there were two of each?

Q. One of each.

A. One steel tank, 12 by 7, would be worth $270. It reads two steel tanks, one 12 feet diameter and one 10 feet diameter.

Mr. Mathewson: No, two steel tanks, 12 feet diameter, 7 feet high, and one 10 feet diameter by 7 feet high. There are two of the 12-foot tanks.

Mr. Page: That would be $540 for those two, then?

The Witness: Those would be worth $320 apiece, $640, and the other would be $210.

4144 Mr. Mathewson: And the three would be how much?

The Witness: $850 for the three. The next is tar separator system, 54 feet long, 15 feet wide, 6 feet 6 inches thick, 8 compartments—$2,500.

Q. If you will turn to the 21st Street plant now, and kindly let us know what you estimated there?

A. Two 60-horse power locomotive boilers, each 72 tubes. That price is not out of the way, $2,440. The price for the steel stacks is not too much.

Q. What is the next that you value?

A. Round wood tank, $360, is very high. I would not value that at over $200. That is under octagonal valve house, 7 feet by 7, round wooden tank.

Q. The next item that you valued is apparatus—retort house, three salt-water condensers; did you value those?

A. $70,000.

Q. Then there is another one—one similar condenser, in course of erection?

A. I don't remember that.

Q. Well, the value of a similar one would be?

A. One-third, or $23,333.33.

Q. The B. & W. boiler?

A. The last I knew of a B. & W. boiler sold for about—I have known them to be sold as low as $11 a horse power, but that was in big lots. I would say $16,500 was not out of the way for that. The last I heard of a fairly big order was $14.

Q. That would be $30?

A. No, there is a thousand horse power there.

Q. What price did you say then?

A. I would say that that was right.

By the Master:

Q. Two Babcock & Wilcox boilers, 500 horse power each?

A. Yes. And the Altman-Taylors are practically the same thing.

4145 Q. Two steel tanks, 7 feet by 110?

A. I should think that that price was about right.

Q. Now we come to some tanks—one round cast-iron tank, 15 feet diameter by 12 feet high. Did you figure on that?

A. $1,500.

Q. And two wrought-iron tanks, 6 feet in diameter by 4 feet 6 inches high?

A. The price would be about right there.

Q. $150?

A. Yes.

Q. What about this wrought iron rectangular tank in the ground, 14,000 gallons?

A. The size is 18 feet by 14 feet, by 9 inches here should be, I suppose, 9 feet.

Mr. MATHEWSON: Yes, nine feet.

The WITNESS: $640.

Q. Now come down to the oil tanks?

A. That price is about right.

By Mr. MATHEWSON:

Q. Won't you give the buildings?

A. It is under "Retort House, 22d Street, continued." One oil tank, 6 feet diameter by 10 feet deep; the price is about right—$176.

By Mr. PAGE:

Q. What do you say about the tank, 10 feet diameter by 30 feet long?

A. For ⅜ metal it would be worth $1,400 apiece.

Q. Ten of them?

A. Ten of them.

Q. $14,000 for the ten?

A. Yes, sir. The next, three-eighths, I assume, that is round tank, 11 by 40 feet long, $1,680. Two wrought iron tanks 8 by 12, ¼ inch, they would be worth $260 apiece; $520 for the two.

Q. Two wrought iron tanks 6 feet diameter by 10 feet high?

A. They would be worth $150 apiece.

4146 Q. $300 for the two?

A. Yes, sir. That is with the ¼-inch shell and bottom.

By Mr. MATHEWSON:

Q. Did you in that estimate include the setting of the tanks in position for work, or is it merely the tank unset?

A. Merely the tank, unset; no connections.

Q. And not transported and set in position?

A. That would be delivered on the sidewalk.

Q. But not set?

A. Not set.

Mr. MATHEWSON: It is not quite possible to compare the figures that the witness gives in that way with Mr. Mayer's estimate, because Mr. Mayer's figure was set.

Mr. PAGE: No. I will ask him to make his calculations with the settings.

The WITNESS: That would be an impossibility, without knowing the conditions of each and every one and how put in. There are some of those that would cost more to put in position than the tanks are worth, according to the location.

Q. These values you give are the values delivered on the sidewalk?

A. For all that may be delivered on the sidewalk. On some of them, some of these that are built in place, those are for in position.

Q. Like the holders?

A. Anything like the holders, that is built in position. Those prices being for put in position.

By Mr. **Page**:

Q. The vertical boiler—did you value that, in shed No. 5, right under your wrought iron tanks?

A. I did not. That is not out of the way for it.

Q. Do you mean that $478 is not out of the way?

A. That is not out of the way.

4147 Q. What is the value of the shaving scrubbers?

A. And there are steel tanks, 20 feet diameter by 30 feet high, 70,688 gallons, $2,000. That is under water power, yard.

Q. Steel tanks, can you give those? Have you those figures. If not, we will pass to something else. Take this new oil tank, 57 feet diameter, 30 feet high.

A. There is no value on that.

Q. You haven't given any?

A. No. All they have got for value there is $3,000 paid on account.

Q. Well, what about that steel tank 7 feet by 20, have you valued that?

A. Yes; $900.

Q. What thickness did you figure that at?

A. ⅜.

Q. Proceed with the others.

A. One steel tank, 20 feet 1 inch by 30 feet 1 inch, 8 feet 8 inches, $2,400; ⅜ metal. Twelve steel tanks 8 by 40, 9/16 inch, $18,000; $1,500 each. Ten steel tanks 11 feet diameter by 39 feet 6, ⅜ steel, $1,800; $18,000. The next are bunched. Steel tank 10 by 9 feet, wooden tank 16 by 15 feet, wooden tank 12 by 15, steel tank 16 by 50 by 2 feet 4 inches, ¼-inch steel; bunched at $3,000.

Q. That is, that is your value on all those tanks?

A. On all those tanks.

By Mr. **Mathewson**:

Q. Two steel and three wooden tanks?

A. Two steel and two wooden tanks.

By Mr. **Page**:

Q. That completes that?

A. Yes.

Q. 99th Street, I think, is the next (page 1535)?

A. $8,745 for air condenser outside of generator house.

Q. Now the salt-water condenser, cast-iron, in four sections, 31 feet long by 4 feet wide by 15¾ inches high?

A. $10,000.

4148 Q. Two 10 feet diameter by 24 feet high scrubbers, wrought-iron construction?

—. $18,000.

Q. In that valuation, do you include both the condenser and scrubber?

A. Certainly. Two 10 feet diameter by 24 feet high scrubbers and two 24 feet 3 inches by 5 feet 2 inches by 15 feet condensers.

Q. Now the tar separating system in the yard?

A. $2,400.

Q. Now the tar storage tanks?

A. Three tar storage tanks, 8x8x8, $720. Next 12 steel tanks, 8x40 feet, $14,400. Two steel tanks, 8 x 60. Oil storage tanks I have got down here, $3,600, but that is evidently wrong. I will have to figure that again.

Q. Well, figure it now, please.

A. No, sir, that is right—$3,600. One drip well tank, $728. Two hot scrubbers, 21 feet high, 8 feet 6 in diameter, $1,920. Two hydrogen scrubbers, 22 feet high, $1,680.

Q. Those are out of commission, those hydrogen scrubbers, aren't they?

A. I believe so. They are so marked.

Q. And the hydrogen scrubber was a part of the old *Tessie du Motay* system that has been abandoned for a great many years, wasn't it?

A. I believe so.

Q. The next item you valued there was what?

A. Boiler house, nothing there. Sturtevant blower, pump, water feeder—those you would have to buy or get quotations on. I did not value those. Next is miscellaneous tanks, one discharge, boiler feed tank, overflow tank, gas oil tank, one fuel tank, one gas oil tank; $1,200 for the bunch.

Q. Is that all?

A. That's all.

Q. Is there anything you valued at the holder stations beside the holders?

A. I am not sure.

Q. Take a look at 63d Street?

A. I don't think there is anything there except the holder that I valued.

4149 Q. There is nothing that you valued at 63d Street, then?

A. Nothing beyond the holder.

Q. 111th Street next. Under the head of yard: One oil tank, 43x20, ¼-inch, $2,200.

—. I would say that that is a value to make a new tank like that and in its place. As it is situated and not for use it is not worth anything more than scrap iron.

Q. What is it, just thrown out in the yard?

A. I do not recall that just now. No, it is not thrown out; it is in position and all, as I recollect.

Q. Well, if the plant is not being operated, there would be no use of that oil tank in a distributing station, would there?

Mr. Mathewson: Isn't that rather a question for a gas expert than a manufacturer of iron work?

The Witness: If they are not making gas they do not want any oil tanks. I should make the depreciation about 95 per cent.

Q. It is worth only so much scrap?

A. That is about all. To cut it down, to rebuild it is not worth the value of what the plates would be worth if you were going to rebuild it, and then you would not have a decent thing when you were through. The atmospheric condenser I have here at $4,000. That same thing pretty nearly applies to that, although the salvage on that would be more.

Q. That is all the apparatus that you valued, is it?

A. Yes, sir.

Q. Now, as I understand it, you were not able to figure the depreciation on these holders because of the fact that the length of time that they had been built was not given: Mr. Bradley has testified that the small holders have been built for forty years or over and that the larger ones have been built within the last twenty years.

4150 Assuming that the small holders have been built for forty years, would you say that a fifteen per cent. depreciation is sufficient?

A. I cannot say that I know what the life of a holder is.

Q. Well, a fifteen per cent. depreciation——

A. Would indicate a life of 240 years nearly. I hardly think they would last that long.

Q. In the valuations that you have given on holders and on apparatus that could be placed in position, what is your value based upon, the holder constructed and turned over to the company and the apparatus placed in position ready for operation?

A. The holders, large enough to be built in place, to be turned over to them complete. Small tanks and so forth to be delivered on the sidewalk.

Q. But on everything else the price that you have given is the price that you would build it for and turn it over to the company complete?

A. Yes.

Q. Have you taken into consideration in your value of holders and tanks an element of engineering?

A. I have not. That is, it is taken in, of course, but it is included in that price I have named.

Q. In the price named you have included engineering charges?

A. Yes.

Q. So that you would not add to your value, as you have given a five per cent. for engineering charges?

A. No.

Q. What do you say in regard to the necessity of charging interest on the holders?

Mr. Mathewson: I object to that. I think that is a conclusion that the witness is not entitled to draw, whether we are entitled to charge interest or not.

Question withdrawn.

Q. Would it be a proper charge for interest during the construction of the holder?

Objected to as a conclusion on which the witness is not competent to express himself.

4151 Mr. Page: I will withdraw the question again.

Q. Mr. Mayer has testified you should add five per cent. interest charge to the cost price of the holder. Do you agree with Mr. Mayer in that statement?

A. I do not.

Mr. **Mathewson**: The question was asked whether the company in the construction of the plant was entitled to add to its capital in the plant interest on the money during course of construction, interest which accumulated, and Mr. Mayer added five per cent on that theory, not on the theory that the contractor was to add five per cent. to the price.

The **Witness**: I did not understand it that way either. May I explain? I assume that this five per cent.——

The **Master**: You may explain, if you like. I think Mr. Page is entitled to ask the witness whether or not in getting at his figures he took into account any question of interest on capital during the period of construction, and, if not, to have him state, why not. Knowing that Mr. Mayer did take it into account and did state his reasons, I think this witness should have the same opportunity, and I think we should save time by letting him make his explanation. You may proseed, Mr. Logan, with the explanation you were about to make.

The **Witness**: I think that an allowance to the company should be made for the interest, but not at five per cent., because none of this work would take two years, and the estimate of five per cent. was for one-half of the time. None of this work would take—the
4152 largest sized holder ought to be built in nine to ten months, so that would only make the interest charge at the rate of five per cent. per annum for one half the time, and a great deal of this work could be done in a few weeks, some in a few months, so the interest account would be inappreciable.

Q. Now for the holders, that is, anything under a million-foot capacity—how long would it take to construct the small holders they have got, running from 250,000 to 400,000 or 500,000 cubic feet capacity?

A. Well, under favorable circumstances, up to half a million could be built in three months—you might run into six; but a fair and reasonable time for building up to a half a million feet holder would be between four and five months. For a million-feet holder it would be fair to allow at the outside seven to eight months. It could be completed though in considerably less time if everything went well.

Q. And on a five million holder, how long a time would that take?

A. Well, it would take close onto a year.

Q. And you think it would be fair to add to the price you have given interest at half of the period you have named in each period?

A. I think so.

Q. Now, on the other apparatus that you have valued, would you add anything to your figures for engineering?

A. No.

Q. Or interest?

A. I am outside of the interest question. That is something for the gas company, but I think five per cent. is too much for the gas company to add on that small stuff.

Q. And, as I understand it, all the values that you have given are of new work, and you have not taken into consideration the present condition of this plant as to depreciation?

A. I have not.

Q. Your figures are to purchase and deliver in place the apparatus and holders new?

4153 A. With the exception of the small stuff delivered on the sidewalk.

Q. The figures that you have given are such as you would be prepared to execute the contract for?

—. They are.

Q. If you were required to figure in competition, would you have given these figures?

A. I think I would have shaded these figures somewhat.

Q. You think you have given full prices?

A. I have intended to, and I think I have.

Cross-examination by Mr. Mathewson:

Q. Does the Logan Iron Works manufacture apparatus other than gas apparatus?

A. Yes, sir.

Q. Where are their works located?

A. In the 17th Ward, City of Brooklyn.

Mr. Mathewson: I think I will take these in the order Mr. Mayer testified.

Mr. Page: The 14th Street station first?

Mr. Mathewson: Yes.

Q. Referring to the 14th Street plant, Mr. Logan, you give a valuation for one cast-iron tank, 32 feet by 48 feet by 4 feet 6 inches in the boiler room at $2,500?

A. Yes.

Q. At what weight did you compute that tank?

A. I think, roughly speaking, it must have been 50,000 pounds.

Q. Well, if the weight was 90,000 pounds——

A. It would be $4,500.

Q. Now, referring to the condenser house, you give the valuation of two condensers No. 2 rectangular tubular cast-iron tubes, and so forth, 44 feet by 15 feet by 6 feet 2 inches at $26,000?

A. That is right.

Q. At what weight did you assume that?

A. It must have been 520,000 pounds.

4154 Q. Supposing it were 590,000 pounds weight?

A. 590,000 pounds?

Q. Yes.

A. It would be $29,500.

Q. Did you value the contents of the purifier house?

Mr. Page: I think he said he agreed with Mr. Mayer.

Q. Large purifier house, two sets, consisting of eight purifying apparatus.

Mr. Page: He gave the valuation on that.

Q. You gave a value for the entire contents of the purifier house and said you agreed with Mr. Mayer, didn't you?

A. I gave $48,000.

Q. And Mr. Mayer's figure was $48,876?

A. It is here $46,432.

Q. That is with the depreciation off, but for cost new you would not disagree substantially with Mr. Mayer's valuation of $48,876, would you?

A. I would not.

Q. And so too as to the small purifier house following, the contents of which Mr. Mayer valued at $16,828 new, or $15,987 after taking off 5 per cent. depreciation; I understand that you would not quarrel with those figures?

A. Of Mr. Mayer's?

Q. Yes.

A. No.

Q. $16,828 new?

A. I would not say that they were too much.

Q. Now, in the boiler house you value locomotive 35 H. P. 5 foot diameter, and so forth, at $1,400?

A. Yes, sir.

Q. Mr. Mayer's valuation was $1,918 without depreciation. What sort of a locomotive boiler did you assume that to be?

A. An ordinary locomotive boiler.

Q. Any special make?

4155 A. Such as we have made ourselves; ordinarily when we have them now we find that we can buy them cheaper than we can make them.

Q. Erie boilers?

A. No, I think you can get an Erie boiler for a great deal less than $1,400.

Q. This is a more expensive boiler than what is known as an Erie in your estimate?

A. Yes, sir, in my estimate I base it on what we would build it for.

Q. Did you inspect this engine yourself?

A. The engine or boiler do you mean?

Q. The boiler.

A. I only glanced at it to get a general idea.

Q. Referring to the yard, you gave a blanket valuation of $39,210; two tar scrubbers, and a circular stairway; what weight did you assume for the two scrubbers?

A. The weight in the schedule here.

Q. How much is that?

A. 603,262 pounds; I called it roughly 600,000 pounds, at 6 cents a pound.

Q. If the weight of those scrubbers was over 325,000 pounds, that would make a difference in the value somewhat would it not?

A. It would make a difference of $1,500 apiece.

Q. Was your valuation of this boiler a valuation delivered on the sidewalk or at the works of the company, or was it the value installed?

A. Installed, ready for use?

Q. Yes.

A. It was the boiler such as called for there. In *case a* like that we would deliver, if there is a chance for the trucks to get to the place, we deliver at or near the foundation, but we usually call that sidewalk delivery.

Q. Exactly. That is what I mean, but it does not include labor and expense of setting of the boiler?

A. There is no setting of a locomotive boiler.

Q. No, putting it on foundation?

A. That we call placing; the setting means brickwor*d*, if it is enclosed, the room.

4156 Q. You have included no brickwork or anything of that sort?

A. No.

Q. Simply the delivery of the completed boiler?

A. Simply the delivery of the completed boiler.

Q. One air condenser in the retort house annex, you have valued at $16,000 and Mr. Mayer's valuation is $16,335. If Mr. Mayer, after a careful inspection, made that valuation, you would not assume to say that it was too high, would you, $335?

A. I would not say. In ordinary estimates I would say that that was very close.

Mr. PAGE: That is, that Mr. Mayer was nearly right.

Mr. MATHEWSON: Or that Mr. Logan was nearly right.

The WITNESS: If we were bidding for it I would a great deal rather that he was $16,300 and that I was $16,000; I would get the job.

Q. Does this figure of yours for the air condenser in the retort house include the setting of that or sidewalk delivery?

A. That includes setting.

Q. Referring to your valuations under boiler and engine house of one 155 horse-power vertical boiler, $713, that is a figure also for sidewalk delivery, is it not, the same as this case of the other boiler?

A. Did I name a price on that?

Q. $713.

A. I simply said that that was about right; I think I said. I am not sure.

Q. Yes, Mr. Mayer's figures was $713 with three per cent. off for depreciation.

A. $713 is not out of the way, either.

Q. And the $75 for the sheet iron stack, you would not consider out of the way new?

A. No, I would not.

4157 Q. Now, the boiler under the boiler house and well, 37 inches by 6 feet 9 inches, you valued at $275 as against $350 for Mr. Mayer. Your $275 is for sidewalk delivery?

A. Practically sidewalk delivery.

Q. So, too, as to the boiler below, under boiler house 4 feet by 10 feet 3, 20 H.P., which you valued at $589?

A. I did not value it, I said the figures were not out of the way. I do not mean to spar with you——

Q. I understand, you are quite fair. His figures were $607 or 3 per cent. off for depreciation, $589; you would think his figures were about right?

A. His base figures, I could not pass on the depreciation without knowing it; the three per cent.—it might be as good as new.

Q. But his base figures of $607, new, you would not say was out of the way?

A. It is fair.

Q. And I think you said the same as to the 18-inch sheet iron stack which he appraised at $38. Now, under the boiler house later appear two 32 H.P. horizontal boilers which Mr. Mayer appraised at $2,860 and $234 respectively, and I understand you to say that you think those figures are fair?

A. Under the circumstances, may I make a comment?

Q. Yes.

A. That is a very expensive kind of boiler and you do not get the efficacy that you would in boilers of the ordinary type.

Q. But assuming that particular boiler?

A. That particular boiler there is not too high if it were to be duplicated.

Q. Referring now to holders at 14th Street, after giving a valuation for the six holders, you give a valuation for two holders at $40,000. What did you assume to be the weight of those two holders, 86 feet in diameter and 250,000 cubic feet capacity each, the total weight of the entire construction of holders, guide frame and connections which you valued?

4158 A. I am not exactly sure of the divisions of weight. I figured the holders at 8 cents a pound and the frame at 6 cents.

Q. Do you remember what weights you used for the holders?

A. That is the base, I should say, or figure. What I did was to take an estimate from my books of a 250,000 foot holder throwing about what the usual pressures are. Then there are different pressures——

Q. This threw 4¾ inches. Isn't that a little more than you reckoned on?

A. I think not. I can estimate that, but the frame I could not give you right off.

Q. Supposing you assumed that the holders were 4¾ inch pressure and that the total weight of the structure of holders, guide frames and connections was 730,000 pounds?

A. For the two or one?

Q. For the two.

A. How much?

Q. 730,000 pounds for the holders, frame and pipe connections?

A. It would figure more than $40,000.

Q. It would figure more than $40,000?

A. Yes.

Q. Mr. Mayer gave an estimate of $52,091. Assuming those weights to be accurate and the pressure as I have stated, would not $52,091 be a fairly low valuation?

A. It would not be low, it would be a fair valuation.

Q. Now, let us refer to the holder with a capacity of 3,250,000 feet which you valued yesterday at $225,000. Did you take into consideration that the tank has a double thickness of plate for a height of fourteen feet from the bottom?

A. It has not a double thickness of plate.

Q. Hasn't it?

A. It is two thicknesses of plate, but it is only the normal thickness.

Q. Well, that is what I referred to, two thicknesses of plate. Does not that increase the cost of labor to construct a tank of that sort?

A. It does, but the tank is not as good as if it were one thickness.

4159 Q. But I am asking for the reproduction of this particular tank?

A. It certainly would, it would increase the cost, but it is no benefit to the tank, it is a detriment.

Q. What weight did you assume?

A. I did not assume any weight, at all, because I would not reproduce a tank like that.

Q. No, but——

A. And there are other things besides that. There is double rivetting that I would not use, and the column supports which extent down are not built according to the present practice.

Q. Assuming that tank were to be reproduced as it is regardless of whether you would not build one like that and that it has 7.2 inches pressure, would you not consider Mr. Mayer's valuation of $262,224 to reproduce that new, as it is, a fair figure?

A. I would call that a fair figure for this reproduction, but would call it bad practice to reproduce it.

Q. Forty-second Street, I think, comes next in order. Referring to the 42nd Street plant now, you gave a valuation of $3,000 for four purifiers 7 feet 6 by 10 feet 6 by 3 feet with four wrought iron covers in connection. Did that include connections and supports?

A. I made these figures in conjunction with someone else. I think they included only the connections from the boxes to the center seals.

Q. Did it include the placing of the boxes in position?

A. Oh, yes, sir.

Q. Have you in mind what weight you gave to the purifiers and covers?

A. No, I have not.

Q. Well, assuming that the weight was, say 59,000 pounds, and that it included only the supports and connections, which you think would you then consider that $3,308 for the reproduction of those purifiers and covers was out of the way?

A. I would consider it about 10 per cent. too high.

4160 Q. Even if you included all the supports and connections?

A. I am taking it, assuming it is 39,000 pounds.

Q. No, 59,000 pounds.

A. No, I would not consider that figure high at all.

Q. You would consider it pretty low, wouldn't you, on the whole?

A. Yes, it is not high.

Q. Under condenser and scrubber house I find your valuation for one cast iron box 7 feet 6 inches by 5 feet 6 inches by 9 feet at $450. What weight did you assume there?

A. For what?

Q. For this box.

A. Which are you referring to now?

Q. Condenser and scrubber house.

A. What are the dimensions, 18 feet diameter by 18 feet high?

Q. No, I am not referring to the scrubbers at all. I am referring to the last item, one cast iron box, 7 feet 6 by 5 feet 6 by 9 feet deep, which I think you valued at $450.

A. That is right.

Q. What weight did you assume for that box?

A. 9,000 pounds.

Q. If the weight were, say, 14,000 pounds?

A. It would be worth about $700.

Q. Will you refer now to the oil and tar store tanks, two wrought iron tanks 9 feet in diameter by 30 feet long, you fixed a valuation of $1,680 and assumed a 5/16th inch shell. What weight did you assume for those two tanks?

A. 28,000 pounds.

Q. 28,000 pounds.

A. For each.

Q. And how much for the eight wrought iron tanks?

A. 80,000 pounds.

Q. And how much for the one wrought iron tank following that?

A. 34,000 pounds.

Q. And how much for the wrought iron tank following that, 5 feet diameter by 25 feet long?

A. 5,500 pounds.

Q. What is the price per pound which you assumed?

A. Six cents.

4161 Q. Can you tell me how that 6 cents was divided up?

A. How do you mean, divided up?

Q. I mean how much for material and how much for labor and how much for setting, or did not this include setting in the case of these tanks, or delivery only?

A. That would include putting them in place for the large ones; not for the small ones.

Q. Can you give me the d[illegible]s in the same way Mr. Mayer testified, showing what proportion [illegible] the price per pound you assigned for labor, or have not you done that?

A. Not now. I could do it.

Q. Did you figure it out in taking this six cents, or take a general figure?

A. I took a general figure; we are constantly building these things, and all we separate is so many pounds of material at so much a pound, so many day's labor, total so much, at such a rate per day, and add the two together and tack on our profit. And the practice we have to-day, and we are building lots of tanks now to-day, is at that rate of 6 cents a pound. I give that from experience. It gives a profitable remuneration on those tanks.

Q. You could divide it up as Mr. Mayer did?

A. Of course.

Q. I would like to have you do so at recess, if you have time.

A. That is a matter of days to get that together.

Mr. PAGE: But have not you at your works that computation?

The WITNESS: At our works it is largely, so to speak, a matter of experience. For instance, last year we were building tanks for 5 cents a pound and glad to get them, and then when they fixed an extra price on iron, we have to add on a little more, and we add just as much as we think they will stand without losing the job. To-day it is 6 cents a pound.

4162 Q. But when it gets down you cut your price?

A. Yes, we have to cut them down, but of course we have to have a figure below which it would be unsafe to go; but I would not undertake to go into that as fully as Mr. Mayer has. It would be a matter of days to get that; you would have to take a number of different ones; for instance, while I have taken the same rate for this 5 by 25 foot tank per pound, there would be less money in it for us than there would be in the bigger ones at the same rate. Some of this tank work I have taken, for instance, all the way through at 6 cents. Some of it I would be very glad to build for less than that and some I would want more.

Q. Is there any difference in the expense of erecting a tank in a holder in the ground as compared with erecting it above ground?

A. Certainly.

Q. Which is the more expensive?

A. Building it in a hole.

Q. Assuming that these two tanks weighed, say, 30,750 pounds instead of 28,000 pounds?

A. They would be worth $845.

Q. Supposing the eight tanks weighed about 90,000 pounds instead of 80,000 pounds?

A. They would be worth $5,400.

Q. And if the one tank weighs 48,000 pounds instead of 34,000 pounds?

A. It would be $2,880.

Q. The same way as to the last tank to which I have referred, the five-foot tank, 25 feet long, supposing that weighed 6,500 pounds instead of 5,500?

A. It would be worth $390.

Q. That is on your basic figure of 6 cents a pound?

A. Yes.

Q. Have you based your estimate of 6 cents a pound to cover all kinds of tanks on the average on New York labor conditions as they exist to-day?

A. Yes, sir.

4163 Mr. MATHEWSON: I think we might suspend at this point.

The MASTER: How long will you take after luncheon, Mr. Mathewson?

Mr. Mathewson: I do not think I shall take over half an hour with the witness.

Recess until 2:00 P. M.

After Recess.

William J. Logan, resumes the stand and further testifies.

Cross-examination continued by Mr. Mathewson:

Q. We will take up 44th Street next. Were your figures for scrubbers for sidewalk delivery or for scrubbers placed in position?

A. Scrubbers placed in position. That refers to all the scrubbers, I presume?

Q. Yes, at all the stations?

A. At all the stations.

Q. It does not, however, include the foundation for the apparatus?

A. It does not.

Q. And it does not include foundation in the case of any of the apparatus to which you have testified?

A. In no case.

Q. Neither at this station nor at the other stations to which you have testified?

A. There are no foundations in any of the prices I have given.

Q. And no connections?

A. To a limited extent the connections to the outside, in the usual way; such connections as apply are immediately attached to the apparatus itself outside, so to speak, in a general way—outside of the immediate apparatus itself. In the holders that would be the inlets and outlets to the drips, all the foundations and the other
4164 apparatus. Take a scrubber for instance, that takes only the
flanges, no connections beyond that, and the same applies to the gas tanks and all that—I do not mean gas tanks, I mean tanks—simply includes flanges and so on to make connections.

Q. And other connections than these which you have mentioned, which are really part of the apparatus used, you have not included in your figures?

A. Well, it has been designated as other connections. In no sense have I——

Q. What price per pound did you take in estimating scrubbers at the various stations?

A. I think six cents, except where—I cannot go all over them.

Q. No, but take the 44th Street station, for instance; the two scrubbers there, which you place at $3,600; how much per pound?

A. Six cents.

Q. And six cents includes both the material and labor?

A. It does.

Q. Taking the two rectangular condensers, 30 feet by 6 feet 6, which you estimated at $28,000, what price per pound did you assume there as a unit?

A. At 44th Street, I don't really know on what that was based. This figure was made on those condensers with all the tubes, and I think I assumed about the number of tubes that would be in there; probably wrought iron.

Q. You did not examine specifically to determine the number of tubes?

A. No, I could not tell anyhow. The condensers are closed so you could not see them.

Q. Do you remember what weight you assumed for those condensers?

A. My recollections is—I may be wrong about that—it was the same base price, six cents a pound.

Q. Did this include the setting?

A. Erecting in position, yes.

4165 Q. Isn't the material in condensers more expensive than the corresponding material in the scrubbers?

A. You mean the wrought iron tubes?

Q. Yes.

A. I think it is.

Q. Didn't you then allow, and are you sure you did not allow a higher price per pound for the condensers than you did for the scrubbers?

A. I remember that I took the price per foot in making this—I had to estimate about how many tubes there would be in there, in the regular way, and I knew about the price of tubes.

Q. Well, assuming that the entire weight of condensers would figure out say, 375,000 pounds?

A. Including tubes?

Q. Yes; 375,000 pounds; in that event Mr. Mayer's estimate of $31,752 to reproduce the two condensers new would be fair, would it not?

A. At 375,000 pounds?

Q. Yes.

A. At sixe cents a pound that would be—well, it might or might not, I would not be able to tell that without making the figures. I would not call it absolutely excessive.

Q. Do you remember whether you took the same price per pound in estimating the value of the air and salt water condensers at this plant?

A. The value of estimating the salt water condensers, I put in at exactly what I furnished them, and in looking over the price compared with to-day thought it was fair. I would be glad to have a contract at the same price to build them to-day. I would like to duplicate them at that.

Q. And you did not figure at the price per pound in this connection?

A. Oh, yes, I figured the price per pound. I looked at it and compared with the rates we pay to-day and it seemed to me fair and equitable.

Q. Do you remember what the price per pound was?

A. The highest price was eight cents.

4166 Q. And I assume——

A. No, I am wrong. I remember in the elbows that went over the arch, that join the two together, the price was 10, but that was a small part of it.

Q. And in all the other stations, in valuing similar apparatus, I assume you took the same price per pound?

A. Well, there is only one other station that uses the same apparatus as you are now speaking of, and that is 99th Street; and the most we had in our estimate there was eight cents.

Q. Referring to the contents of "Water tower" one 20-foot diameter by 20-foot tank, ⅜-inch and ¼-inch steel, Mr. Mayer's estimate of the new is $1,333, and he gives a little lower figure after taking off depreciation. Would you consider that his figure for a reproduction of that tank new was out of the way?

A. And his estimate is how much?

Q. $1,333.

A. I would consider that as no more than an ordinary difference in estimating.

Q. Did you estimate any weight there in determining your value?

A. Oh, yes.

Q. What was the weight?

A. Well, I have forgotten. Roughly, 20 feet in diameter would be 315 feet in the bottom, a little under that, and the sides would be 63½ by 20, which would be 1,270, and 315, call that roughly 1,600 feet, and average it all the way through at 5/16 would be 20,000 pounds and at six cents a pound it would be $1,200.

Q. And if the weight was more than 20,000 pounds I suppose the value would be correspondingly greater?

A. It would.

Q. Referring to the "pump house," two oil tanks, No. 6 and No. 9.

A. Where does that come after this last which we had?

Q. Oh, that it quite a distance on. It is under the heading "pump house, oil tanks."

A. I have it.

Q. You assume them to be ⅝?

A. 5/16.

4167 Q. 5/16 thick?

A. Yes, sir.

Q. And you figured that on the stand I think this morning, your valuation of $5,400, did you not?

A. I am not sure.

Q. Did you assume a weight there?

A. I think I did.

Q. What weight?

A. Well, the area of the bottom, 1,258 feet, the area of the side would be roughly 2,000 feet, that would be roughly 3,300 with 10 per cent. allowance, would be roughly 3,600, at twelve and a half pounds, would be 45,000 pounds.

Q. For the two tanks or for one?

A. For the one tank.

Q. That would mean only 90,000 pounds for the two tanks.

A. Then you have got to put in angle irons and so on at six cents, which would be $5,400. What did I give it as?

Q. $5,400. But don't you think you have underestimated the weight there?

A. I will take the contract for it at that price if it averages 5/16.

Q. If it averages 5/16?

A. Yes.

Q. Well, as a matter of fact, if, instead of weighing 90,000 pounds, there are 150,000 pounds of weight there, of course that would increase your $5,400 very materially, wouldn't it?

A. If the weight is how much you say?

Q. Well, take 156,000 pounds.

A. If they weighed 156,000 pounds they have got more metal than I would consider they need. If it weighs 154,000 pounds at 6 cents a pound, it is worth $9,240.

Q. Do you allow for a top on the tank in your estimate of weight?

A. I didn't, but the top is usually made light.

Q. Did you allow for laps and rivets?

A. I did; 10 per cent.

Q. Well, if the weight was 156,000 pounds Mr. Mayer's figure of $9,750 might be exact?

4168 A. Might be exact. If the weight is that it is not out of the way.

Q. Now, taking the three-story tar tanks under the heading of "Storage Tar Tanks," you have a value under there of $1,320, to wit: $750——

A. For the three rectangular tanks?

Q. For the three rectangular tanks, and $570 for the fuel oil tanks?

A. That is right.

Q. Making six, all told?

A. That's right.

Q. You estimated that, assuming that the thickness was one-quarter inch, I understood you?

A. I did.

Q. Well, if the weights were nearly 26,000 pounds for the three tar tanks and say 3,700 for the fuel oil tanks, Mr. Mayer's figures of $1,613——

A. They are more than that here, sir; $1,756.

Q. No, that includes another item of "tanks and building rest on wooden structure." No, I think you are right. Mr. Mayer's figures of $1,756 wouldn't be out of the way, would they, say for 25,800 pounds and 3,750 pounds?

A. That would be 62,000 pounds roughly. There is something wrong about that.

Q. No, that would not be 62,000, it would be about 29,000. They would not be out of the way, would it?

A. No, it would not.

Q. So, too, in the steel tanks to which you testified under "Oil and pump house," three of them, two 12 by 7 and one 10 by 7 where you gave a valuation of $850?

A. That's right.

Q. What would be the value of those or would Mr. Mayer's valuation be out of the way, $1,218 new, provided they weighed say 19,500 pounds?

A. It would be a little high.

Q. What would you have it?

A. $1,140.

Q. Proceeding to the holders, I direct your attention to the two holders of 125,000 cubic feet capacity, 72 feet 6 inches outer diameter, including the eight round columns. Do you remember 4169 what weight you assumed for those holders and columns?

A. I would not want to say right now. I would say roughly I have estimated more weight, but take that at eight cents a pound it would be in the neighborhood of 450,000 pounds for the two. I must have assumed greater weight.

Q. Do I understand in that weight you did not include any connections except those immediately pertinent?

A. Inlets and outlets, everything out to the drip.

Q. Now, we will take up 21st Street. In the boiler house for two locomotives 60 H. P., Mr. Mayer makes the estimated cost new $2,710 and by taking off some depreciation reduces it to $2,440 as the present value. Would not Mr. Mayer's figures for the original cost new be a fair one?

A. I think it a little high. You can build a locomotive, 60-horse power, and it would cost more than that, but you can build one for less. That is based on general experience. I have made no figures. This particular thing I would not want to say. The boilers may be worth to reproduce to-day what Mr. Mayer figures them but I would say you could build them cheaper.

Q. You think you could build boilers that would do the work for the figure that you gave, which was $2,440, which you set down here?

A. I say it is not out of the way.

Q. Do you manufacture wooden tanks?

A. No, but I get in competition with them a great deal and sometimes order them.

Q. I see you have estimated this wooden tank at only $200 and Mr. Mayer at $360—octagonal valve house, one 7-foot by 7-foot round wooden tank?

A. Yes. I made out the estimate with the area of the bottom to be forty feet and the area of the sides to be 22 by 7, which gives 154 plus 40, which is 194, and 10 per cent. to it would be, 4170 roughly speaking, 210; one-quarter inch stuff, 2,100 pounds, angle iron around top another 110, that would be 2,210 at six cents a pound, $132.

Q. Why one-quarter-inch?

A. It would serve the purpose.

Q. We are talking about a round wooden tank?

A. I mean in competition with those things, in my experience, that a wooden tank, a small one, is about the same price as iron.

Q. But you have never manufactured them yourself?

A. I never have.

Q. You did not critically examine this wooden tank?

A. I did not. The wear and tear on a wooden tank, however, is greater than it is on an iron one; they do not last.

Q. Do you know whether that was a tank for a gas holder or not?

A. I do not. I don't know that I saw it even.

Q. Now, let us go to the "retort house" on 22d Street, and take the three salt water condensers which you figured at a value this morning of $70,000. What figure did you take as your unit value for material and labor?

A. My recollection is five cents a pound.

Q. Do you remember what weight you assumed for it here?

A. Under the circumstances that would be 1,400,000 pounds.

Q. If, as a matter of fact, the condensers weigh 1,875,000 pounds or more than Mr. Mayer's figure——

A. It would be $93,500.

Q. The same as the one similar condenser partly completed which you put at $23,333 as against $30,700?

A. I don't think I put the price on it. I said if the three were worth $70,000 why the other one would be worth one-third, which would be $23,333.

Q. And if it were corresponding to the heavier weight the last one would be worth the $30,700 Mr. Mayer testified?

A. It would be.

4171 Q. Under the "pump house" you give the two wrought iron tanks 8 feet by 12 feet at $520, assuming a one-quarter shell?

A. Yes.

Q. Do you remember what weight you assumed in computing that?

A. I cannot tell. There would be 50 feet in the bottom, 300 feet in the sides which is 350, 10 per cent. of that making 380, and then with the angle iron and so forth it would be 4,000 pounds roughly, at 6 cents, which would be $240. I must have added some more.

Q. Supposing the weight of those two tanks was 9,600 pounds?

A. Worth $576.

Q. Taking the unit figure at 6 cents per pound?

A. Six cents per pound.

Q. And the two wrought iron tanks below, 6 feet by 10?

A. The capacity of them is 4,500 gallons, that is rough. Fifty feet makes 375 gallons a foot, at 12 makes 4,500. That is the capacity for 10 feet high.

Q. Well, whatever the capacity, assuming the weight of those tanks was about 5,400 pounds, then the estimate of $300 would be raised?

A. $324 apiece for 5,400 pounds; $648 for the two.

Q. Now, turn to the holders at this station and take the four holders, each 400,000 feet capacity; what pressure did you assume in your estimate of $182,000 as the value of the four?

A. I don't remember, but I should imagine from the figures here somewhere in the neighborhood of 7½.

Q. It would raise your figures if the pressure was actually 8.7?

A. It would. That is assuming I based it on that. I am not sure as to what that basis was.

Q. Do you remember what weight you estimated for the holders with inlet and outlet pipes and columns, the entire structure of the four?

A. I should say roughly 2,600,000 pounds.

Q. 2,600,000 pounds?

A. Yes.

4172 Q. Well, assuming that the pressure in these holders for gas inflation is 8.7 inches and that the total weight of the holders, guide frames, connections, would be over three million pounds; in that event Mr. Mayer's valuation of $219,400 to reproduce new would not be out of the way, would it?

A. It would not.

Q. The 99th Street plant we will take next. "Condenser and Scrubber House," you valued two 10-foot by 24-foot scrubbers and two 24-foot three by 5-foot 2 by 15-foot condensers with 3-inch vertical tubes in sides of same and the total estimate you made was $18,000?

A. That's right.

Q. You did not assume the same value for the condensers per pound of weight that you did for the scrubbers, did you?

A. The cost would be increased by the cost of tubes. I had a list that I had made at the time and figured up approximately on what I think the number of feet of tubes would be at the market price with the profit on and added, that would be a little bit more than six cents a pound; that is, I mean for the total it would be more than six——

Q. Do you remember what weight you assumed in the scrubbers?

A. What price did I have on the scrubbers?

Q. With the scrubbers and condensers, together, $18,000?

A. What weight I assumed on the scrubbers?

Q. Yes.

A. I don't know. I can rough it.

Q. Or in the condensers?

A. I do not.

Q. Did you figure on cast iron or steel in the condensers?

A. I don't remember.

Q. It would make a difference, wouldn't it?

A. It would be cheaper for cast iron per pound than wrought iron.

Q. Or steel?

A. Well, I mean steel when I say wrought, as we don't use any wrought iron.

4173 Q. Well, if the scrubbers had 68,000 pounds of material and the condensers, say, 320,000 pounds, then Mr. Mayer's figures, of course, new, $20,100, without depreciation, would not be out of the way, would it?

A. 68,000 at six cents would be $4,080, and the other is how much?

Q. Say, 320,000 pounds?

A. No. It would not be out of the way.

Q. Now, in the "yard," three storage tanks, which you figure at $720. Do you remember what weight you assumed for those?

A. I do not. There are 8 by 8, sixty-four times five, 320, 10 per cent. for laps and rivets would be roughly 350; ten pounds to the foot, bringing it up to 3,500; the angle iron around the top would be 280, would bring it up to nearly 3,900 pounds, at six cents a pound, would be $234.

Q. For one?

A. That is for one.

Q. Now, supposing the three to weigh 12,000 pounds?

A. Then they weigh more than they ought to.

Q. Supposing they did weigh that?

A. Then they are worth $720.

Q. $720, as the value?

A. 12,000 at six cents a pound is $720.

Q. How about the twelve steel tanks below, supposing them to weigh 240,000 pounds, what would be the value?

A. $14,400.

Q. Did you assume that they did weigh that in getting $14,000?

A. I did. I based all those on six cents.

Q. Do you remember what weight you assumed in the two oil storage tanks just below which you valued at $2,600?

A. I assumed 60,000 pounds.

Q. Turn now to the holders and tell me again what value you placed upon those two 600,000 cubic foot holders with three lifts?

A. $70,000.

4174 Q. Do you mean for the two?

A. Yes.

Q. What pressure did you assume?

A. I fancy I assumed in the neighborhood of 7½ to 8 inches.

Q. What weight did you assume for the entire construction, holders, lifts, columns, as specified?

A. Roughly speaking I should say somewhere in the neighborhood of a million pounds.

Q. A million pounds each?

A. No. Both.

Q. Won't you reflect a moment and see whether you included one million only for the weight of the two three lift holders, including the lifts and the columns? Isn't there a mistake somewhere there?

A. I say I assumed that by dividing by 7, taking that as an average price.

Q. Didn't you assume a two lift instead of a three lift in your computation?

A. I have forgotten just now how that was made out, whether made for two or for three lifts, if it was figured on the weight. I am taking the lump sum I figured and divided by 7 so as to get about—this is a matter I cannot recall in a minute.

Q. I ask you particularly because you are very far from Mr. Mayer's evidence as to these holders and very near his evidence in almost all the others, and I thought there must be some discrepancy that was not visible?

A. You mean with regard to the weight?

Q. No, I mean as to value. Mr. Mayer's testimony was $59,674 for each holder, and yours is only $70,000 for the two. Now, let us see——

A. Wait a moment. I want to carry out on that. Mr. Mayer's estimate is $59,674 for each holder?

Q. For each holder. Now, let me see if you have the description right. Two holders, 600,000 cubic feet each, three lifts, diameter of outer centres 100 feet, second section 98 feet 6 inner section 97 feet; height of lift 27 feet 6 inches, 16 wrought iron 4175 column centres. Now, won't you compute that?

A. Can Mr. Mayer tell me what pressure that holder throws?

Q. 7.2 inches.

A. You say there is a wide discrepancy. I will just figure it roughly; 7,854 feet in the bottom; 7.2 at 5.2 roughly would be about 37 pounds per inch—and call it 8,000 instead of 7,850, would be $29,600 for the holder alone. And then the frame, roughly speaking, would be about one-third of the cost, $9,900 more; and then the inlets and outlets roughly would be in the neighborhood of $2,000. That would bring it up to $41,500. I do not think my figure is much out of the way at $70,000.

Q. Assuming that the weight of one of these holders with its guide frames and connections, including all the connections and not merely those which you have in mind was 820,000 pounds?

A. One of them?

Q. Yes. Then the value would not be out of the way at $59,674, would it?

A. I think it would be high.

Q. Even at that weight?

A. Yes. I would be very glad indeed to build them for 7 cents a pound. It would not be worth much more.

Q. How do you assume that the guide frame is one-third the weight of the holder?

A. I only guessed that—I did not say one-third the weight.

Q. One-third the price I should have said.

A. I said one-third the price, because we do not figure that at the same price we do the other.

Q. Is not sixteen columns more than the normal for a 100-foot diameter holder?

A. Yes, it is.

Q. And that would account for considerable weight, would it not?

A. Yes, it would.

Q. 18th Street, referring to the two holders at this 18th 4176 Street station, capacity 205,000 cubic feet each with two lifts, what weight did you assume in estimating the value at $19,000?

A. I did not estimate any weight at all. I took from our estimate books—or rather in this I took the same rough figuring I had done and afterwards verified it by our estimate book by a holder of 200,000 feet capacity that we bid for, and took the holder out of it and then added for the tracks and the columns and the tank iron work, inlet and outlets.

Q. But you did not estimate on this particular holder otherwise than by comparison?

A. These original figures I thought I had too low, and so I compared—this was after this thing was brought to me. As I have said many times before, I did not have much time on it and I looked and found it was not far out of the way.

Q. What pressure did you assume?

A. I have forgotten, but I should say roughly in the neighborhood of 3¾ to 4 inches.

Q. Assuming that the pressure was 5 to 5 1-5 inches?

A. It would be worth more money.

Q. And assume that the weight of the entire construction of the two holders, was, say, 395,000 pounds?

A. 395,000 pounds?

Q. Yes, in that event with that pressure would not they be worth $29,800 to reproduce new?

A. No, I do not think so. At an average of 7 cents, which is about what I would be willing to do it for, and call it instead of 395,000 pounds 400,000 pounds, it would be $28,000. That is over rather than under what I would bid for them to-day, taking it all together.

Q. Take the four holders below, each 255,000 cubic feet capacity, will you tell me what pressure you assume there and what weight you assumed for the four holders?

A. My recollection is somewhere in the neighborhood of 4 inches; I am not sure about that, but I can tell you later just exactly what was figured on. 4177

Q. Assuming that the pressure was 4.8 and the weight of those four holders was over 370,000 pounds apiece, and you assume 7 cents as the——

A. It would be $25,900 or $103,600 for the whole.

Q. That would be very close to Mr. Mayer's figure of $105,378?

A. I have no figure on his.

Q. But if that be his figure?

A. I do not think it would be out of the way.

Q. So, too, if you took the other holders, the previous two holders of 105,000 cubic feet capacity at 395,000 pounds in weight, with their frames and connections, that would give a value at 7 cents per pound of——

A. $27,650.

Q. Would it not be a little more than that?

A. No.

Q. You say that it is not the custom now to cover gas holders with buildings. You know that it was the custom at one time or frequent practice to do so?

A. It was the frequent practice.

Q. And was considered at that time good engineering?

A. I assume so or it would not have been done.

Q. So, too, while you say that a large holder, holding a million cubic feet, can be built for less than four holders holding 250,000 feet each, you find as a general rule, that gas companies that have been built up and have been increasing their consumption in the past have a great many small holders on their hands, don't you?

A. Yes.

Q. At 65th Street the two holders, Nos. 1 and 2, 325,000 cubic feet capacity each with two lifts, you estimate at $52,000. I assume that you took there also the 7 cents per pound as your unit figure, didn't you?

A. I would have to assume the same thing.

4178 Q. And do you know what weight you assumed for the two holders with their frames and connections so far as you included connections?

A. It would be somewhere in the neighborhood of 735,000 pounds.

Q. Supposing the weight of the entire construction was 805,500 pounds?

A. It would be $56,350—500 pounds did you say?

Q. 805,500 pounds.

A. $56,350.

Q. In that event Mr. Mayer's estimate of $57,197 would hardly be out of the way substantially, would it?

A. No.

Mr. Page: In other words, if you assume the same figure as Mr. Mayer does and use the same multiplier, you would produce the same result?

Mr. Mathewson: I wanted to see if our mathematics were good.

Q. 111th Street. The contents of yard, oil tank 43 feet by 20 feet, which you estimate at $2,200 to reproduce, what weight did you assume in that tank?

A. Well, I fancy somewhere in the neighborhood of 35,000 or 36,000 pounds; 36,000 pounds would be $2,160.

Q. Did you figure that with the top on the tank?

A. I am not sure. I do not remember.

Q. You don't remember that any top was included do you?

A. I don't remember; if there was not, there should have been.

Q. Well, do you remember what unit figure you assumed there as the price per pound?

A. Six cents.

Q. Take the atmospheric condensers of cast iron pipe filling 30 inches diameter in ten sections with cast iron base, what unit price did you assume there?

A. My recollection is 5 cents, but I am not sure.

4179 Q. Do you remember what weight you estimated?

A. There would be 80,000 pounds.

Q. And, of course, if your weights are too low, the estimates should be correspondingly raised?

A. Certainly.

Q. 132d Street, one holder, 5,000,000 cubic feet capacity, did you take 6 cents there as the base?

A. No, I just roughed that; that would have taken too much time to estimate it. I based that estimate on the cost of the holder which we built at 21st Street, which cost a little over $40 a thousand and I assumed—it is above $40 a thousand, and I figured with the increase in material and increase in labor that about $60 a thousand would be about the right price of it, and I took $60 for 5,000,000 feet and called it $300,000.

Q. Do you know how much pressure that holder throws?

A. I don't, but I would assume somewhere in the neighborhood of 13½ or 14 inches.

Q. Assume it throws 15.4 inches, that would raise the price a little?

A. Not on my figures. I have margin enough to take care of that.

Q. Did you assume any special weights for that?

A. No, I did not. I will say that I would be very glad indeed to take a contract for it at my figures.

Q. Including the connections which you have defined?

A. I have added them on there I think, $322,000 is my total.

Q. $325,000, is it not?

A. $322,000.

Q. The next and last is the Inwood station. You referred at once place to apparatus that was not in use. Do you remember what that was?

A. Well——

Q. Was it a hydrogen scrubber?

A. I think so, I think that was referred to as not being in use.

Q. It was being repaired, was it not, when you saw it?

A. I do not call to mind. I would not pretend to remember accurately each and every one of those things in that schedule.

4180 Q. You said that it seemed to you or that you thought it was out of use; were you not informed that it was in use as an oil scrubber?

A. If so, I have forgotten.

Q. And was merely under repair.

A. If so, I have forgotten.

Q. You had not any personal knowledge, of course, as to what use it may be put to or is being put to?

A. No.

Q. Now, referring to this various apparatus respecting which I have questioned you, I understand that your examination of it was not one of great care, was it, of the individual items of apparatus?

A. Well——

Q. You did not go through the works and examine carefully each item of apparatus, did you, respecting which I have just questioned you?

A. I think I saw each item. I would not——

Q. But you did not measure the thickness of the shells and the thickness——

A. I did not measure the thickness of anything.

Q. And your views as to weights are based upon your general estimates and not upon specific measurements, so far as that goes?

A. Largely so.

Q. You said in your direct-examination that someone assisted you in marking these figures. Who was your assistant, Mr. Logan, or who acted with you?

A. Mr. David Leavitt Hough.

Q. Did you ever know a holder to be taken out because it had actually rusted out and become worthless?

A. I have heard of such things.

Q. Did you ever know one in your own experience?

A. I have seen stuff that had been a holder that was all rusted out.

Q. You have never had occasion to move one that was all rusted out?

A. I have never had occasion to move one and found it was rusted out.

4181 Q. I mean, of course, where a holder has been continuously in use and taken care of and not abandoned?

A. I am not old enough to know what the life of a holder would be for coal gas, if it was taken care of on the outside. If you let it go without painting and taking care of it, it will rust out.

Q. But the depreciation, from the outside, if it is not taken care of——

A. But the depreciation comes from the outside and if it is taken care of—it is good for I don't know how long.

Q. So far as your observation goes, for an indefinite time?

A. Older than I am, there are holders in use older than I am.

Q. The 5 per cent. which Mr. Mayer added was 5 per cent. interest on the money involved in the construction of the entire plant, both manufacturing, holders and otherwise; you would not expect plants like those of the Consolidated Gas Company, including the manufacturing plants, as well as the holders, could be reproduced under two years, would you?

A. Some of the plants, I think, could be reproduced under two years.

Q. You think the entire plant could be?

A. No, it could not be reproduced in that time even.

Q. So that if you are considering the entire plant, half of two years' period would not be excessive, would it?

A. Considering the entire plant, no.

Q. Is it not true even in holders that the time required to get the tanks ready, to construct the tanks, the foundations, etc., frequently exceeds the time required for the construction of the holder itself, in your experience?

A. You cannot practically do any work in erecting the tank until the foundation is completed.

Q. And the laying of the foundation is a matter sometimes of great difficulty?

A. Sometimes great difficulty——

4182 Q. And a long period——

A. One moment. There are lots of foundations on which we have erected tanks where they did not commence the erecting of the foundation until we had commenced getting the work ready in the shop.

Q. And sometimes it is the other way?

A. And sometimes it is the other way.

Q. You said that no engineering charge was to be added to the figures that you have given. You mean no engineering charge as far as your concern is concerned, don't you?

A. That is what I mean, but I do not see how the gas company can be put to any expense for engineering charges if they approve of the plans that are submitted by me, except the inspection and supervision of the work while it is going on.

Q. You have never been in the gas business, have you, Mr. Logan, operating a gas plant?

A. No.

Q. And do you know that company constructing a plant has to lay out plans to supervise the work and to arrange for drainage, to make sewer connections and various other things which add the percentage in final cost of plant to the actual amount paid to the contractors who actually put up material and apparatus, don't you?

A. If they design and do all that preliminary work that you say, there is a cost on the part of the gas company for it.

Q. An engineering expense on the part of the gas company?

A. Yes.

Q. And what that would be or the proper amount for them to charge you have not had experience of, practically?

A. In a general way I would say that in a construction, this is my comparison, that is all——

Q. I am not asking you for your opinion. I say you have never had experience in a gas works so that you are able to say?

4183 The MASTER: He has already said that.

Mr. MATHEWSON: I have nothing further.

Redirect examination by Mr. PAGE:

Q. While you have never had the experience of running a gas works as a gas engineer, you have been a director of gas companies for a good many years, have you not?

A. I was director of the Williamsburg Gas Company for, I think, three years, and the Brooklyn Citizens Company for perhaps two years.

Q. And in connection with your business of supplying certain portions of gas plants, you have had a good deal to do with being around a gas plant and constructing it when the gas plant has been in course of construction, have you not?

A. Yes.

Q. And you are still quite largely interested, if not a director, in gas companies?

A. I am interested; I would not say largely.

Q. Of course, that is a relative term. The weights that were given by you in your direct examination upon these various apparatus, holders, tanks and so forth, are the weights that you have found in your manufacture of gas apparatus, that such apparatus weighs, are they not?

A. Based on what I thought would be satisfactory for the purpose.

Q. The weight of this apparatus has been computed by you and not assumed, has it not?

A. With the exception of the tar scrubbers, I assumed that from their weight.

Q. Where they gave the weight you assumed the weight.

A. Yes.

Q. But all the other weights that you have given here have been a matter of computation?

A. In a rough way, yes, sir.

4184 Q. That that has been made here has been in a rough way, but you did prepare, did you not, and give to Mr. Hough, who has been spoken of here, your estimate upon this portion of the plant which you have valued here to-day?

A. That and others besides.

Q. In that you made the detailed calculation?

A. I did.

Q. And that is not available to you at present?

A. It is not. The details were all destroyed when we were through with them. We checked up one with the other and they were destroyed.

Q. Now, as I understand, neither you nor Mr. Mayer have weighed this apparatus?

Mr. Mathewson: How does he know about Mr. Mayer?

Mr. Page: Mr. Mayer has testified that he did not and that his arrival at weights was a matter merely of computation, in answer to a question asked by me.

Q. Now, your computations have been based upon your actual experience?

A. They have.

Q. In the manufacture of various apparatus?

A. They have.

Q. And the weights that you have given are such as are used by you for those various apparatus?

A. They are.

Q. And if Mr. Mayer would make a mistake in the calculation of the capacity of a tank by one-half, you would prefer to rely upon your own calculations, would you not, as to the weight of the apparatus?

Mr. Mathewson: I object to that. I don't think there is any such testimony.

The Master: I will allow it.

Mr. Mathewson: Exception.

4185 A. Decidedly so.

Q. And where the thickness of the apparatus has been given in the schedule furnished by Mr. Mayer, you have taken that thickness, have you not?

A. I have.

Q. As I understand, in estimating the values of your holders and tanks you have estimated connections except those that are known as yard connections, is that right?

A. I have estimated all except the yard connections; the immediate connections to the tanks I have estimated.

Q. And the yard connections were separately estimated by Mr. Mayer in the schedule that he furnished you, were they not?

A. They seem to be; that is, in those schedules they are specified.

Q. That is, there are yard connections specified in those schedules?

A. There are.

Q. Now, when Mr. Mathewson has asked you to assume certain weights and compute your price upon those weights as assumed and you have stated that if those weights were correct Mr. Mayer's figure was not out of the way, were the weights given by Mr. Mathewson such as actually obtained in the manufacture of the particular article that he was questioning you about?

A. As a general statement, I would say no.

Q. Well, the question was general. At one of the stations there is a double tank construction for a holder. Do you remember which station it is?

A. The 14th Street station.

Q. Did you ever know of any other gas holder being erected in a tank of that construction?

A. I never did.

Q. If you were called upon to reproduce that plant to-day would you repeat all the errors that have been made in the past?

4186 Mr. Mathewson: What is the use of asking a question of that kind? There is not any evidence that they were at the time they were constructed.

Q. Is such construction a practical construction, having a double tank?

A. When you say double tanks, there are such things as double tanks; this is a tank with double thickness of shell.

Q. Yes, that is what I mean, a tank with double thickness.

A. Is there any? That is the only one I ever knew or heard of.

Q. That is not exactly the question. (Question repeated.)

The Master: Well, it appears to be practical, because it is there.

The Witness: It appears to be practical, because it is there and working.

Q. Well, that does not make it practical.

A. Well, it is there and working. I would not consider it good practice to use it there.

Q. That is what I should have said, good practice, instead of practical. Now, in regard to surrounding your holders with brown stone trimmings, a gas company that would build a tank and holder to-day and surround it with a brick house and spend $155,000 for a house to surround it, would be doing a foolish thing, would they not, in the light of experience?

A. I would think so.

Q. It would be foolish waste of money?

A. I would think so.

Q. And a frame that would surround the holder as built to-day would cost about how much?

A. To cite this particular instance, there would have to be a frame for each one.

Q. I know, but I cite this house that had two holders in it.

A. I would say roughly that the frame work for those two would cost in the neighborhood of $10,000. 4187

Q. That would be sufficient for all practical purposes, that would be the only thing that would have to be added if you removed the house?

A. That is all, for the purpose of using the holder, that would have to be added.

Q. Now, if you were reproducing a plant to-day for the distribution of the gas, 10,000,000,000 cubic feet of gas or 13,000,000,000 cubic feet of gas, you would not build this large number of small holders, would you?

A. I would not.

Q. And you would not say that to rebuild a large number of small holders instead of a few large holders was economical construction, would you?

A. I would not.

Q. And while you have given the prices which it would cost to reproduce those holders to-day, you would not consider that the reproduction of them was a proper thing to do?

A. I would not.

Q. In regard to this hydrogen scrubber which has been somewhat considered in the past, you observed, did you not, that upon the schedule that was given to you it was marked "out of commission"?

A. It had some mark to indicate that it was not being used, I do not remember just the phraseology.

Q. So if it was temporarily being repaired when you were at the works, it must have been temporarily being repaired when Mr. Mayer was at the works?

A. It would seem so.

Mr. Mathewson: This is all argumentative.

Mr. Page: Oh, yes, that is argumentative, but it is not assuming the existence of a fact which does not exist, as your question did.

The Master: As I remember it, when Mr. Mayer was on the stand, there was something said to the effect that that statement meant that it was summer time and in the winter time, 4188 the supply being larger than the summer time, it was not necessary to use this apparatus in the summer time.

Mr. Page: This hydrogen scrubber was at 99th Street, was it not?

Mr. Mathewson: I think that was all gone over, Senator, by somebody who knew about it, and this witness evidently does not know anything about it. It is not worth talking about. It is a little bit of an item.

Mr. Page: No, it is only $1,400.

Q. You spoke about the life of a gas holder that was used in a gas plant. Is there any difference in the life of a gas holder that is used in a water gas plant and one that is used in a coal gas plant?

A. I think there is. There might be.

Q. You think that the life of a holder in a coal gas plant is longer than it would be in a water gas plant?

Mr. **Mathewson**: Just a minute. I do not like to have a question put that way. I think it is pretty leading, and I do not think the witness has said anything to warrant it. I do not think he has had any experience which would warrant such a reply.

The **Master**: Well, it is introductory, I suppose, merely. I will allow it.

Mr. **Mathewson**: I except.

A. I do.

Recross-examination by Mr. **Mathewson**:

4189 Q. Will you explain why a holder used in a water gas plant, if well taken care of, will last a shorter time than a coal gas holder?

A. In a general way I have heard——

Q. Well do you know?

A. Do I know?

Q. Yes.

A. Not from my own personal knowledge, but I have heard in my experience, moving around among some of the gas men, I have heard them say it would not last, I have heard some of them say it was eaten out.

Q. You have not heard of a gas man who has had to dispose of a water gas holder, have you, because it was eaten out inside?

A. I do not recall any at present.

Q. Don't you know that in water gas there is an oil accumulation in the holder which contsantly lubricates the holder as it moves up and down on the lift.

A. I understand that there is oil goes in the inside of the holder; but that it is deposited on the sides, I am not so sure.

Q. If it lies on the top of the water and the holder goes up and down it would be bound, would it not, to accumulate on the sides of the holder?

A. Yes, it would probably act that way.

Q. That would tend in your experience, to protect it, generally speaking?

A. Yes.

Q. Have you ever in your experience known a water gas holder well taken care of, properly cared for from the outside to be abandoned because it had rusted out?

A. I cannot say that I have.

Q. You have been asked as to the building of small holders and so on, and whether you would build small holders to-day. Is it not your experience in all business that hind sight is better than foresight sometimes?

A. It is.

Q. Do you know of any instance in which Mr. Mayer has made a mistake of 50 per cent. in the testimony that he has given?

A. Without going absolutely into details, I would have to say no. He may have made it, however.

4190 Q. Oh, yes, we may have. Of course we are all fallible.

A. There were some figures you gave me on the assumption——

Q. But you do not find in any case that your estimates are 50 per cent. outside of Mr. Mayer's?

A. I do not recall just now. I won't say but may be there may have been.

Q. You found in a great many instances that your estimates were higher than his?

A. I did.

Q. And in a great many other instances that they were very close?

A. Yes.

Q. And in very few instances was there any considerable difference, is not that right?

A. Yes, but I would not want to say as to the 50 per cent. to cover that exactly.

Q. Knowing the cubic contents of steel or iron apparatus, it is easy, is it not, to compute with substantial accuracy the weight?

A. It is.

Q. And if an engineer measures apparatus both as to length and breadth and also as to thickness, his estimate of the weight, assuming that he was able to multiply, would be much more accurate than one who made a general estimate from inspection of the apparatus alone, without thus measuring?

A. A man fortified with all the dimensions should be able to make one more nearly accurate than one without the dimensions.

Q. And except where the dimensions appeared in this schedule which you have had, you did not make any measurements of dimensions?

A. I made absolutely no measurements whatever.

Q. And your estimates of weight where you have used them was merely as to weights which such apparatus might produce, which would take the place of the apparatus which you were valuing?

A. They were made according to general practice for making those such as I have done.

4191 Q. And you know, do you not, that different apparatus manufactured by different manufacturers differs somewhat in weight?

A. Yes, sir, it certainly does.

Q. And that apparatus constructed at one period, say ten years ago, differs from the weight of apparatus manufactured to-day, in some cases?

A. No question about that.

Q. So to get exact weights you would have to measure and also get the length, breadth and thickness of the columns and holders and sizes of the tanks and other apparatus?

A. A man should have those.

Q. And you did not have all those details in your estimates of weight here?

A. I did not have those details on which to base my estimates of weights.

By Mr. PAGE:

Q. But you did in every respect except in some cases as to thickness of the shell, did you not?

A. Those thicknesses where they were given, I used them.

Q. But you had all the other dimensions which were given on the schedule?

A. Where the sizes and thicknesses were given I used them.

By Mr. MATHEWSON:

Q. You had no data as to the thickness of the material in the different scrubbers and condensers had you?

A. I think not. Some of them, there was.

Q. And was it not the exception where you had any thicknesses upon which to compute weight in dealing with apparatus respecting which you have testified?

A. With regard to the bulk, in many of the estimates I have made I would—that is the bulk, so I would say I had nothing to govern me to be pretty close to what was there. I do not want to say 4192 that it was the exception. Where the weights were given, in a great many of those things it is not necessary to know the weight; for instance in the holders, if you have the pressure given we could figure——

Q. But you did not even have the pressure in the holders, did you?

A. No, I did not have the pressure in the holders.

By Mr. PAGE:

Q. But you had before you all the details which Mr. Mayer gave here in his testimony?

A. I had.

JAMES L. WELLS, called as a witness in behalf of the defendant, the State of New York, being duly sworn, testified as follows:

Direct-examination by Mr. PAGE:

Q. Mr. Wells, where do you reside?

A. I reside at 604 Tremont Avenue.

Q. What is your occupation?

A. Real Estate.

Q. In the City of New York?

A. Yes, sir.

Q. Where is your office?

A. 141 Broadway.

Q. How long have you been engaged in the real estate business in the City of New York?

A. Over thirty years, about thirty-three years.

Q. What has been your particular line of business, relating to real estate?

A. I have dealt in real estate generally as an auctioneer, broker and appraiser. I am not a speculator in real estate.

Q. What official positions have you held, Mr. Wells?

A. I have represented the city in various capacities at different times; I have been a member of the city government and the State government; my life has been principally devoted to the real estate business.

4193 Q. Yes, but particularly, you have been President of the Board of Taxation and Assessment, is that what it is called?

A. I was Commissioner in the Department of Taxes and Assessments under the administration of Mayor Strong, and I was President of the Department under the administration of Mayor Low.

Q. For how many years under Mayor Strong's administration were you a member of the Board?

A. Mayor Low was two years, and I was nearly three years under Mayor Strong.

Q. Besides that, I believe you were a member of the Charter Revision Commission, were you not, that revised the Greater New York Charter?

A. I was a member, yes, sir.

Q. Have you examined the various properties of the Consolidated Gas Company shown on Exhibit 48?

A. I have examined all from the map, but I have not yet personally examined all the properties for the purpose of testifying, although I have seen all the properties.

Q. Will you take up first the Block 1643, corner of 116th Street and Lexington Avenue, the southwest corner, have you examined that property?

A. I have.

Q. What is that, vacant property?

A. It is a vacant plot on the southwesterly corner of 116th Street and Lexington Avenue, having a frontage of 80 feet on 116th Street and 100 feet 11 inches on Lexington Avenue.

Q. What is that property worth?

A. In my opinion it is worth $71,000.

Q. How did you arrive at that result?

A. I value the corner 25 feet by 100 feet and 11 inches at $30,000. I value the next lot to the corner at $20,000, the next 4194 lot to that at $17,000, and the remaining five feet at the same proportionate rate, which would be $3,500, making a total of $71,000.

Q. Passing to Block 1642, that is the northwest corner of Third Avenue and 114th Street?

A. It is.

Q. That property has buildings on it, has it not?

A. Yes, almost covered with buildings.

Q. Will you give the dimensions of that as you have it?

A. I have only appraised the land. The northwesterly corner of Third Avenue and 114th Street has a frontage of 25 feet 2¾ inches on Third Avenue and 100 feet on 114th Street. The property on 114th Street adjoining it on the west has a frontage of 50 feet and 5 inches at a depth of 100 feet 11 inches.

Q. Now, what value do you place upon the land?

A. I value the land at $62,500.

Q. Do you make any additional allowance for the value of the lot that adjoins the lot that fronts on Third Avenue?

A. I did not.

Q. Is there any additional value to a lot that abuts on the rear of a corner lot as this does?

A. In many cases there is that additional value, but I do not think so in this case.

Q. And why not in this case, Mr. Wells?

A. It would add additional value if the same owners controlled the frontage on Third Avenue to a point northerly 100 feet 11 inches from the corner of Third Avenue and 114th Street.

Q. There would be an additional value then on account of plottage?

A. On account of plottage, and on account of the availability for improvement, but very little can be done with that corner lot compared to what could be done if there was 50 feet or 100 feet.

Q. Have you examined the property at Irving Place and 15th Street, Block 870?

A. I have.

Q. Did you value the land and buildings there or land only?

A. I only valued the land.

4195 Q. Well, of what does that consist in the way of land?

A. That land consists of a plot 84 feet front on the easterly side of Irving Place and 155 feet 6 inches on the southerly side of East 15th Street.

Q. And what value did you place upon that land?

A. I valued that at $203,854.

Mr. Mathewson: Land only?

The Witness: Land only.

Q. How did you arrive at that valuation?

A. I made an arbitrary division of the land, taking Irving Place as the prominent frontage and dividing the plot up into 25 x 100 foot lots and 9 feet over; I divided the land in the rear on 15th Street into two 25 x 84 foot lots and a lot 5 feet 6 inches by 84 feet, simply for the purpose of ascertaining the value by the uniform measurement of city lots.

Mr. Mathewson: Will you give the valuation of the corner as distinguished from these other lots?

The Witness: I can, yes, sir.

Q. Will you state the valuation which you placed upon the corner lot?

A. I placed a valuation of $60,000 on the corner lot and on the lot next to the corner, $42,500; and the next lot on Irving Place, $40,000, and the next 9 feet at the same rate per lot as the $40,000, which gave me $15,000; I value the lots on East 15th Street at the rate of $22,500, and inasmuch as they were only 84 feet deep I took 92 per cent. of the lots value for 25 feet by 100 feet, so that I had for the first lot on East 15th Street, $20,700, for the next lot $20,700, and for the small strip of 5 feet 6 inches I had $4,554, or in other words I valued the frontage on Irving Place 84 x 100 feet at $157,900, and the frontage in the rear of that on East 15th Street, 55 feet 6 inches at $45,954, making my total of $203,854.

4196 Q. Block 239, which was the corner of Hester and Elizabeth Streets?

A. That lot has a frontage of 100 feet on the northerly side of Hester Street and 150 feet on the easterly side of Elizabeth Street.

Q. And what value did you place upon that?

A. On the whole plot, $142,500.

Mr. Mathewson: Land only in each case?

The Witness: I have not appraised any buildings in any case.

Q. And how do you arrive at that result Mr. Wells?

A. I divide it into 25 by 100 foot lots, facing four of them upon Hester Street and two of them upon Elizabeth Street.

Q. And what values do you give to the separate parcels?

A. I value the corner lot at $37,500, the next lot to the corner at $25,000, and the next two lots at $22,500, and I value the two lots on Elizabeth Street at $17,500 each.

Q. Block 972 is an irregular piece of ground on East 15th Street, west of Avenue B, that is vacant land, is it not?

A. It is. Well, there is an old building of some kind on it; I could not get upon the ground. I could only see the property by looking through the fence.

Q. Will you give the land value of that?

A. My estimate of the value is $22,000, provided it is of the shape shown in the diagram; it does not appear like that shape on the ground, but that may be on account of the fences.

Mr. Mathewson: Yes, that is it, on account of the fences.

The Witness: The fences do not follow the line of the diagram.

4197 Q. Well, you have made your calculations based upon the showing on the diagram?

A. I have.

Q. According to the statement of the Consolidated Gas Company?

A. I have.

Q. Now, you might state how you have arrived at the result of $22,000?

A. That plot has a frontage of 13 feet 3 inches on 15th Street, commencing 300 feet west of Avenue B at a point 313 feet 3 inches the boundary line runs in a diagonal direction southwesterly along the line of old Stuyvesant Street, as it formerly existed, to a point; then it runs south 10 feet 6 inches and then easterly 75 feet 7 inches and then southerly 3 feet 5½ inches, and then easterly again 74 feet 5 inches and then northerly, so the diagram says, 106 feet 8½ inches; but you cannot see that little strip of land 3 feet 5½ inches as shown on that diagram, and it does not show that way on the tax maps; that would appear to encroach on the other lot fronting on 14th Street.

Mr. Mathewson: Perhaps the other lot encroaches upon us, Mr. Wells.

The Witness: That may be. It is very difficult to find out how that line runs in there. I went through the tenement house on 14th Street and got to the rear of it, and I went through the tenement house on 15th Street to see the other portion of it, but there is a tight board fence there and everything——

Q. Assuming the diagram to be correct, as all of our testimony has been based on that assumption, will you state now, how you arrived at the value of $22,000?

A. Well, I took 13 feet 3 inches by 106 feet 8½ inches and I valued that at $53,000; and the balance of the land I compute by the well-known Hoffman rule. It is a long calculation; you 4198 can do it in several ways; you can take it up and divide it into lots or average it; the shortest way is to average the dimensions. It averages about 50 feet south of the southerly line of 15th Street, and I took that portion of the Hoffman rule to estimate it.

Q. Now, Block 985, which runs from 17th to 18th Street, 188 feet west of Avenue C?

A. That has a frontage of 350 feet on the southerly side of East 18th Street and 350 feet on the northerly side of East 17th Street. It is situated 138 feet east of Avenue B; it makes in all 28 lots each 25 by 92 feet, fourteen fronting on each street.

Q. Are those vacant lots or are they used for some purpose?

A. Those are used for gas purposes.

Q. The gas holders, I believe, are on those. And what value do you place upon that plot?

A. I value the lots on 17th Street——

Q. What is the total first?

A. $213,150. I valued the lots on East 17th Street at $7,500 each and the lots on 18th Street, 14 of them, at $7,000, and I add 5 per cent. for plottage.

Q. And Block 982?

A. I have not gone any further with them. The rest of my work is home.

Mr. Page: Then we will have to suspend. Before we adjourn, I want to say that I have subpœnas for the various directors. Will you produce them, or shall we subpœna them?

Mr. Mathewson: What about?

Mr. Burr: Two things, we think they are very essential witnesses for the defense to begin with——

Mr. Mathewson: Do you mean with reference to that newspaper article?

Mr. Burr: Yes, that is one of them, and in regard to franchises and oil.

4199 & 4200 Mr. Mathewson: I cannot conceive any theory on which you can subpœna them or get anything out of them if you do; it seems to me you are wasting your own time or our time. I do not think I can agree to produce them, but if you will give me an idea of what you want, I will submit it to the officers of the company.

Adjourned to Monday, November 26th, 1906, at 10:30 A. M.

4201 Circuit Court of the United States, Southern District of New York.

Consolidated Gas Company of New York, Complainant,
vs.
Julius M. Mayer, as Attorney General of the State of New York; William Travers Jerome, as District Attorney of New York County; Frederick E. Gunnison, John C. Davies, and Lucien L. Shedden, Constituting the New York State Commission of Gas and Electricity, and The City of New York, Defendants.

Before Arthur H. Masten, Special Master.

New York, Monday, *November* 26, 1906.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Page, Mr. Kirby.

4202 James L. Wells resumes the stand and further testifies.

Direct examination continued by Mr. Page:

Q. Did you visit the premises, Block 982, Lots 13, being corner of Avenue C and 14th to 15th Street?

A. I have visited it.

Q. Have you made a valuation or appraisal of the land there?

A. I have made an appraisal of the land.

Q. What price do you set upon it?

A. I value the property at $300,000.

Q. That is used for holders, is it?

A. Yes, sir. There are some brick buildings on it also that I made no estimate of the value of.

Q. Now you may state how you arrived at that result.

A. I valued the lot which is the northwest corner of 14th Street and Avenue C, lot 25x103 feet 3 inches, at $14,500, and the adjoining lot at $10,000. I am facing my lots on 14th Street and not on Avenue C. I value fifteen lots west of this on 14th Street at $9,500 each on the average, which makes $142,500. I have remaining a parcel of land 9 feet 10½ inches in width, 103 feet 3 inches in depth, which I value at the rate of $9,500, and that gives me $3,686. I face four lots on Avenue C, making the corner of 15th Street, and I value the corner, a lot 28 feet 3 inches by 100 feet, at $11,000. Lot fronting on Avenue C, adjoining the corner, I value at $8,500 and the two remaining lots on Avenue C at $8,000 each, making $16,000. I value thirteen lots on East 15th Street at $7,000 each, making $91,000, and the 9 feet and 10½ inches remaining at the rate of $7,000 a lot, which is $2,753. That makes a total of $299,939, and I call it $300,000.

Q. Now we will take Block 989, lot 1, which is between
4203 15th and 16th Streets, on the east side of Avenue C.

A. Block 989, lot 1, is on the easterly side of Avenue C, extending from East 15th Street to East 16th Street and extending back on the streets 235 feet on each street.

Q. Did you value that property?

A. I valued that property at $139,500.

Q. How did you arrive at that valuation?

A. I valued a lot, 28 feet 3 inches front by 100 feet in depth on the northeasterly corner of Avenue C and 15th Street, at $11,000, and a lot adjoining the corner, 25 by 100, at $8,500. I valued the corner lot, 28 feet 3 inches by 100 feet, on the southeast corner of Avenue C and 16th Street, at $12,000; and the lot adjoining at $8,500; and four other lots facing Avenue C, each 25 by 100 feet, at $8,000, making $32,000. I value five lots on the north side of 15th Street, in the rear of the lots facing on Avenue C; these lots are 25 feet front each by 103 feet 3 inches in depth at $6,000, $30,000. I have remaining on 15th Street a small plot, 10 feet front by 103 feet 3 inches in depth, which I value at the rate of $6,000 a lot, which gives me $2,400. I value five lots on the south side of 16th Street, each being 25 feet front by 103 feet and 3 inches in depth, at the rate of $6,500 a lot. Total, $32,500. I have remaining on 16th Street a strip of land, 10 feet front by 103 feet 3 inches in depth, which I value at the rate of $6,500 a lot, or $2,600. That gives me my total of $139,500.

Q. Take Lot 26, same Block 989.

A. Block 989. Lot 26. That parcel is situated on the westerly side of Avenue D and extends from 15th to 16th Street, has a frontage on Avenue D of 206 feet 6 inches, frontage of 191 feet on East 15th Street and 191 feet on East 16th Street.

Q. What value did you place upon that?

A. I value that property at $96,480.

Q. How did you arrive at that valuation.

4204 A. I arrived at the valuation by facing all the lots on the street in preference to the avenue and divided them as follows: I value the lot 25 by 103 feet 3 inches on the northwest corner of Avenue D at $8,000, and the lot adjoining, same size, $6,500. I value five lots, each 25 by 103 feet 3 inches, on 15th Street, at $6,000 each, making $30,000; and the remaining strip, 16 feet in width by 103 feet 3 inches in depth, I value at the rate of $5,000 a lot, which makes $3,240. I value the southwest corner of 16th Street and Avenue D, being a lot 25 by 100 feet and 3 inches, at $8,000, and the lot adjoining, same size, $6,500; and six lots west of that, each 25 by 103 feet 3 inches, at $6,000 each, making $30,000; and the remaining strip, 16 feet wide by 103 feet 3 inches in depth, at the rate of $6,000, $3,240, giving my total of $96,480.

Q. Now, take Block 991, Lot 26, being property east side of Avenue D, running through to Tompkins Street, from 15th to 16th Street.

A. It is the entire block bounded by Avenue D, Tompkins Street, 15th and 16th Streets. That has a frontage——

Q. What value did you place upon that?

A. I valued that at $123,500.

Q. How did you arrive at that valuation?

A. I divided the block into four separate parcels, as that appears to me the natural way of subdividing the block if the block were placed upon the market in parcels. Plot A, situated on the southeasterly corner of 16th Street and Avenue D, having a frontage of 75 feet on 16th Street by 103 feet 3 inches on Avenue D, I value at $19,000. Parcel B, situated on the northeasterly corner of 15th Street and Avenue D, and facing the lots on the streets in preference to the avenue, gives me 125 feet on 15th Street by 103 feet 3 inches on Avenue D, I value at $32,500. Parcel C, being situated on the southwesterly corner of 16th Street and Tompkins Street and having a frontage on Tompkins Street of 112 feet 2½ inches and 4205 130 feet 2½ inches along its southerly lines, and thence northerly 103 feet 3 inches, and thence easterly along 16th Street 84 feet 2 inches, I value that $35,500. Parcel D, situated at the northwesterly corner of Tompkins Street and 15th Street, consists of a plot having a frontage of 112 feet 2¼ inches on Tompkins Street, 120 feet 8 inches on 15th Street, 103 feet 3 inches in the rear, 80 feet 2½ inches on the northerly side. This I value at $36,500, which gives me the total of $123,500.

Q. Now take the block just south, this being Block 991, Lot 1. Does this diagram which was put in evidence, Exhibit 48, correspond with the tax map?

A. It does not.

Q. What difference is there?

A. The tax maps show the distance on the southerly side of 15th Street between Avenue D and Tompkins Street to be 268 feet 6 inches, and the map furnished me shows the distance to be 278 feet 7 inches. The tax maps show the distance on the northerly side of 14th Street, between Avenue D and Tompkins Street, to be 355 feet 10 inches, and the map furnished shows it to be 371 feet 1 inch. The distance on Avenue D agrees with the map furnished—the tax map and the furnished map agree——

By Mr. MATHEWSON:

Q. When you said that this exhibit did not agree with the tax map you referred to Block 991, Lot 1, didn't you?

A. That is the only one. There is, I think, just a very slight difference—yes, there is a slight difference.

Q. It is not material?

A. I think not, sir.

Q. What is the width of 15th Street?

A. Avenue D is about 60 feet wide, and 15th and 16th Streets are each 60 feet wide.

Q. To the curb?

A. The official street.

4206 Q. To the curb?

A. No, not to the curb; to the house line.

By Mr. PAGE:

Q. You have assumed the exhibit to be correct?

A. I have.

Q. And now you may give the value.

A. The value of this plot is $199,500.

Q. Now you may state how you arrived at that result.

A. I face the lots on 14th Street, 15th Street and Tompkins Street and on Avenue D. I value the northeast corner of 14th Street and Avenue D, 25 by 103 feet 3 inches, at $11,000, and the lot adjoining at $8,000; and eight lots east of those on 14th Street at $7,000 each; making $56,000. I value the southeast corner of Avenue D and 15th Street, being lot 25 by 100 feet 3 inches, at $8,500, and the adjoining lot at $6,500; and six lots east of those at $6,000 each; making $36,000. I value the northwest corner of Tompkins Street and 14th Street, being a plot 112 feet 1¼ inches by 84 feet 10 inches on its northerly line and 103 feet 3 inches on its westerly line, and 121 feet 1 inch along 14th Street, at $39,000. I value the southwest corner of Tompkins Street and 15th Street, being a plot 112 feet 1¼ inches on Tompkins Street and 78 feet 7 inches on 15th Street by 103 feet 3 inches on its westerly line, and about 124 feet 10 inches on its southerly line, at $34,500. This makes the total, as I stated before, of $199,500.

Q. Now, Block 988, there is nothing else on that, is there?

A. There is nothing else on that. Block 988, that is the entire block bounded by East 14th Street and East 15th Street, Avenues C and D.

Q. What valuation do you give to that?

A. $402,500.

Q. How do you arrive at that result?

4207 A. I faced the lots in this block on Avenue C, 14th and 15th Streets, and not on Avenue D, except the sides of the lots. I value the northeast corner of 14th Street and Avenue C, facing it on 14th Street, being lot 26 feet front by 103 feet 3 inches in depth, at $13,500; and the adjoining lot at $9,000; I value twenty-three lots to the east on 14th Street, each lot being 25 feet front by 103 feet 3 inches in depth, at the average value of $8,000 each, which gives me $184,000; I value the northwest corner of 14th Street and Avenue D, being a lot 25 feet by 103 feet 3 inches, at $11,000, and the lot adjoining at $8,500; I value the southeast corner of Avenue C and 15th Street, being a lot having a frontage of 28 feet 3 inches on Avenue C by 101 feet in depth, at $11,000, and the lot adjoining on Avenue C at $8,500, the two remaining lots at $8,000 each, making $16,000; I value 21 lots on 15th Street, each 25 feet front by 103 feet 3 inches in depth, at $6,000 each, which makes $126,000; I value the southwest corner of 15th Street and Avenue D, having a frontage of 25 feet on 15th Street and 103 feet 3 inches on Avenue D, at $8,500; the adjoining lot facing on 16th Street at $6,500. The total is, as stated before, $402,500.

Q. I understand you have faced all the plot that fronted on 14th Street—that is, all the front of the entire block on 14th Street?

A. I did, in preference to the avenue.

Q. And the 106 feet on the 15th Street and Avenue C, you faced on Avenue C?

A. I did so; yes, sir.

Q. You have taken into consideration the fact that all this property, blocks 982, 989, 991 and 988, are in common ownership in making your valuations?

A. I have.

Q. And you have added to the valuation on that account?

A. I have. I have given that a fair consideration.

4208 Q. Now, we will turn to Block 688, between the marginal street and Tenth Avenue, West 16th and West 17th Streets.

A. I have that, sir. Do you want me to give the dimensions?

Q. Yes, you might give the dimensions that you valued.

A. This block has a frontage on Tenth Avenue of 184 feet, on the marginal street 197.6 feet, on West 16th Street 286.20 feet and on West 17th Street 357.29 feet.

Q. What value did you place upon that?

A. $300,350.

Q. How did you arrive at that valuation?

A. I valued the two corners of Tenth Avenue at $17,000 each, $34,000.

Mr. Mathewson: Which way did you run those lots?

The Witness: Faced them on Tenth Avenue. I value each lot adjoining the corners at $13,000, which made $26,000; three other lots on Tenth Avenue at $12,500 each, which made $37,500; then there is a strip 9 feet by 100 feet to make up the total at the rate of $12,500 a lot, which is $4,500. I value four lots on the north side of West 16th Street at $9,500 each, total $38,000; four lots on the south side of West 17th Street at $9,500 each, making $38,000; and another lot on the south side of West 17th Street, 25 feet by 109 feet in depth in the rear of the marginal street lots, I value at $10,000; the northeast corner of the marginal street and 16th Street, being a lot 25 feet by 86.20 feet, I valued at $17,500; and the southeast corner of marginal street and 17th Street, being a lot 25 feet wide on the average, it is diagonal there, by 132.29 feet in depth on its longest side at $20,000; and five marginal street lots at an average of $14,000 each, they differ in depth, making $70,000; and
4209 the remaining strip, about 9 feet wide, at $4,850, which gave me my total of $300,350.

Q. You have, as I understand, laid these lots out for your own estimation of valuation?

A. I plotted the parcel, disregarding the present lot lines.

Q. You may take Block 689, lot 17.

A. Do you want the dimensions?

Q. That is the entire block?

A. The entire block.

Mr. Mathewson: As now existing?

The Witness: As now existing, yes, sir.

Q. West 17th to West 18th Street, Tenth Avenue and the marginal street?

A. Yes.

Q. You may proceed.

A. Do you want the dimensions?

Q. Yes, I think you had better give the dimensions to identify your valuation.

A. This is the entire block between Tenth Avenue, the marginal street, 17th and 18th Streets. It has a frontage of 184 feet on Tenth Avenue, 197.26 feet on the marginal street, 380.47 feet on West 17th Street and 451.55 feet on West 18th Street.

Q. What value did you place upon that?

A. $371,350.

Q. How did you arrive at that valuation?

A. I valued the two corners at Tenth Avenue at $17,000, making $30,000; the two lots adjoining the corners at $13,000 each, $26,000; three other lots on Tenth Avenue at $12,500 each made $37,500; one lot 9 feet wide, that is, a strip 9 feet wide by 100 feet in depth, at the rate of $12,500, $4,500; I valued eight lots on 17th Street, 25 feet front by 92 feet in depth, at $9,500 each, which made $76,000; eight lots on 18th Street, each 25 feet front by 92 feet in depth, at $9,500 each, $76,000; one lot on 18th Street in the rear of the marginal street lots, 25 feet front by 109 feet in depth, at $10,000. I valued
4210 the northeasterly corner of the marginal street and 17th
Street, the lot on the square, about 25 feet average width and longer along the street, because there is an angle there, and a depth of 80.47 feet, at $17,000; the southeast corner of the marginal street and 18th Street, being a lot 25 feet wide on the average and a little longer on the marginal street front because it is an angle, and 136.55 feet in depth, at $25,000. I valued five other lots on the marginal street at an average of $13,100 each, making $65,500, and the remaining strip, 9 feet wide, at $4,850, giving me my total of $371,350.

Q. Now, take Block 690, lot 12.

A. Block 690, lot 12. This is an irregular shaped piece of property, but it comprises nearly all the block bounded by Tenth Avenue, marginal street, West 18th and West 19th Streets, excepting about 145.82 feet on 19th Street, and that distance is not continuous; there are parcels out of it, parcels out of the 19th Street front.

Q. As shown on Exhibit 48?

Mr. MATHEWSON: 125 feet, all told.

The WITNESS: No, I make it more than that; I make it 145 feet, because there is 20 feet on the corner; there is a little bit of a strip there on the corner.

Mr. MATHEWSON: Yes, quite right.

Q. Well, there are two parcels of 50 feet each that are out and one of 25 feet, and the corner, 20 feet 8 inches?

A. Yes, the corner, 20.82 feet, the corner of the marginal street and West 19th Street.

Q. What valuation did you place upon this property?

A. I valued that property at $386,350.

4211 Q. Now, you may proceed to give the method of arriving at this valuation.

A. I valued the two corners on Tenth Avenue at $17,000 each, making $34,000; two lots on Tenth Avenue adjoining the corners at $13,000, making $26,000; three lots on Tenth Avenue at $12,500, making $37,500, and the remaining 9 feet on Tenth Avenue at the rate of $12,500 a lot, which would be $4,500. I valued eleven lots on 18th Street at $9,500 each, $104,500; eight lots on 19th Street at $9,500, making $76,000; I valued the northeasterly corner of the marginal street and 18th Street at $17,000, and the southeast corner of the marginal street and 19th Street at $20,000. That is, including this little piece, which I afterwards deduct. I value five lots on marginal street at an average of $13,100, $65,500, and a strip 9 feet on the marginal street, $4,800, gives me a total of $389,850, from which I deduct $3,500, because the lot on the southeasterly corner of the marginal street and 19th Street has a piece of front out, which gives me my total of $386,350.

Q. Block 691.

A. Block 691, Lot 11. I valued that at $146,850.

Q. How did you arrive at that result?

A. Northeasterly corner of marginal street and 19th Street, $17,000; southeasterly corner at $21,000; I valued the lot adjoining the northeasterly corner of 19th Street at $13,000 and the lot adjoining the southeast corner of 20th Street at $15,000 and the next lot south of that at $13,000; next lot south of that at $13,500; and the strip 9 feet in width I valued at—there is a little difference there—I want to correct it—I shall have to correct my total, too—at $4,500; next lot south at $12,500, one lot on 19th Street at $9,500 and three lots on 20th, one at $9,500, one at $10,000, one at $8,000, making $27,500, that is $142,350, in place of what I stated before.

4212 Q. In place of $146,850?

A. Yes.

Q. Block 666, Lot 3?

A. Block 666, Lot 3 and Lot 12, I have placed no value on those because I assume from the information that I have that the title to this land is vested in the city; the lots do not now appear on the tax map.

By Mr. **Mathewson**:

Q. You have made no estimate of what the value was before they were taken by the city?

A. They were taken off the tax maps in November, 1904.

Q. But I say you have made no estimate of what their value was before they were taken off?

A. I cannot see them, only on the map.

Q. No, I suppose not?

A. I have made no estimate.

By Mr. **Page**:

Q. The next is Block 716, Lot 14?

A. This is a parcel having a frontage of 75 feet on the northerly side of West 18th Street and a depth of 92 feet; the parcel is 275 feet east of Tenth Avenue. I valued it at $36,000.

Q. That is the land without the buildings?

A. Yes.

Q. How did you arrive at that?

A. Three lots, each 25 by 92 feet, $12,000 each.

Q. What kind of a building was on there, have you noted that at all?

A. I have not it noted here; I have it in my notes taken at the time I went over the ground; I have only the land here.

Mr. **Mathewson**: I understand this witness in all his testimony regards the land only and does not take into consideration the buildings.

The WITNESS: I have not taken into consideration any buildings.

4213 Q. On Block 766, Lots 3 and 12, being two blocks, you find that the tax maps have been corrected by eliminating them, do you?

A. The tax maps have been corrected by the surveyor of the Tax Department, making a note on the official tax map, showing that they were taken, and the date is mentioned when he made his correction on the map.

Q. And what date was that?

A. November, 1904. That is always done on receipt of a letter from the Corporation Counsel.

By Mr. MATHEWSON:

Q. You did not observe any note that they had not been paid for, did you?

A. No, sir.

By Mr. PAGE:

Q. Block 715, Lots 51 to 59?

A. Block 715, is Lots 51 and 59, I have it.

Q. Well?

A. These two numbers combined show a parcel 225 feet front on the southerly side of West 18th Street, 150 feet east of Tenth Avenue. They are divided that way, but it is 225 feet.

Q. What value did you place upon this?

A. $108,000.

Q. And how did you arrive at that valuation?

A. Nine lots frontage, at $12,000 a lot.

Q. Block 951, Lot No. 35?

A. That is a parcel situated on the south side of East 20th Street, 94 feet west of Avenue A. It is a parcel having a frontage of 176 feet on the street and a depth of 92 feet. My value for that is $52,000.

Q. How do you arrive at that value?

A. I valued it at the rate of $7,500 a lot, or $300 a front foot.

Q. We will take Block 952, Lots 7, 29, 30, 33, 34 and 35. What was the total of your valuation?

A. $333,800.

4214 Q. Now you may give your method of arriving at that result?

A. The property consists of nearly the entire block between First Avenue, Avenue A, 20th Street and 21st Street, except a strip 96 feet wide on each street, and a frontage of 184 feet on First Avenue. The First Avenue front is out. I valued two corners on Avenue A, 25 x 100 feet, at $28,000; those lots are 25 feet front by 100 feet in depth. Two lots next the corners, at $11,000 each, $22,000; three lots facing on Avenue A, at $10,000, making $30,000; the remaining 9 feet by 100 feet at the rate of $9,500 a lot, $3,600; sixteen lots on East 20th Street at $7,500, and the remaining 17 feet on East 20th Street at the rate of $7,500, $5,100; sixteen lots on East 21st Street at $7,500 a lot, $120,000; the remaining 17 feet on East 21st Street at the rate of $7,500 a lot, $5,100, which gives me a total of $333,800.

Q. Take Block 953, Lot L.

A. 953, Lot 1——

Q. That is the entire block?

A. That is the entire block bounded by First Avenue, Avenue A, 21st Street and 22d Street. I valued that block at $435,700.

Q. How do you arrive at that result?

A. I valued the two corners on First Avenue at $16,000 each, $32,000; two lots next the corners at $12,000, $24,000; three lots on First Avenue at $11,000 each, $33,000 each; lots 22 feet 6 inches by 100 feet on First Avenue at the rate of $11,000, $9,900; the two corners on Avenue A, at $14,000 each, $28,000 two lots next the corners, at $11,000 each, $22,000; three lots at $10,000 each, $30,000; lot 22 feet 6 inches by 100 feet, at the rate of $10,000, $9,000; sixteen lots on 21st Street, at the rate of $7,500 a lot, $120,000; the remaining 13 feet by 98 feet 9 inches on East 21st Street at the rate of $7,500 a lot, $3,900; sixteen lots on East 22d Street, at the rate of $7,500 a lot, $120,000; strip 13 feet front on 22d Street, at the rate of $7,500 a lot, $3,900, making the total of $435,700.

4215 Q. Block 979, Lot 1.

A. Block 979, Lot 1: I have assumed that to be the entire block between Avenue A, marginal street, East 21st and East 22d Streets.

(Question withdrawn.)

Mr. **Page**: We seem to have reached our limit with this witness at present. He says he can get ready and finish to-morrow morning Mr. Burr had expected to have some witnesses to-day, but they are not ready.

Mr. **Mathewson**: I shall ask that some witness be called, Mr. Master.

Mr. **Burr**: Then I shall ask you, Mr. Mathewson, can you produce Mr. Carter? I can use him on further cross-examination this afternoon.

Mr. **Mathewson**: Hardly on cross-examination. You are in your own case. Mr. Carter's cross-examination is finished.

Mr. **Burr**: No, the idea was if we wanted any further cross-examination it must be at the expense of our own time, and I want to examine Mr. Carter with regard to the franchises regarding which he gave some testimony in response to your questions. I wish to examine him also with regard to certain complaints which he signed, and as to what those complaints contained. The complaints I refer to being applications or actions in proceedings to have the assessment upon special franchises reduced, &c.

Mr. **Mathewson**: I don't know what the proposition is, but our case is closed and if Mr. Burr wishes to present testimony in his case, why, I presume he can do so.

Mr. **Burr**: I think the understanding was that we might have any time desired as long as we consumed our own time, and that 4216 we could have either Mr. Bradley, Mr. Simpson or Mr. Carter for further cross-examination.

Mr. Mathewson: On the contrary, before we closed our case, and when you were finishing on cross-examination, I think the Master suggested that further cross-examination might come out of your own time. Our case is closed. There is no witness under cross-examination—not by you—there may be by me.

Mr. Burr: I know, but you remember we were compelled to allow you to finish without interruption. That was the order of the Court and the idea was if we needed further cross-examination it must come out of our time.

The Master: Unless you show some stipulation or understanding on the record that the cross-examination of any of those witnesses was left unfinished you will have to call Mr. Carter as your own witness. No doubt the other side will produce him without subpœna.

Mr. Burr: Yes. Well, will you produce Mr. Carter this afternoon?

Mr. Mathewson: If you wish Mr. Carter and call him as your witness I imagine he will appear, but I think he would like to know what you are going to examine him on.

Mr. Burr: I have stated it—regarding what he knows respecting the valuation of the franchises.

The Master: Have you anybody else you can produce now with whom to fill up the time?

Mr. Page: No.

Mr. Burr: I want to say that Mr. Freidman of our office is in negotiation with Mr. Beets of Sherman & Sterling for the purpose of simplifying the production of evidence regarding the title to the marginal streets, and it will save an immense amount of documentary 4217 evidence and so forth if they can succeed in arriving at a stipulation which will be mutually satisfactory. Mr. Friedman is a very sick man and can only spend half a day in our office daily, and I am doing this as well as I possibly can through him, in this regard: He was here this morning and said he would have the whole matter in shape to-morrow morning. I expect it would be in shape this afternoon, but if Mr. Mathewson will produce Mr. Carter this afternoon I will consume as much of the time as may be necessary in the examination of Mr. Carter with regard to this particular matter of franchises and——

The Master: Will that close your case, Mr. Burr?

Mr. Burr: Oh, no.

The Master: In view of this application and Mr. Burr's apparent surprise that the close of his case should be regarded as near, I want to state, having in mind the last extension, which was until December 10th, that except for some very cogent cause shown, which I do not now anticipate, I shall decline personally to certify to the necessity of any further extension of time after that date.

Mr. Burr: We have subpœnaed various officials of the Consolidated Gas Company and expected them here to-day, our accountants are getting their report, our engineers are ready to continue their examination of the plants and report upon the value of the same. All of that takes time. We have been working night and day to hasten the completion of this case, and are just as anxious as counsel on the other side or the Master to bring it to a speedy completion, but there is a limit to human endurance and I do not think 4218 we can be accused of laches or neglect in prosecuting the defense of this case.

Mr. MATHEWSON: Do I understand neither Mr. Marks nor Mr. Lacombe have yet been up to the plant?

Mr. BURR: Mr. Marks, since you ask the question, and Mr. Lacombe, have made a visit to the plants, which I was writing you about for the past two weeks, to enable them to pass upon certain vouchers, and that enabled them on last Saturday to pass upon those vouchers. The passing of the engineers upon these vouchers necessitated the accountants to go all back over their accounts, so that they were not able to present their accounts to-day as I expected. They are working at it and will have it out in a few days. Now they are asking to go through the plants with an inventory such as was supplied, for the purpose of putting a valuation upon each particular piece of apparatus and coming here and testifying what in their opinion is a fair and reasonable valuation of each piece of apparatus, including the holders and plants of the Consolidated Gas Company.

Mr. MATHEWSON: I would like to say that the Master knows that when the engineers had permission to go to the works, and they have been there ever since all they cared to; and now to have the accountants held up and have the valuation of plants held up because two witnesses want to go to work now and value the different pieces of apparatus, which is an utter impossibility, of course, in the time at their disposal, is not just, and I do not think it is proper. It is a delay that we should not be subjected to. These accountants were expected to complete their work and be ready to proceed 4219 long ago, and they could have been if they had conducted the thing with discretion and proper consideration, I think. I shall certainly object to suspending this proceeding for the purpose of further investigations by the accountants or further valuations by the engineers.

Mr. PAGE: I, of course, expected the Gas Company would take such an attitude. The counsel for the Consolidated Gas Company knows very well the reason why Mr. Hough was not called as a witness, that after having made the examination he refused to give us the valuations that we desired, because of an evident friendliness to the complainant in this action.

Mr. MATHEWSON: Do you want to say that?

Mr. PAGE: I do. If you are going to make these statements I will make mine.

Mr. MATHEWSON: I have made no such statement.

Mr. PAGE: I know you have not made any such statement but I am making mine. Of course I do not know what has influenced him to take the position which he did, which took me entirely by surprise and has rendered it necessary to get other engineers on the work. We met the same trouble in securing real estate experts, that after having secured them and they having retained our papers for some time they returned them stating that they did not wish to testify as against the Consolidated Gas Company.

Mr. Mathewson: I know nothing about that. I know nothing about Mr. Hough or the reasons why he does not testify, nor does the complainant. Nor as to any of these real estate experts. But what is the matter with the accountants? Why cannot they go 4220 on? They are not valuing anything. They have been at the books there for six weeks or such matter; they must have been able to find out whether Exhibit 94 represents actual disbursements or not. Then it is a question, if there are any items to be objected to by way of argument, whether they are allowable in the cost of gas or not. I cannot see any reason for holding that up.

The Master: You remember counsel thought it would not take them thirty days to put in their entire case on the defense originally.

Mr. Burr: They will explain the delay when they present their report, which will be in a few days.

Mr. Mathewson: When I object to the time and the adjournments I object to it not because this company has any desire, and I do not think they have evinced any desire, to treat this situation unfairly; but we are suffering, we are suffering delay, we are suffering great loss and embarrassment by reason of this case being unclosed; other suits are being brought against us by the dozen—mandamuses and injunctions. We are being embarrassed and put to expense in innumerable ways that it is difficult for the Master or other counsel to appreciate. They could not appreciate fully without our taking any amount of time to make it clear.

The Master: All I can say, gentlemen, is that I am at your disposal at any time or at any hour.

Mr. Page: I apply now for an adjournment until to-morrow morning.

The Master: I have always been anxious to prosecute this case Saturdays and any other time that would tend to get it out 4221 of the way. I do not know anything about what the effect on the Gas Company is, but the instructions of the Court to speed the case were explicit, and it is not only a question of my personal convenience and my other business, but I think it must affect all counsel in the case alike. I cannot see any reason why instead of trying to waste time apparently, we should not be solicitous of saving it.

Mr. Burr: I must take exception to the statement of the Master that we are trying to waste time apparently, because I know to the contrary. We have been trying to hasten the conclusion of this case as much as any men can possibly desire or attempt.

The Master: Well now, you will go on at two o'clock, will you, Mr. Burr?

Mr. Burr: If Mr. Mathewson will have Mr. Carter here.

Mr. Mathewson: I cannot produce him. I will tell him you desire him as your own witness on some franchise matters and I imagine he will come.

Counsel now arrange by telephone to have Mr. Carter present at 2:15 P. M. to-day.

At 1:00 P. M. adjourned to 2:15 P. M.

4222 After Recess.

Robert A. Carter, called as a witness in behalf of the defendant, the City of New York, testified as follows:

Direct examination by Mr. Burr:

Q. (Handing paper.) Mr. Carter, I show you this paper and ask you if that is your signature appearing on page 10 and again on page 11?
A. Yes, sir.
Q. This paper to which your signature is attached on the pages named is the complaint in the matter of assessment and valuation for taxation of the special franchises of the Consolidated Gas Company before the State Board of Tax Commissioners, is it not?
A. Yes, sir.
Q. For what year?
A. For the year 1905, apparently. It might be well to confirm that.
Q. Verified the 20th day of March, 1905. This action was brought to have modified or set aside the assessment for the year 1905, was it not?
A. I presume it was an application for the reduction of the assessment, Mr. Burr, that is my understanding of it.

Mr. Burr: I will hand it to Mr. Mathewson, so that he may see that that is exactly what it is.
Mr. Mathewson: I think that is generally correct.
Mr. Burr: There can be no doubt that this is the complaint in the proceedings brought by the Consolidated Gas Company to have reduced the assessment of 1905, placed by the State Board of Tax Commissioners upon the special franchises.
The Master: Well, does it not show on its face what it is?
4223 Mr. Burr: Well, there was some doubt about it, and I showed it to Mr. Mathewson.
Mr. Mathewson: Mr. Carter knows more about it than I do.
Mr. Burr: I ask to have it marked for identification.
Paper marked for identification City's Exhibit 64.

Q. (Handing paper.) Look at this paper which I hand you and be good enough to say whether the signature there is your signature?
A. Yes, sir.
Q. You signed this paper on behalf of the Consolidated Gas Company?
A. Yes, sir.
Q. As appears at folio 24, and you verified it as appears by the last page?
A. Yes, sir.
Q. This is the complaint in the proceeding before the State Board of Tax Commissioners to have the assessment of 1906 reduced, is it not?
A. Yes, sir.

Mr. Mathewson: What was the date of the verification of that?

Q. The date of the verification appears to be the 26th day of March, 1906. Is that correct, Mr. Carter?

A. Yes, sir.

Mr. **Burr**: I ask to have paper marked for identification

Paper marked City's Exhibit No. 65 for identification.

Q. In the 1905 complaint, City's Exhibit 64 for identification you say "the value of complainant's special franchises in the City of New York does not exceed the sum of $4,261,156; the excess of the said over-valuation is therefore $26,238,844." Will you explain, if you please, how you arrived at those figures?

4224 *The* **Mathewson**: The petition, I think, Mr. Master, shows exactly what the argument was, and the basis upon which that estimate of the witness, so far as it was the witness's estimate, if at all, was reached. It seems to me the paper itself is the best evidence of that, if it is pertinent evidence at all.

Mr. **Burr**: We are entitled to know the facts upon which Mr. Carter based that assertion in this sworn paper.

Mr. **Mathewson**: But the paper——

The **Master**: The paper is not in evidence.

Mr. **Mathewson**: The law provides itself that you shall set forth in the petition, your grounds, and they are there set forth, and the question now is, what are the grounds. I say the paper itself shows.

Mr. **Burr**: I ask him if it is not a fact that in this paper he did make the statement I have given, that is that the value of the complainant's special franchises in the City of New York does not exceed the sum of $4,261,156, and I asked him upon what he bases that statement.

The **Master**: Well, did he say that he did make that statement in the paper?

Mr. **Burr**: Yes.

Mr. **Mathewson**: That is the petition of the company merely verified, as is any pleading, by an officer of the corporation.

Mr. **Burr**: Won't you let Mr. Carter do some testifying. We can get along much faster.

Mr. **Mathewson**: That is not testifying. I am merely calling attention to the fact that it is not Mr. Carter's petition. It is the company's.

The **Master**: You may answer it, Mr. Carter.

Mr. **Mathewson**: Exception.

4225 A. I should not like to testify offhand as to how those figures were reached, without having some opportunity to consult whatever original data or memoranda there may be available in connection with this complaint. I think that the amount named is approximately the value of the tangible property—I will correct that—the valuation placed upon the tangible property in the report to the State Board, based upon the cost of reproduction, less depreciation for the purposes of taxation.

Q. I call your attention to a statement in the verification signed by you to this paper: "Deponent has been continuously engaged in the gas business since the year 1877, having been employed by the

Consolidated Gas Company and one of its predecessor corporations in various capacities from that of junior clerk to that of general accountant; and deponent has also been for several years connected with the Consolidated Gas Company in an official capacity, having served that company as comptroller and as secretary. Deponent is thoroughly familiar with the gas business in the City of New York and especially in the Borough of Manhattan in said city. Deponent knows the extent and nature of the special franchises possessed by the Consolidated Gas Company and by all the other gas companies operating and doing business in the Borough of Manhattan and is familiar with the business and operation of all said companies. Deponent has made a careful and thorough study of all details of the gas business and is familiar with the intrinsic and relative value of the special franchises possessed by the different gas companies in the Borough of Manhattan in said city." That is a correct extract from your verification, is it not?

A. Yes.

4226 Q. And that was true at the time you swore to it?

A. Yes.

Q. And it is true now, is it not?

A. It is true now I believe.

Q. Well, have you any recollection as to how you arrived at that figure, Mr. Carter?

A. No recollection as to those specific figures, Mr. Burr; some recollection as to the general theory upon which that amount was stated; as advised by counsel, that this property and all other property that the company might own for the purpose of taxation possessed a value such as they would bring if sold under ordinary circumstances, and my impression is and my recollection is that counsel advised us that if sold under ordinary circumstances, the franchises, however valuable they might be to the Consolidated Gas Company as a going concern, would have some such value as its plant would have if scrapped—practically none.

Q. Did you arrive at it by taking the original amount fixed in 1884 as you have testified heretofore, for the complainant, $7,781,000, and allowing for depreciation from that amount—did you in other words, by allowing for depreciation on the original valuation fixed upon these franchises in 1884, arrive at the figure $4,261,156?

A. I am not aware that that was done, Mr. Burr. I have no recollection that that method was pursued at all. In fact, I think I can testify very plainly that it was not.

Q. You stated in this complaint further: "There is no method or evidence by which the value of the intangible right to lay and maintain mains and pipes in the streets can be determined. There exists no market or demand for such right, permissions and franchises. The price at which complainant's franchise or rights would sell under ordinary circumstances is merely nominal. The municipal authorities of the City of New York have never fixed any amount as the consideration for granting such a franchise, and the right to lay mains and pipes in the streets has always been procurable from said municipal authorities without the payment of any monetary consideration therefor. The number of said 4227 franchises which may exist at any time have never been limited by said municipal authorities. The value of said right to occupy the streets does not exceed the cost of procuring such a right from the city and that cost is nominal." Is that a correct extract from this sworn complaint, and did you so state?

A. Yes, sir.

Q. Was it true then, and is it true now to the best of your knowledge, information and belief?

A. For the purposes of that statement, I have no reason to change it.

Q. Well, it was true when you swore to it, was it not, Mr. Carter?

A. Yes, sir.

Q. And it is true to-day?

A. True to-day, with this diefference, I think you will find a difference between that and the next application for a reduction, Mr. Burr.

Q. We will come to that.

Mr. **Mathewson**: In City's Exhibit 65 for identification?

The **Witness**: City's Exhibit 65 for identification, we recognized the fact that the Supreme Court of the United States confirmed a valuation——

Mr. **Burr**: I move to have that striken out. Mr. Mathewson is not examining the witness.

Mr. **Mathewson**: You asked him whether it was true or not, and he said it was with this modification. Can you let him finish it?

The **Witness**: I must modify it with respect to such modification as appears in our next application. 4228

Q. I will ask you about the next application when the time comes, but what I ask you now is whether that specific statement was true when you swore to it and whether it is true now?

A. It is true now except with the modification that appears in the next application by the company for the valuation of its special franchises.

Q. In other words, you would be understood as saying it was true then and is true now subject to some modification that you made in some subsequent paper that was subsequently sworn to by you?

A. Exactly.

Q. Have you any data in your custody or under your control showing the manner in which you arrived at this figure of $4,261,156?

A. I am not aware whether I have or not or whether that figure may have been reached by counsel, having before him whatever facts were available; and having arrived at the figure, why, I naturally would accept his conclusions in subscribing to that document.

Q. But I understood you to say in your sworn verification that you yourself were entirely familiar with the valuation of the special franchises and that they are correct and full and so forth?

A. As I have already stated, where advised by counsel that there is one valuation of property that is owned and operated by a going concern and there is another value of property which it would bring if sold under ordinary conditions and circumstances, and that it is the latter value that is generally supposed to be its value for the purposes of taxation.

Q. Well, you say that you believe, you are not certain, but that you think you arrived at that figure, $4,261,156, as the result of consultation with counsel?

A. Why, most decidedly, it was by consultation with counsel, because we——

4229 Q. I understood Mr. Mathewson to say he knew nothing about this matter and disavowed any connection with it a moment ago?

A. Mr. Mathewson was never counsel for the company in any of these special franchise proceedings.

Q. Then you refer to other counsel?

A. Yes, sir, I refer to other counsel.

Q. Can you give me the names of such counsel?

A. Yes, sir; Boardman, Platt and Soley were our counsel in these proceedings.

Q. You have no independent recollection at this moment of how you arrived at that $4,000,000?

A. No, I have not, Mr. Burr.

Q. Can you say positively that it was the result of consultation with counsel that that figure was fixed?

A. Positively, yes.

Q. Do you recall the particular time and place where the amount was agreed upon?

A. Are you referring now to 1905?

Q. I am referring now to 1905.

A. Well, as I always have had interviews with counsel in that case in the office of counsel, it could only have been there.

Q. And what is your best recollection—that you suggested the amount or that they suggested the amount?

A. Absolutely, that they suggested it.

Q. They suggested it and you swore to it?

A. That is the case.

Q. The assessment fixed in 1905 was $30,500,000, was it not? That was the assessment which you sought to have reduced by this proceding to which I have referred and in which this is the complaint, referring to City's Exhibit 64 for identification?

A. My recollection is that that was, Mr. Burr, the tentative assessment.

Q. Here it is right here (indicating).

A. Well, of course, I assume that that is right, that that is the tentative assessment.

4230 Q. $30,500,000?

A. Yes, sir.

Q. And you claim that that was an over-valuation by $26,238,844?

A. That is the amount stated in the complaint.

Q. As being the over-valuation?

A. As being the over-valuation.

Q. Now, the amount of the tax for 1906 as appears by this complaint, City's Exhibit 65 for identification, was $31,900,000; is that a fact?

A. That is the case, yes, sir.

Q. And the company claimed that that assessment was erroneous and illegal, did it not?

A. Well, as to the terms, I cannot subscribe to that exactly. It was an application, I understand, for a reduction of the assessment and certain allegations.

Q. Well, this was the complaint?

A. If that will show me the terms "erroneous and illegal" I will tell you whether the document states it.

Q. Exhibit 65 was the complaint in the proceeding to compel a reduction of that tax of $31,900,000, was it not?

A. I think not to compel a reduction. I think it was an application for a reduction and I do not think it could be compelled by any such application.

Q. Well, was not this an action to have the tax declared illegal, erroneous and unequal.

Mr. MATHEWSON: Merely a petition filed with the State Commission.

Q. Well, a petition—a proceeding; I should not have said action. This is the language, is it not, "erroneous, unequal and illegal"?

A. That is the case, yes, sir.

Q. And in the verfication to this complaint you made the same statement with regard to your familiarity with the gas business and the value of special franchises and the fact that you had 4231 made a careful and thorough study of all the details of the gas values and you were familiar with the intrinsic and relative values of special franchises possessed by the Gas Company in the City of New York and the different boroughs of such city, as you did in the other complaint to which I have referred and from which I have quoted specifically; that is true, is it not?

A. That is the case, yes, sir.

Q. Now, in the complaint in the proceeding regrading the assessment of 1906, you say:

"The said assessment of $31,900,000 largely exceeds the value of complainant's special franchises. The true value of complainant's franchises in the City of New York and the amount for which same would sell under ordinary circumstances does not exceed the sum of $14,000,000. The extent of the said over-valuation is $17,900.000."

Upon what basis did you fix the sum for this year at $14,000,000?

A. That was the amount of an assessment, I think the first assessment against the company's special franchises which had been confirmed by the Supreme Court of the United States for approximately that amount.

Q. You think that the Supreme Court of the United States meanwhile, between the first complaint and the second complaint, between Exhibit 64 for identification and Exhibit 65 for identification, had fixed the sum of $14,000,000 as a proper tax on your special franchises, do you?

A. Not exactly $14,000,000. $13,900,000, if my memory serves me.

Q. Do you know or can you state offhand what was the amount of the special franchise for 1905 as fixed finally?

A. To the best of my recollection it was $27,300,000.

4232 Q. In the complaint, Exhibit 64 for identification, you state:

"If the value of the tangible property in the streets, $4,261,156 is deducted from the amount of the assessment, the assessment upon the intangible element of the special franchises alone is $8,599 for each cubic foot of space occupied by the mains and pipes of the complainant in the streets of said city."

Was that true at the time, or did you believe it to be true?

A. Just a calculation. It must have been true. I did not make the figures myself, but I assume they were correctly made.

Q. Well, your idea was, and the understanding at the time you swore to this paper was, that $4,261,156 represented the value of the tangible property in the streets?

A. No. It was a valuation placed upon the tangible property in the streets assuming certain conditions in the laying of the mains and certain depreciation in value as indicated by the report to the State Board of Tax Commissioners.

Q. And that is the idea you had in mind when you swore in paragraph first of this complaint, Exhibit 64 for identification:

"The value of complainant's special franchises in the City of New York does not exceed $4,261,156."

A. I assume that to be the case, especially if those figures agree.

Q. Now, for the year 1906 how much of the $14,000,000 which you say is the true value of complainant's special franchises in the City of New York, how much of that $14,000,000 was embraced in the tangible property or represented by the tangible property in the street?

A. I don't know.

4233 Q. Well, do you know whether a different theory was adopted in making up the petition of 1906 from that adopted in making up the petition for 1905?

A. Only such differences as the complaint itself would indicate.

Q. In 1905 the $4,261,156 which you stated was the value of the tangible property in the streets was claimed by you to be the value of the special franchises. Now I ask you in 1906 where you say that $14,000,000 is the proper or true value of complainant's special franchises, what part of that $14,000,000 is made up of the tangible property in the streets?

A. There is no separation of it in the complaint, and I would have no information other than was contained in the complaint regarding the complaint, Mr. Burr.

Q. Have you any independent recollection as to how you arrived at the $14,000,000?

A. I have already testified that the $14,000,000 was almost exactly the value of the special franchises, including the tangible property in the streets, which had been confirmed by the Supreme Court of the United States.

Q. But you have no independent recollection of how much of that $14,000,000 was represented by the tangible property in the streets?

A. The Supreme Court of the United States never indicated it.

Q. You are familiar, I suppose, with the decision?

A. I am familiar enough with it to know that.

Q. But you know that in that assessment of $14,000,000 which you claimed was correct, the tangible property in the streets was embraced?

A. That is my understanding.

Q. Do you remember verifying, Mr. Carter, a petition dated July
15th, 1903, for the purpose of obtaining a writ of certiorari
4234 to review the assessment made by the State Board of Tax
Commissioners of the State of New York for the year 1903
against the Consolidated Gas Company?

A. No, sir, I do not recall the incident, but I can identify my signature if it is on the paper, Mr. Burr.

Q. Well, I only have the copy. Wouldn't you from the copy?

A. No, sir, that is not my signature.

Q. That is a copy of the original, that is the only paper I have at present. Would that not refresh your recollection?

A. No, it would not.

Q. This is a copy served upon the State Board of Tax Commissioners as appears by the admission of service of the Clerk of the State Board. If there is any doubt about it I will have the original produced. You must have the original, I suppose, or must have it on file. That is the copy that was filed and served on the Board.

Mr. Mathewson: I have no reason to doubt that this — a copy, Mr. Burr. I am utterly unfamiliar with it myself, and that is the most I can say.

Mr. Burr: I will have it marked for identification.

Paper marked for identification City's Exhibit 66.

Mr. Mathewson: I have no objection to your questioning the witness on it, subject to verification later, if you wish.

Mr. Burr: Yes, subject to comparison and confirmation later.

Q. Did you in pursuance to Section 43 of the Tax Law of the
State, and within 30 days after the said section took effect, make a
written report to the State Board of Tax Commissioners as to each
of the special franchises owned by your company, and as to
4235 all matters required by said section to be reported to the said
State Board, as appears in this paper or petition to which I
have referred and which has been marked for identification City's
Exhibit 66?

A. I assume that this paragraph refers to some prior similar report made in some previous years. As I did not make the report and have not it before me I cannot possibly testify positively of my own knowledge as to what was done, but I presume that the law was complied with and that the report covered those points.

Q. But if you signed this petition at the time which this copy purports to have been signed and verified by you, that is, on July 15th, 1903, the statements there contained in it were true at that time and they are true now?

A. I have no doubt of it. I of course have no knowledge of that particular paper which you have there. It purports to be a copy of a document that I have seen, but of course I have no knowledge that it is.

Q. But if this statement to which I have called your attention appears in the original statement sworn to by you, that was a true and correct statement at the time and is true and correct now, is it not?

A. Yes, sir.

Q. If you in such petition made this statement:

"Your petitioner further shows that in said reports and supplemental reports made as aforesaid your petitioner duly reported to the said State Board that the tangible property included in the special franchises consisted of pipes and mains laid under said streets, highways and public places, and the value thereof based upon the cost of reproducing the same as required by said State Board."

Was that a true statement at the time you made it?

4236 A. If there was such a statement in the document signed by me, was it true?

A. Unquestionably, except, Mr. Burr, that may have been modified in testimony on the stand. I think now, particularly with respect to the cost of services, that I have testified myself that there was some mistake made in arriving at that value and that it was an error and in that respect I would say that the statement would be subject to such modification.

Q. Further, you said, that:

"Such assessment is erroneous by reason of over-valuation and the extent of such over-valuation is $13,972,743."

Do you recall the fact that you made such statement?

A. I do not recall it, Mr. Burr.

Q. Do you recall that you made any such statement as that, independent of this paper?

A. I unquestionably made some statement, but as to the figures named in it I haven't the faintest recollection in the world.

The Master: I do not quite understand the object of all this. I do not quite see, Mr. Burr, on what theory you call this witness and ask him whether statements made in written documents, which he admits were signed by him, were true. Why do you not put the documents in evidence and have done with it? It seems to me it is an unnecessary waste of time. I suppose that you want to show that the witness, acting on behalf of this complainant, has made statements which conflict with other evidence in the case. Why is not the best way to show that by putting the documents in evidence?

Mr. Burr: They are rather bulky.

4237 The Master: Well, it is taking up twice as much time as is necessary to put it in in any other way.

Mr. Burr: I wanted the witness's particular attention drawn to some statements in these documents, without offering the whole document in evidence, as I deemed the introduction of the whole document was unnecessary. He has placed values on the special franchises in these various petitions and complaints, and I was anxious to ascertain the basis on which he arrived at those figures.

Q. Now, the assessment tax placed by the State Board for the year 1903 was the sum of $17,985,000, was it not?

A. You cannot say that it was or was not from that document. I presume it was. My recollection was that it was approximately that amount, but I should want some other data to testify from than that document.

Q. Did you not state in this document:

"Your petitioner further shows that thereafter and on or about the third day of March, 1903, the said State Board still claiming to act pursuant to the tax law of the State and still claiming that the said pipes of your petitioner and the right, permissions and franchises to construct, maintain and use the same were subject to assessment in the City of New York, finally determined the value of said franchises to be the sum of $17,985,000, and on or about March 3, 1905, filed with the Department of Taxes and Assessments in the City of New York a written statement of such valuation as finally fixed and determined by said State Board and duly verified by the Secretary thereof, and at or about the same time gave notice in writing to your petitioner that such written statement had

4238 been filed with the clerk of the City of New York.

Now, if said statement appears in the original of this petition of which I have shown you a copy, was that a true statement?

A. And bearing my signature?

Q. Yes.

A. Yes, sir, unquestionably.

Q. What I want to arrive at and ask you to explain is how you arrived at the sum of $13,972,743 as being the excess over the true value when the valuation had been placed as I have stated and read from this paper at $17,985,000, the difference apparently being $4,012,257?

A. Well, without some data before me I could not testify as to how we arrived at that difference.

Q. Can you procure the data upon which you have computed these various valuations as I have called them to your attention?

A. Well, if they were made by counsel I can ask counsel for them and possibly procure them.

Mr. MATHEWSON: We doubt very much if they would be preserved. I do not know, but I do not believe now that we could tell just how that was made up.

Mr. BURR: I would like to know as a matter of fact and I think the Master would also like to know upon what basis these valuations varying from year to year were made up; also as to the data, whether it is destroyed, or no longer in existence, and whether there is anyone who can explain the basis or theory by which such valuations were arrived at.

Mr. MATHEWSON: The witness on the stand explained how one was arrived at. I suppose the same answer would apply in each case.

4239 The WITNESS: I think it would, Mr. Mathewson. I would say that the same theory applied in each case and that the same figures were used as the actual value for the purposes of taxation of the tangible property, that is, approximately the same figures, and in the year to which Mr. Burr is now referring it is probably the amount he names, but he is using a document not having my signature and therefore not having been actually verified by me as to its correctness of course I cannot possibly confirm figures that are there.

Mr. Burr: I state to you when examining you from these papers that this paper already marked for identification as City's Exhibit 66 is taken from the files of the State Board of Tax Commissioners, and purports to have been the copy served by Boardman, Platt & Soley upon that Board, and it is submitted to your attention subject to confirmation later on. If there is any mistake in any of the statements that I have read from that paper you are at liberty now or at any time to correct them, and it is always on the assumption that these statements are contained in the original paper that I am assuming to examine you.

The Witness: And where it is possible for me to answer I am answering, with that proviso, assuming these statements are correct copies of the original document bearing my signature; and, with respect to the particular items which you referred to, I presume the same fact obtains in respect to this 1903 application for a writ of *certiorari* as did in the 1905 application for a reduction of the assessment where the——

Q. You say you presume, but have you any independent recollection of the manner and the circumstances by and under 4240 which this amount of $4,012,257 was arrived at as being correct for the year 1903?

A. As for that year, I do not think testimony has been taken in the present and previous hearings, but certainly with respect to the other years, 1904 for example, a great deal of testimony has been taken as to how those figures were reached, and Mr. Simpson has testified, I think, as he was the man who made the figures up, and I have nothing to add to his testimony.

Q. I am asking you now whether you have any data upon which your figures are arrived at?

Q. Have you preserved yourself any data——

A. I think that figure would appear in the special franchise tax report which the company files every year with the Tax Commissioners and concerning which a great deal of testimony has been given by the company.

Q. I call your attention to Schedule D in this case, page 402 of Exhibits, and the item which appears there upon that page of "Contracts, rights and so forth, $7,781,000." Was this $4,012,257 embraced as part of that $7,781,000, or was it in addition to that $7,781,000 as appears there in Schedule D?

A. What is the figure you have in mind?

Q. I have in mind the figure which you stated was the correct and true valuation of your rights in the streets for 1903, $4,012,257, and I had in mind also the "contracts and rights" which appear in Schedule D, page 402, in this case, and stated at $7,781,000——.

A. And the question is what?

Q. Was $4,012,257 embraced in that $7,781,000, or is the $4,012,257 in addition to the $7,781,000?

A. I think it is independently entirely of the $7,000,000.

Q. Independent?

A. Yes, sir.

Q. It is embraced in this $7,781,000 as appears in Schedule D just referred to?

4241 Mr. **Mathewson**: The witness already testified to that at great length.

Mr. **Burr**: This is my witness, Mr. Mathewson.

Mr. **Mathewson**: I know, but he has already testified as to what that was long ago.

Mr. **Burr**: I object to these interruptions. You insisted I should call Mr. Carter as my witness. I have called him and I am asking a plain, simple question, and it is unnecessary to have any interruption, statement or additional testimony.

Mr. **Mathewson**: You examined him by the hour on that very subject, cross-examined him and finished with him.

The **Witness**: Do I understand that you want me to repeat what I have previously state- with respect to this item of assets?

Q. You say that this $4,012,257 which you claimed was a correct value of the franchises in 1903 is in addition to this sum of $7,781,000 as it appears on Schedule D, that amount on Schedule D purperting to be the amount of your franchises and rights?

A. The amount that you named $4,012,257 is entirely independent of the value placed upon the contracts, rights and other intangible property of the company.

Q. Very good. Now let me ask you how did you arrive at this figure $7,781,000 as the value of your rights?

A. I never did arrive at it. It was the value at which those intangible assets were carried on the books of the company. I never arrived at it; I am simply giving the value as it appears on the books of the company?

4242 Q. You mean to say you have carried that figure continuously on your books since 1884?

A. That is the case, yes sir.

Q. Without any variation whatever?

A. None whatever.

Q. And that arbitrary figure you have carried up to the present time on your books, is that right?

A. Yes, sir.

Mr. **Mathewson**: It was not an arbitrary figure. It was an amount at which they were appraised in 1884.

Q. In the complaint verified by you, City's Exhibit 65 for identification, you stated:

"The rights, permissions and franchises of the complainant and occupying the streets in the City of New York exist under certain laws specified in complainant's report to the State Board for the year ending June 30th, 1899, and complainant has acquired no new or different rights, permissions or franchises since the filing of said report."

Was that true and is that true still?

A. That is my understanding, yes, sir.

Q. Now, there was also a petition for a writ of *certiorari* to review the assessment imposed upon your company by the State Board of Tax Commissions for the year 1904, was there not? You know that as a fact?

A. There have been writs issued for every year and we have never succeeded in getting any reduction of the assessment, nevertheless.

Q. The State Board of Tax Commissioners fixed and determined the value of the special franchises of the Consolidated Company for the year 1904 at some $21,900,000, did they not?

A. That is my recollection, yes, sir.

4243 Q. In this petition for a writ of *certiorari* which I show you and which purports to have been signed by you and verified by you as Secretary of the Consolidated Gas Company, it is stated that "said assessment is erroneous by reason of over-valuation and the extent of such over-valuation is $17,829,160." Can you recall now, Mr. Carter, any facts by which you can state how you arrived at that later figure which I have just named of $17,829,160 as being the excess over the true valuation of your special franchises for the year 1904?

A. In the first place I assume that the question carries the same modifications as in all previous instances where you present a copy, assuming the copy to be correct?

Q. Yes.

A. Assuming it to be correct I have no doubt the stated excess is as it was given in my statement. It was arrived at I presume in the same manner as in previous years and other years to which you have referred. The excess of the assessed value over the value of the tangible property is given in the special franchise tax report.

Q. In other words, they had imposed a tax of $21,900,000 and you claimed that that was $17,829,160 in excess of the proper valuation. In other words, you claimed that the true value was $4,070,840?

A. For the purposes of taxation, yes.

Q. That was for the year 1904?

A. That was for the year 1904.

Q. The original assessment for that year was $22,000,000, and in the complaint filed with the State Board you claimed that was $18,129,160 in excess of the true value, or that the true value was $3,870,840?

A. Well, you are reading from a document there. If it so appears in the original unquestionably that is the case.

Q. And you are not able now, as I understand it, to state 4244 why there are these variations from year to year in what you claim to be the true value?

A. None other than I have given. I think that the figures given would be found each year in the report of the company to the State Board of Tax Commissioners.

Mr. **Burr**: I will offer this for identification, being similar petition for the year 1904.

Marked City's Exhibit 67 for identification.

Q. I call your attention to page 30 of Yalden's report already in evidence in this case and point out to you as appears in the table on said page that the $7,781,000 to which you have referred, and which appears upon Schedule D in this case as being the value of the contracts, rights and franchises of the Consolidated Gas Company in 1884, was apportioned as follows among the constituent companies:

New York	$1,417,000
Manhattan	2,329,000
Metropolitan	1,863,000
Municipal	1,175,000
Knickerbocker	528,000
Harlem	469,000

In other words, the valuation of the franchise claimed to be held by the New York is 18.2 per cent. of the total amount; of the Manhattan is 29.9; of the Metropolitan 23.9; of the Municipal 15.1; Knickerbocker 6.8; and the Harlem 6 per cent.; is that not so?

Mr. **Mathewson**: It shows whether it is so or not.

A. I don't know anything about it myself.

Q. Well, if that computation is not correct will you please take the pains to correct it?

4245 Mr. **Mathewson**: No. If that is a matter of argument or computation on your part I do not think this witness should do it.

Mr. **Burr**: You are forgetting this is my witness and I am asking him to do me a favor and not as a matter of right. I ask him if he will be kind enough to compute that and if he finds my figures as I give them incorrect will he be kind enough to correct me, not Mr. Mathewson. You have become so used to this situation, Mr. Mathewson, that you fail to recognize the condition as it exists this minute.

The **Witness**: I will be glad to do that, Mr. Burr.

Q. I call your attention to Exhibit 385 before the so-called Stevens Committee as it appears upon page 2433 of the record in that investigation——

Mr. **Mathewson**: You remember you are examining this witness on direct and not cross-examining him. You also have perhaps lost your bearings a little in presenting various documents.

Mr. **Burr**: Oh, no, not at all.

Q. I call your attention to exhibit 385, which purports to be a statement of the status of the real estate, plant and property, as shown under the following headings on the books of the company and under the heading "As per Schedule June, 1884, Franchises and Rights," which appear to be $7,781,000; is that not correct?

A. That is the case, yes, sir.

Q. And under the column "Additions to November 11, 1884," there is no addition apparent upon this exhibit to the item of "franchises and rights," is that true?

A. That appears to be the case.

4246 Q. So that the status December 31st, 1904, of the franchises appears to be $7,781,000 still in this exhibit, and as to increases under the column "Increase" the same figure appears?

A. No.

Q. No, that is the total. This is the status here. The total is given under the column "November 11, 1884," as $7,781,000 and under the column "Status December 31st, 1904," also the figure $7,781,000?

A. That is the case, yes, sir.

Mr. Burr: That exhibit was introduced by Mr. Mathewson at a hearing before the Stevens Investigating Committee.

Mr. Mathewson: If you want the fact, it has been testified over and over again that there is not the slightest question about it that the rights and franchises have continued at the same figure from 1884 down to this date, at $7,781,000 on the books of the company and in the balance sheet and everywhere else, so far as I know.

Q. Can you state whether in arriving at the proper valuation as your attention has been called to the subject for the years 1903, 1904, 1905, you eliminated the franchises of the New York, Manhattan and Metropolitan Companies?

A. In arriving at the proper values, I did.

Q. Well you have stated the proper valuation of your franchise rights for 1904 for instance at $4,070,840, again at $3,870,840, in 1905 at $4,012,257. I say in arriving at any of these totals did you take into consideration, or in arriving at that figure if you now recollect the fact, that any of the franchises upon which this valuation of $7,781,000 had been fixed in 1884 have since expired?

A. Oh, I am sure that nothing of that sort was considered.

The Witness: Of course, Mr. Burr, in accepting your
4247 phraseology of "proper value" as quoted from that report,
perhaps I ought to qualify that in my answer as the value,
or the amount which, according to our statement, should not be exceeded in valuing the franchises for the purposes of taxation; not a proper value in any other sense.

Q. What I was anxious to get, Mr. Carter, was this. The fact appears to be, and it has been stated several times, that the original amount at which these franchises appear upon your book was $7,781,000, and they still have been carried right along on your books at the same figures. Now, this $4,000,000 in the various complaints you have addressed to the Court and to the State Board of Taxation, you claim, represents your rights in addition to the rights represented by the $7,781,000, is that true?

A. In addition, I should say.

Q. This Exhibit 1 appearing on page 40 of the complainant's affidavits in rebuttal in this case, purporting to be a statement of assets. book values and liabilities, October 31, 1905, was that a statement showing the entire assets of the company? Does that statement contain the item of franchises embraced in the item Plants and Property?

Mr. Mathewson: I object to this as improper in direct-examination, asking the witness whether he swore so and so, or whether it does not appear in some of his affidavits. It is not a matter of any importance in this particular instance, but I do not like to have such a precedent established.

The Master: I will allow it.

Mr. Mathewson: Exception.

A. It does include that item, Mr. Burr.

Q. And I think you stated in your affidavit, made in this 4248 case, on page 31, that all of the assets in that exhibit represents actual value and are in no sense fictitious. I call your attention to the paragraph (handing book).

A. Yes, sir, that is the case.

Q. The figure that you included the franchise at in the statement was $7,781,000?

A. Yes, sir.

Q. On page 27 of your affidavit, Mr. Carter, you quote a statement of the Committee with regard to these franchises.

A. You are referring to the Committee of 1886?

Q. Yes.

A. Reference is made in my affidavit to the report of the majority of the Committee in reference to the valuation placed upon the rights and franchises of the company in 1884. Do you wish me to read the paragraph, Mr. Burr?

Q. I mean to say you quoted that in your affidavit?

A. Yes, I have quoted.

Q. With approval?

A. Yes, sir.

Q. And you still approve that statement?

A. Yes, sir.

The Master: Now, Mr. Burr, I am frank to say that I cannot permit much more of this. It does not seem to me that it is in any sense direct-examination of the witness or part of your case. If you are going to try and prove to me the value of these franchises, that is not the way to do it. If you want to prove that Mr. Carter said something outside of Court, different from what he said here, put in the evidence. How it makes out your case to call him here and put in his opinion of these old affidavits on the record, I do not see.

Mr. Burr: I am trying to arrive——

The Master: I know, but it is virtually cross-examination, as to which the witness has already been examined in chief and on the cross, and you cannot make anything else out of it.

4249 Mr. Burr: I called him for further information on this subject of the franchises, and called his attention to several statements that have been made with regard to the franchises, what they purport to be, and what they claim the valuations are, all depending upon the situation as it changes from year to year. I want to get from Mr. Carter some lucid statement, if I possibly can, of the basis on which they claim these franchises to be worth so much one year and worth so much another year——

The Master: It is not a question of what they claim. You are here to prove what the franchises are worth, and you are proving that these people——

Mr. Burr: I will take their statements for it.

The Master: Your proving that these people have made contradictory statements at some other time does not show what they are worth.

Mr. Burr: I suppose, of course, that you will take notice from what has been presented here in all these various petitions and proceedings, what their claim has been as to what their franchises represent.

The Master: Certainly.

Mr. Burr: And what their value is, and whether they represent tangible or intangible rights. Now there is a statement by Mr. Carter that the $4,000,000 is in addition to the $7,781,000.

Mr. Mathewson: And why not, so long as you represent the State and City, consume some time in reconciling the statements of the State Tax Board that for the purposes of taxation they are worth $31,900,000, but for the purposes of fixing the price of gas, they are worthless and of no value at all?

4250 The Master: What I said was not addressed to the merits of the matter, but as to the manner of proof. I do not think this is proper examination in chief of a witness called by you.

Q. I only want to ask you one question, Mr. Carter. Mr. Zollicoffer and Mr. Gawtrey in 1900 and 1901 were your superiors, were they not?

A. Yes, sir.

Q. Mr. Zollicoffer was secretary and Mr. Gawtrey was president or vice-president, was he not?

A. He was president, yes, sir.

Mr. Burr: That is all I want to ask you now, Mr. Carter.

The Master: You may cross-examine.

Mr. Burr: It is understood that Mr. Carter is to get the statements or data on which these various figures were based, if he can.

Mr. Mathewson: I have not any understanding with him. You can reach any understanding with your own witness that you can. I have no control over him now.

Q. You are not now saying that you are so adadvised by counsel, are you?

A. I may have to later.

Cross-examination by Mr. Mathewson:

Q. Referring to the petitions for a reduction of the franchise assessment or petitions for writ of *certiorari* to review the franchise tax assessments prior to the year 1906, you had not the advantage, had you, of the decision of the Supreme Court of the United States as to the taxation of these franchises, or as to whether they should be taxed at all?

A. That is the case, yes, sir.

4251 Q. And did you not, in these various petitions, or rather the company in these various petitions, raise the question among others, that the act was unconstitutional and that the assessment of these franchises for taxation should be nothing beyond the mere tangible property?

A. That I understand to have been the theory in a general way, Mr. Mathewson.

Q. And did you not also raise the question specifically in these petitions that these taxes as assessed were unequal and discriminatory as against the Consolidated Gas Company as compared with other real estate?

A. That question was raised, yes, sir.

Q. And did all these facts enter into the form of the petitions as presented, and the substance of those petitions?

A. Yes, sir.

Mr. Burr: You mean all these claims?

Mr. Mathewson: All these considerations.

Q. Now, if you look at page 402 of the Exhibit book, Schedule D, it appears that the tangible property in the streets, that is, mains, was specified at how much for the year 1905, in the report to the State Tax Board?

A. The report appearing upon the page that you give me, Mr. Mathewson, is for 1904.

Q. Well, 1904?

A. Would you like me to find 1905?

Q. No, that will do.

A. In 1904 the valuation was given as $4,261,156.39.

Q. Now, in the petition for reduction in the year 1905 for the 1905 taxes, City's Exhibit 64 for identification, it appears that the company states that the special franchises should be assessed at only $4,261,156, which is the identical amount, is it not?

A. That is the case, yes, sir.

4252 Q. In other words, that is just the value of the tangible property as fixed in that report?

A. As fixed in that report, yes, sir.

Q. Now, do you know how that sum of $4,261,156 was arrived at, except from Mr. Simpson's testimony that that represented bare cost of material plus labor in laying in soft dirt?

A. I have no other information than that and there is none to be had but that.

Q. Did you know that the charter of the City of New York provided that in the assessment of real estate an amount should be placed opposite the real estate at which it would in ordinary circumstances sell?

A. Yes.

Q. And not in its original cost?

A. No, sir.

Q. Nor its structural value?

A. No, sir.

Q. Nor its cost of reproduction?

A. No, sir.

Q. And did you know that under the Franchise Tax Act that these special franchises and also the mains and services were defined as real estate?

A. They were so defined, yes, sir.

By Mr. **Burr**:

Q. Did you know that they were so defined?
A. I know that they were, yes, sir.

By Mr. **Mathewson**:

Q. And were you so informed by counsel at that time?
A. Yes, sir.
Q. What is your view that these franchise rights, if sold in ordinary circumstances and separate from the tangible property of the company would bring their actual value as to an operating company?
A. Decidedly not. They might bring no value whatever; there might be no bidders for them whatever under those conditions, whereas, as an asset of a going concern they might have a very large value.

4253 Q. And is the same true of mains and services?
A. Identically.

Mr. **Burr**: I object to that and ask you to have those answers stricken out, as being purely speculative. There has been no evidence here that any such condition was existing.
Mr. **Mathewson**: You asked the theory on which this witness arrived at this particular transaction or the company did.
Mr. **Burr**: I asked him but he said he did not know and has no data to find out.
The **Master**: I will allow it.
Mr. **Burr**: Exception.

Q. When you say that the Supreme Court of the United States confirmed the assessment of about $14,000,000 against the special franchises of the company by their decision between your 1905 and 1906 reports, is it not true that that proceeding went through the courts of the State of New York, including the Court of Appeals as well as the Supreme Court of the United States?
A. That is the case, yes, sir.
Q. And were you successful in reducing the assessment?
A. We were not, and have never been.
Q. And did not that apply to an early tax, say, the tax for the year 1899?
A. Yes, sir.

Mr. **Burr**: What applied?
Mr. **Mathewson**: The $13,000,000 or $14,000,000 assessment.

Q. Now, it has been drawn to your attention that following your petition in the year 1905 to reduce the assessment of your special franchises from $30,500,000 the Board actually reduced the assessment to $27,300,000?
A. Yes, sir.

4254 Q. Did the Board under your 1906 petition reduce your assessment of special franchises a dollar below the $31,900,000 at which they fixed the tentative value?

A. Not a dollar.

Q. And this petition in 1906 and the decision of the Board of 1906 was subsequent to the finding of the Supreme Court of the United States that the Franchise Act was constitutional, was it not?

A. Yes, sir.

Q. Now, I want to ask you whether these various subjects and considerations to which Mr. Burr has called your attention modify in any way the testimony which you have heretofore given as to the cost of any property of the company?

A. No, sir.

Q. Nor its cost of reproduction?

A. No, sir.

Q. Or its present structural value?

A. In no respect.

Q. Is it not true, Mr. Carter, that as secretary of the company you are called upon to sign from time to time large numbers of papers which you yourself do not prepare?

A. Yes, sir.

Q. And of which you are only generally informed?

A. That are prepared by counsel and submitted to me for official signature, very frequently.

Q. Now, it has been called to your attention that the $7,781,000 of value in franchises with which the company started in 1884 was divided among the six companies at the time of consolidation for some purpose in a certain proportion. Is not that in accordance with the sales of the various companies, if you remember?

Mr. Burr: I object to that unless this witness knows of his own knowledge.

Mr. Mathewson: That is what I am trying to ask him, if he remembers.

Mr. Burr: I think he has already testified that he does not.

The Master: He can say, if he can remember.

4255 The Witness: My impression is that it recognized the ratio of the volume——

Mr. Burr: I object to his stating his impression. He asked for facts, and I insist upon him giving them.

Mr. Mathewson: I asked for his best recollection.

The Witness: My recollection is that it recognized the ratio of the volume of business of the companies, the ratio of the total.

Q. Will you look at this affidavit in rebuttal to which Mr. Burr called your attention and show me the paragraph to which he drew your attention and asked you if you did not quote and if you believed that to be the fact?

A. On page 27 of my affidavit in rebuttal——

Mr. Burr: Embracing——

Q. No, no, the report of the Committee of 1886, that is what you asked him, if it was not a report. Will you please read the paragraph to which attention was drawn and which you did quote?

Mr. Burr: I have no objection to his reading that paragraph, provided he commences from the paragraph to which I referred, that is the statement made by him with regard to the paragraph he is now proceeding to quote.

Mr. Mathewson: You drew no attention to it.

Q. Very good, you may read that paragraph. What did you say in your affidavit preceding the paragraph which you quoted from the Commission's report?

A. After referring to the character of the franchises, "Including
the privilege of laying their mains in the King's Highway"
4256 and their recognition by the Court as probable, the Com-
mittee goes on.

Q. Now, will you quote the paragraph of the Committee's report?

A.—

"Thus the question for your Committee to decide was this, was the $7,781,000 more than the fair aggregate value of the franchises and rights of these six companies? We are forced to the conclusion that it was not; that the franchises of the New York, Manhattan, Metropolitan and Municipal Companies were worth much more than that sum, and that if these companies saw fit to give a part in their franchises to the stockholders in the Harlem and Knickerbocker companies, it was a matter which interested only the stockholders of these companies."

Q. Now, the Committee's finding, therefore, that $7,781,000 was much less than the value of the franchises referred to the franchises of only four of the companies, did it not, out of the six?

A. That is the case, yes, sir.

Mr. Burr: I object to that. The Committee's report speaks for itself. The witness's characterization of it is not proper.

The Master: That is right, if he is asked to characterize it; but if it is before him, and he is asked to state what it contains that is only in line with the great majority of the questions you asked him about these exhibits for identification.

Mr. Burr: Yes, he may state what it contains without characterizing it.

Mr. Mathewson: That is it exactly; I am not asking for information outside of that.

The Witness: Only the franchises of the New York, Manhat-
tan, Municipal and Metropolitan are stated, and it is stated
4257 that their value is more than the sum at which the value of all
the franchises——

Mr. Burr: The inference is that the other two franchises were worth nothing.

Q. And those four companies do not include the Harlem Company, do they?

A. No, sir; nor the Knickerbocker.

Q. And is it not the claim of the Consolidated Gas Company that the Harlem has a perpetual franchise above 79th street for the whole city?

A. Yes, sir.

Q. And does it in your opinion follow that if some of the franchises at present have expired, without conceding that fact, that the balance of the franchises now are worth less than $7,781,000?

A. Well, hardly, no, sir.

Q. In connection with these various petitions to which your attention has been called, I want to ask you whether when you signed them it was your understanding that those petitions, dealing with valuations for taxations, stated the original cost of the property with which you were dealing or the cost of reproduction or the actual structural value of the property to the company as a going concern?

A. No, sir.

Redirect-examination by Mr. Burr:

Q. Then you have some recollection independent of the data as to what you meant by these various figures that you adopted and stated in these various papers to which I called your attention?

A. I think I stated so in reply to your question, Mr. Burr.

Q. And Mr. Mathewson has asked you if you are not in the habit of signing a great many papers without knowing exactly what they are, papers presented by counsel?

A. No, I don't think he answered the question in that way.

4258 Q. I understood the inference was that you might not have known exactly what you signed in those papers. You do not mean to make any such claim, do you?

A. Perhaps it would be well to have Mr. Mathewson's question read and my reply, so I would know exactly what I did testify.

Q. When you sign a paper and you swear in that to your special knowledge of the matter that that paper purports to refer to, you mean exactly what you say, do you not, in that affidavit?

A. Yes, sir. But there are a great many affidavits which come to me that I do not have opportunity or time to study very closely or very carefully, and I am therefore obliged to depend a great deal upon counsel, and do so.

Q. I called your attention to your affidavits attached to these petitions in which you stated you had special knowledge in regard to these special subjects and transactions and I asked you, quoting the statements, if those statements were true at the time you signed those affidavits and you stated they were and that they were true today?

A. I might add that most of my knowledge on that subject would be such as I derived from counsel in the proceedings.

Q. What did you mean by using the words "Special franchises" in verification of the 1905 and 1906 complaints?

A. The understanding of the term, "Special fra-chise"?

Q. Yes.

A. Why, it was a name given by the Act of the Legislature to our right to occupy the streets and to the tangible property in the streets, that is my understanding of it.

By Mr. Mathewson:

Q. You know that in the present charter of the City, the Greater

4259 New York Charter, there are limitations respecting the granting of franchises, making them more difficult to obtain and providing that they shall be limited to 25 years and so on?

A. Yes, sir; that there are such limitations and that the value of existing franchises must be therefore greatly enhanced.

By Mr. **Burr**:

Q. May I ask one question of Mr. Carter. I want to call your attention to City's Exhibit 55, being a statement appearing in the Tribune of April 15th, 1904, and ask you whether you know that that was an official statement issued by the Consolidated Gas Company at that time?

A. I know nothing about it, Mr. Burr, whatever. I should say it was not an official statement because as such I should expect to have some knowledge of it. As I have not, I am forced to the conclusion that it is not.

Q. Are you acquainted with Mr. Harry C. MacDona?

A. No, sir; I do not recall ever having met him. I know him by reputation and by name, but that is the extent of my acquaintance or knowledge of him.

Q. Is he not entered on the books of your company as an employee?

A. His name appears as a special counsel with a retainer; not I should say as an employee, but his name appears for convenience sake on the pay-roll.

Q. Was he not an employee of the Consolidated Gas Company on April 15th, 1904?

A. That I am unable to say without—I can find that out for you, but I really do not know.

Q. Do you mean to say, Mr. Carter, that that statement in the Tribune or in any of the papers of that date was never called to your attention heretofore?

4260 A. It was in connection with this case, because I understood you had asked some question about it and I read it then for the first time.

Q. Do you know whether any disavowal of that statement was ever issued by the Consolidated Gas Company?

A. I have no knowledge of the original publication of it, nor have I of any disavowal of it.

By Mr. **Mathewson**:

Q. You have seen a great many things published respecting the Consolidated Gas Company which were not so and which you have never seen any official disavowal of?

A. I should say so. We carefully avoid all disavowals and all other newspaper discussion.

Q. I will ask you whether Mr. MacDona, so far as you know, was ever granted authority to outline the position of the company?

A. I am sure he was not, because there has been no record of it, and if he had been there would have been such a record.

By Mr. **Burr**:

Q. Was not this statement to which I called your attention appearing in the Tribune on the 15th of April, 1904, the day immediately preceding the public hearing before the Mayor on the Remsen Gas Bill, April 16, 1904?

Mr. **Mathewson**: I object to that as immaterial.

A. It is a question of dates. This is unquestionably April 15th. If you can say that the hearing before the Mayor was on April 16th, I should have to testify it was the day before, but that would be all.

Q. You have no special knowledge about the date of that public hearing?

A. None whatever.

4261 & 4262 Q. But that was the date of it just the same.

Mr. **Mathewson**: Well, you do not want to testify to that?

Mr. **Burr**: That was the date of the hearing. The Court will take judicial notice of that.

Adjourned at 4:45 P. M. to Tuesday, November 27, 1906, at 10:30 A. M.

Last Exhibits:

Complainant's 256.
State's, YY.
City's, 67.

4263 Circuit Court of the United States, Southern District of New York.

Consolidated Gas Company of New York, Complainant,

vs.

Julius M. Mayer, as Attorney General of the State of New York; William Travers Jerome, as District Attorney of New York County; Frederick E. Gunnison, John C. Davies, and Lucian L. Shedden, Constituting the New York State Commission of Gas and Electricity, and The City of New York, Defendants.

Before Arthur H. Masten, Special Master.

New York, Tuesday, *November* 27, 1906.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Page, Mr. Freedman.

4264 Mr. **Burr**: While I intended to, it seems I did not take an exception to your Honor's ruling that I was bound to call Mr. Carter as my own witness, on page 4216. I will now take an exception.

The **Master**: Note an exception.

Mr. **Burr**: Continuing on the subject of franchises, to which I called Mr. Carter's attention yesterday, I desire to read into the record extracts from the testimony of Harrison E. Gawtry, President of the Consolidated Gas Company, the complainant herein, as the same appears in the printed report of the case entitled "The People of the State of New York *ex. rel.* Consolidated Gas Company of New York, respondent against State Board of Tax Commissioners, appellants; John Cunneen, Attorney for Appellants; Messrs. Boardman, Platt & Solely, attorneys for Relator-Respondents. This record is the printed record in the Court of Appeals.

I read from the same as contained in the printed volume in the Law Institute entitled Cases in the Court of Appeals, special franchise tax cases. July 1902-July, 1903. Volume 2127. I read from page 35 of the printed record:

"HARRISON E. GAWTRY, sworn for the plaintiff, testified:

Examined by Mr. PLATT:

Q. Where do you reside? A. No. 18 West 11th Street, New York.

Q. You are the President of the Consolidated Gas Company? A. Yes, sir.

Q. How long have you been president of that company? A. Since January, 1894."

Mr. BURR: On page 38:

"Mr. PLATT: In the return to the writ of *certiorari* in this 4265 case appears the following sentence: 'That, among other things, respondents ascertained that the relator had heretofore claimed the value of its franchises to be upward of $7,000,000.' I want to ask if counsel himself can tell me what is referred to in that sentence?

Mr. FIERO: That is an application which was made for reduction of assessments, I think, in 1899, to the Local Board of the City of New York, where it was set out for the purpose of obtaining a reduction that the franchises were worth $7,000,000. We shall want to present that document sooner or later.

Q. You understand that that statement in the return refers to a statement which was made in the annual tax statement of the company to the New York City Department of Taxes and Assessments for 1899? A. Yes, sir.

Q. That was made on the blank of the New York City Tax Department, in accordance with their requirement? A. Yes."

Mr. BURR: On page 41:

"Q. What did that $7,781,000 represent? A. It represented the good will of the Consolidated Company; the right to exist as a corporation; contracts with the City, etc.

Q. The right to make and sell gas? A. Yes, sir.

By the REFEREE:

Q. The right to occupy the streets, I suppose; was that included? A. Yes, sir.

By Mr. Platt:

Q. In making the returns to the Tax Commissioners, did the $7,781,000 have reference to the franchise? A. To all those items.

Q. In fact, everything that the company had except the tangible property? A. Yes, sir.

4266 Q. The company made on Form 2 of the State Board of Tax Commissioners, under date of December 20th, 1899, a supplemental report, showing the cost of reproduction of the tangible property in the streets; it shows the cost of reproduction at $4,100,364.93; the statements in this report are true? A. Yes, sir.

Q. Is that cost of reproduction of the pipes and tangible property in the streets made up on the basis of new pipe? A. What new pipes would cost."

Mr. Burr: And continued on page 42:

"Q. Of the same diameter and same length put down would cost? A. Exactly.

Q. That is, what would it cost to put them down at the time the report was made up? A. Yes, sir.

Q. That did not then represent the actual value of the pipes as they stood in the street at that time; did not represent the cost of putting them in new? A. At that time.

Q. What reduction would you make, from your knowledge as an expert in the business, for depreciation? A. I should say all the way from 10 to 20 per cent.

Q. A great many of these pipes of the company had been down a great many years? A. Yes, sir.

Q. Going back for how long a period? A. Sixty years.

Q. Varying all the way from sixty years down to date? A. Yes, six months.

Q. You think it is at least 10 per cent.? A. I should say 10 per cent. was a very conservative estimate.

Q. The pipes and property in the streets was assessed the
4267 previous year by the local assessors at $5785,000; how do you
explain the difference? A. The first year that mains were taxed as real estate the local assessors fixed a valuation per foot for each size named, as I understand it, and that has never been varied, and as additional mains have been laid from year to year the report has been made to the department, and the tax has been fixed upon the old estimates of the cost per foot.

Q. Has the cost of construction decreased since that time? A. I should say at least 25 per cent."

Mr. Burr: Also on page 43:

"Q. I understood you to say in arriving at the value of the tangible property in the streets for the purpose of these reports no allowance was made for the depreciation by reason of age. A. I don't think there was.

Q. Who made up those figures? A. Mr. Zolikoffer, the secretary of the company.

Q. Did you assist in the preparation of those figures? A. No, sir."

Mr. Burr: And on page 44:

"Q. Then you have no personal knowledge on that subject? A. On the special subject; no, sir.

Q. You don't know whether any such allowance was made or not? A. I do not."

Mr. Burr: On page 45:

"Q. A question or two about this item of $7,000,000, which you explained on your direct examination; that you say in 1884 represented what? A. It was put down for the good will of the 4268 constituent companies, any contracts they might have had and did have with the City, the right to exist as a corporation.

Q. In short, all of their intangible property; it included all their franchises, did it not? A. It included everything.

Mr. Burr: And on page 46:

"Q. Have there been any new franchises conferred upon this company since 1884? A. No.

Q. So whatever franchises you had then you have now? A. Yes, sir."

Mr. Burr: Page 47:

"Q. They have asked you concerning an estimate made about the franchises of this company in this blank to the City of New York authorities; you don't regard the value of the franchises of a company fluctuating with the value of the stock, do you? A. No, sir."

Mr. Burr: Page 49:

"Q. What was the value of the stock of this company on the second Monday of January, 1900?

Objected to as incompetent, immaterial and irrelevant; objection overruled; exception.

A. I cannot state the value of the whole stock of the company at the time stated. On Monday, January 8, 1900, according to the best reports I have been able to obtain of transactions on the New York Stock Exchange, 387 shares of the stock of the Consolidated Gas Company were sold at $193 per share; this price was not representative of the value of the whole stock of the company, but merely represents the amount that speculators on the Exchange were 4269 willing to pay on that day for that number of shares; the stock was being speculated in about that time, and the stock varied according to the speculative demand and supply very largely, from about 160 to 220 or 230; it would be impossible to estimate the value of the whole stock of the company, or any large amount thereof, from the sales of the Stock Exchange on any particular day; if any large amount of stock were offered on the market at one time, undoubtedly the price would decline largely and *vice versa,* and if the whole capital stock were offered, it is doubtful whether there would be any market for it; certainly no one can state what the value would be."

Mr. Burr: When Mr. Carter procures the data which I have asked him for, I propose to examine him in regard to that further. That is all I have at present on the question of special franchises.

Mr. Burr: Mr. F. Augustus Schermerhorn appears here in pursuance to a subpœna, and at the request of Mr. Mathewson we stipulate that he may appear at eleven o'clock on Monday.

Mr. **Mathewson**: No, do not put it at the request of Mr. Mathewson it is stipulated he may appear here on Monday at eleven o'clock, or any other time.

Mr. **Burr**: What do you desire to do, Mr. Mathewson?

Mr. **Mathewson**: I am not prepared to make any stipulation respecting it. The witness says he will come later, if you want him.

The **Master**: That ought to be sufficient for your purpose, Mr. Burr. Excuse him until Monday.

Mr. **Burr**: Well, you are excused until Monday, Mr. Schermerhorn.

4270 We will now take up the subject of marginal streets, and Mr. Freedman of our office will present the evidence for the city in that regard.

Mr. **Freedman**: The title to all the lands under water from high water mark out into the North, East and Harlem Rivers was vested at a certain time in the Mayor, Aldermen and Commonalty of the City of New York under the ancient charters and statutes of the Legislature.

Mr. **Mathewson**: I must object to this, Mr. Master, as being conclusions of the witness. It seems to me that the documents, and so on, that contain this are the best evidence.

Mr. **Burr**: You have the documents, have you?

Mr. **Freedman**: I have.

Mr. **Burr**: Well, produce the documents, please, to justify any statements you make.

The **Master**: That is hardly the way to prove title, Mr. Burr. If he makes any claim about the title, introduce the grants and statutes in evidence in the ordinary way.

The **Witness**: I offer in evidence the Dongan Charter of 1683, with special reference to Section 3, contained on page 198 of David T. Valentine's compilation of the laws of the State of New York, relating particularly to the City of New York, which is as follows:

"And I do, by these presents, give and grant unto the said Mayor, Alderman and Commonalty of the said City of New York, all the waste, vacant, unpatented and unappropriated lands, lying and being within the said City of New York, and on Manhattan's Island aforesaid, extending and reaching to the low water mark, in, by and through all parts of the said City of New York, and Manhattan's Island aforesaid, together with all rivers, rivulets, coves, 4271 creeks, ponds, waters and water courses in the said City and Island, or either of them, not heretofore given or granted."

Received in evidence as City's Exhibit 68, but not marked.

Mr. **Freedman**: We offer in evidence the Montgomery Charter of 1730, and refer particularly to Section 37, contained on page 244 of the same compilation, consisting of a confirmation of the Dongan Charter in words and language as follows:

"And also to make laws and rules for the governing and well ordering of all the ferries now erected or established, or hereafter to be erected or established round the said Island of Manhattan's, and all the waste, vacant, unpatented and unappropriated lands lying and being within the said City of New York and on Manhattan's Island aforesaid, extending to low water mark."

And also to Section 38, contained on page 245 of the same compilation, as follows:

"And also, we do further, of our special grace, certain knowledge and me*er* motion, give, grant, ratify and confirm unto the said Mayor, Alderm*an* and Commonalty of the City of New York and to their successors forever, all that space of ground and soil of Hudson's River now lying and being under the water of the same river, to begin at a certain place near high water mark near the south end of a piece of up-land, which lies between the said river and a piece of meadow ground or marsh, being the first piece of meadow ground
or marsh near Hudson's River, to the southward of Green-
4272 wich, and from whence the above named run of water called
Bestaver's Killitie or Rivulet, runs into Hudson's River, from
which place of beginning to extend or run to the south side of the street, which runs from the parade before our fort in New York to Hudson's River, south 18 degrees, 30 minutes west, on a straight line, the distance being 125 chains, from which line to run a perpendicular breadth of, and to comprehend 400 feet from low water mark into Hudson's River, the same containing 82 acres and one-half acre or thereabouts. And also, all that space of ground and soil of the East River, from the north side of Corlaer's Hook to Whitehall, beginning at two large stones set on the south side of a small creek, in a marsh on the north side of Corlaer's Hook; from whence to the easter-most point of Corlaer's Hook, the distance on a straight line running south 15 degrees, 30 minutes east, is 40 chains and two rods; from thence to Whitehall, on a straight line, running south, 78 degrees, 30 minutes west, the distances is 152 chains, from which two lines to run a perpendicular breadth of, and to comprehend 400 feet from low water mark into the East River, the same containing 127 acres or thereabouts."

Received in evidence as City's Exhibit 69, but not marked.

Mr. **Freedman**: From Kent's Comments on the Charter and Rights of the Corporation, it appears that Bestaver's Killitie, from the best information obtainable, was located on or about the foot of Charlton Street, North River.

The defendant, the City of New York, offers in evidence Chapter 584 of the laws of 1732, contained on pages 250 and 251 of the
same compilation, and especially refers to the third section
4273 thereof. That is, the act confirming the two charters, the
1730 Act, the Montgomery Charter and the Dongan Charter,
and it is as follows:

"And be it enacted by the authority aforesaid, that all and singular letters patent, grants, charters, and gifts, sealed under the great seal of the Colony of New York, heretofore made and granted unto the Mayor, Aldermen and Commonalty of the City of New York, and are to all intents and puropses, hereby ratified and confirmed."

Received in evidence as City's Exhibit 70, but not marked.

Mr. **Freedman**: I offer in evidence Chapter 115 of the Laws of

1807, and especially refer to Section 15 thereof, found on page 808 of the same compilation, which is as follows:

"And whereas, for the purpose of duly regulating and construct*ion* slips and basins, and for running out wharves and piers, it is essential that the right to the land under water, below low water mark, should be vested in the corporation of the City of New York.

Be it therefore further enacted, that it shall and mav be lawful for the Commissioners of the land office, and they are hereby directed to issue letters, patent, granting to the Mayor, Aldermen, and Commonalty of the City of New York, and their succesors forever, all the right and title of the people of this State to the lands covered with water, along the easterly shore of the North or Hudson's River, contiguous to and adjoining the lands of the said Mayor Aldermen and Commonalty, within the said City of New
4274 York, at and from low water mark, and running four hundred feet into the said river from Bestaver's Killetjie or River, to the distance of four miles to the north along the easterly shore of the said North or Hudson's River; and also all the land covered with water, along the westerly shore of the East River or Sound, contiguous to and adjoining the lands of the said Mayor, Aldermen, and Commonalty, at and from low water mark, and extending 400 feet into the said river, or Sound, from the north side of Corlear's Hook, at the northerly boundary of the lands covered with water, whereof the said Mayor, Aldermen and Commonalty are now seized, to the distance of two miles to the north, along the westerly shore of the said East River, or Sound; Provided always, that the proprietor or proprietors of the lands adjacent shall have the pre-emptive right in all grants made by the corporation of the said City, of any lands under water granted to the said corporation by this Act."

Received in evidence as City's Exhibit 71, but not marked.

Mr. Freedmen: I offer in evidence certified copies of letters patent granted under and pursuant to the provisions of said Act.

Received in evidence and marked City's Exhibit 72.

Mr. Freedman: Defendant offers in evidence Chapter 58 of the Laws of 1826 and especially refers to the 1st Section thereof, which is as follows:

"Be it Enacted by the People of the State of New York,
4275 represented in Senate and Assembly that it shall and may be lawful for the Commissioners of the Land Office, and they are hereby directed to issue letters patent, granting to the Mayor, Aldermen, and Commonalty of the City of New York, and their successors forever, all the right and title of the people of this State to the lands covered with water along the easterly shore of the North or Hudson's River, contiguous to and adjoining the lands of the said Mayor, Aldermen and Commonalty within the said city of New York at and from low water mark, and running 400 feet into the said river, from a point on the easterly shore of said river, four miles north of Bestaver's Killitje, and extending therefrom north along the easterly shore of said river, to Spyden Duyvil Creek, otherwise called Kingsbridge Creek or Harlem River; and also all the land covered with water along the westerly shore of the East River or

Sound contiguous to and adjoining the lands of the said Mayor, Aldermen and Commonalty, at and from low water mark, and extending 400 feet into the said river or sound from a point on the westerly shore of said river or sound two miles north fr-m Corlaer's Hook and extending therefrom north along the westerly shore of the said East River or Sound, to Spyden Duyvil Creek, otherwise called Harlem River: provided always that the proprietor or proprietors of the lands adjacent, shall have the pre-emptive right in all grants made by the corporation of the said city, of any lands under water granted to the said corporation by this Act."

Received in evidence as City's Exhibit 73, but not marked.

4276 Mr. Freedman: I offer in evidence letters patent issued under and in pursuance of said Act, conveying the property therein described.

Received in evidence and marked City's Exhibit 74.

Mr. Freedman: I offer in evidence Chapter 166 of the Laws of 1826, and refer particularly to the first section thereof, contained on page 825 of the same compilation, which is as follows:

"Be it enacted by the People of the State of New York, represented in Senate and Assembly, that Tompkins Street, along the East River, as laid out and approved by the Mayor, Aldermen, and Commonalty of the City of New York, shall be the permanent exterior street on the East River, between Rivington Street and 23rd Street; and East Street on the said river, between Grand Street and Rivington street, as laid out and approved as aforesaid, shall be the permanent exterior street, as so laid out and approved; and that all grants made or to be made by the said Mayor, Aldermen, and Commonalty shall be construed as rightfully made to extend thereto; and that all the provisions of the Act, entitled 'An Act to reduce several laws relating particularly to the City of New York into one Act,' passed April 9, 1813, and the several Acts amendatory thereof and in addition thereto, shall be construed to apply to said Tompkins Street and East Street."

Received in evidence as City's Exhibit 75, but not marked.

4277 Mr. Freedman: Defendant offers in evidence map produced from Department of Public Works, City of New York, bearing endorsement in blue lead pencil, "East River shore, Corlaer's to 28th Street, March 7, 1825;" and it bears the endorsement on the front of it, "In Common Council, March 7, 1825, upon the report of the Finance Committee on recommendation of Peter G. Stuyvesant, this map was presented and was accepted and approved by the Board. J. Martin, Clerk;" the map being of Tompkins Street, and especial reference being made to that portion of the map which shows Tompkins Street between 12th and 16th Streets. An extract from such map will be furnished to the attorney for the complainants.

Mr. Mead: Do you claim that this map proves itself?

Mr. Freedman: I think so, under the Common Council endorsement, and as an ancient document.

Mr. Mead: You have not proved that endorsement.

Mr. Freedman: It is right on the face of it.

Mr. **Mead**: It does not appear where the map came from.

Mr. **Freedman**: We produced it from the Department of Highways, as stated.

Mr. **Mathewson**: The complainant produced certain ancient transfers and assignments relating to said grants signed by Okie Hall and others, which I understand the City does not admit, although the signatures are well known. Accordingly, we will not admit the signatures on this map, but we are willing to reciprocate if ours are admitted.

Mr. **Burr**: The grants to which Mr. Mathewson has made reference have not been accepted because they are mutilated, and the mutilation is apparent upon their face, and they are improperly acknowledged, and that is apparent upon the face of them.

Mr. **Mathewson**: This map is not acknowledged at all.

Mr. **Burr**: I offer this map in evidence.

Mr. **Mathewson**: I object to it as not proven.

4278 Mr. **Freedman**: Mr. Hatton is right here, and can testify he brought that down from the department.

The **Master**: It is understood that the map came from the proper custody, of course. Mr. Hatton may be called later, so as not to interrupt the orderly procedure.

Mr. **Mead**: I think it should appear it has been in that custody thirty years.

Mr. **Freedman**: No, twenty years, under the Section of the Code.

Objection overruled; exception.

Received in evidence as City's Exhibit 76, but not marked.

Mr. **Freedman**: We offer in evidence Chapter 182 of the laws of 1837, on page 842 of the same compilation, and particularly refer to Sections One and Three of the same, which are as follows:

"**Section** 1. The Thirteenth Avenue, as laid out on a map made by George B. Smith, City Surveyor, bearing date March 10th, 1837, and approved by the Mayor, Aldermen and Commonalty of the City of New York, by a resolution passed in Common Council, on the 28th day of March, 1837 (which map is filed in the office of the Street Commissioner of the City of New York), shall be the permanent exterior street or avenue in the said city along the easterly shore of the North or Hudson River, between the southerly line of Hammond Street and the northerly line of 135th Street."

* * * * * * *

"**Section Three.** The Mayor, Aldermen, and Commonalty of the City of New York, shall be, and they are hereby, vested with all the right and title of the People of this State, to the lands 4279 covered with water along the easterly shore of the North or Hudson's River, between Hammond Street and 135th Street, and extending from the westerly side of the lands under water, heretofore granted to said Mayor, Aldermen, and Commonalty of the City of New York, by letters patent, in pursuance of the Act, Entitled 'An Act Relative to Improvements in the City of New York,' passed February 25, 1826, to the westerly side of the said Thirteenth Avenue. And the said letters patent shall be construed so as to grant to the said Mayor, Aldermen and Commonalty of the City of

New York, and their successors forever, the said lands under water easterly of the westerly line of the said Thirteenth Avenue."

Received in evidence as City's Exhibit 77, but not marked.

Mr. Freedman: I offer in evidence a map entitled "A Map showing the projected exterior line of the City of New York extending along the Hudson River from Hammond Street to 135th Street."

The name Hammond was changed to West 11th Street. It is signed, "New York, March 10, 1837, George B. Smith, City Surveyor," and especial reference is made to that part of the map which lies between 41st and 46th Streets westerly of 11th Avenue.

Mr. Mead: Do you offer the whole map? There is a whole lot in there as to ownership.

Mr. Freedman: No; as to 13th and 12th Avenues.

Mr. Mathewson: Same objection to this map as to the offer of the preceding map.

The Master: It will be received on the same understanding. Exception.

Received in evidence as City's Exhibit 78, but not marked.

4280 Mr. Freedman: This map is approved by the 1st section of the Act which recites the Act under which it was made, that the map made by George Smith, bearing date March 10th, 1837, and approved by the Mayor, Aldermen and Commonalty of the City of New York, by a resolution passed in Common Council, on the 28th day of March, 1837 (which map is filed in the office of the Street Commissioner of the City of New York), shall be the permanent exterior street or avenue in the said City along the easterly shore of the North or Hudson River, etc.

Mr. Mathewson: And how is it proved by the map?

Mr. Freedman: We give the title, we give the date, we give the distance, which shows that it is the very map referred to in this section.

Mr. Mathewson: No, there is no evidence that this is that map yet.

The Master: That is a matter of argument. Proceed.

Mr. Freedman: We offer in evidence Chapter 285 of the Laws of 1852, at page 859 of the same compilation, which authorizes the City to lay out and fix the permanent exterior street on the Harlem River, passed April 14, 1852, which is as follows:

"The People of the State of New York, represented in Senate and Assembly, do enact as follows:

"Section 1. It shall be lawful for the Mayor, Aldermen, and Commonalty of the City of New York to lay out and fix a permanent exterior street, along the shore of the Harlem River in the City of New York, between the East River or Sound and the North or Hudson River, and to cause a map thereof to be made; and which map, when approved of and ratified by the said the Mayor, Aldermen, and Commonalty, shall be filed in the office of the Street Commissioner of said City. 4281

Section 2. The several streets and avenues of said city, as laid out on the map or plan made by the commissioners appointed by the Act entitled 'An Act relative to improvements touching the laying out of streets and roads in the City of New York, and for other purposes,' passed April third, eighteen hundred and seven, or as subsequently established by law, shall be continued and extended along the present lines thereof, from their present terminations on the said map or plan respectively to the said exterior street and permanent line.

SECTION 3. The mayor, aldermen, and commonalty of the City of New York shall be, and they are hereby, vested with all the right and title of the people of this State to the lands covered with water along the shore of the said Harlem River, from the East River or Sound to the North or Hudson River, and extending from low water mark to and including the said exterior street or permanent line.

SECTION 4. The proprietors of all grants of land under water, or owner or owners of all lands adjacent to those hereby granted, shall have the pre-emptive right in all grants which may be made by the said, the Mayor, Aldermen, and Commonalty of the City of New York, if any, of the lands under water granted to them by this act, adjacent to and in front of the said lands under water heretofore granted by the said the Mayor, Aldermen, and Commonalty of the City of New York.

SECTION 5. This act shall take effect immediately."

Received in evidence and marked City's Exhibit 79, but not marked.

4282 Mr. FREEDMAN: We produce in evidence a map entitled, "A Map of the Exterior Street in the City of New York Along the Shore of the Harlem River from 89th Street on the East River to the North or Hudson River, laid down in conformity with the exterior line as established by the Harbor Commissioners by virtue of the Act of the Legislature passed April 15, 1857; survey, in accordance with a resolution of the Common Council approved 1858, made by H. L. Southward, City Surveyor, 1858/9."

It bears the endorsement also, "E. A. T., September 12, 1859, Street Commissioner H. F. K. Received, Street Commissioner's Office, 10th September, 1859, M. Lully (?), Deputy Street Commissioner;" also the endorsement: "Adopted by the Board of Aldermen, September 26, 1859, adopted by the Board of Councilmen, October 20, 1859, approved by the Mayor, October 28, 1859, signed by D. T. Valentine, Clerk of the Common Council."

Same objection; same ruling; exception.

Mr. FREEDMAN: The scale is 100 feet to the inch, and it refers particularly to that portion of the map between 110th and 114th Streets.

Received in evidence as City's Exhibit 80, but not marked.

Mr. FREEDMAN: We offer in evidence from the approved proceedings of the Board of Aldermen, a resolution adopted by the Board of Aldermen, September 26, 1859, and adopted by the Board of Councilmen October 20th, 1859, and approved by the Mayor, October 29, 1859, approving this map.

Mr. MEAD: Have you got it here?

Mr. FREEDMAN: No, I haven't got it here.

Mr. MATHEWSON: I object to this until the resolution is produced and we see what it is.

4283 Mr. FREEDMAN: We will furnish copies.

Mr. MATHEWSON: I know. I think we have got to determine whether it is permissible or not by seeing what the resolution is.

The MASTER: The ruling will be reserved on that until it is produced.

Mr. FREEDMAN: Now we offer in evidence—I think we stated that there would be no interruption outside of taking this documentary proof, so Mr. Hatton would have to come from the Department of Highways to prove these maps, unless Mr. Mathewson will concede them. Mr. Hatton is here now and can testify.

The MASTER: Is this all?

Mr. FREEDMAN: There are the water grants.

The MASTER: Go on and put them in and call Mr. Hatton afterwards.

Mr. FREEDMAN: We offer in evidence from Liber H, page 410 of Water Grants, produced from the Comptroller's office, a grant to Hezekiah Bradford, dated June 22nd, 1846, of land under water between 14th and 15th Streets and East River, with the map thereto attached. The grant is from the Mayor, Aldermen and Commonalty of the City of New York to Hezekiah Bradford, dated the 22d day of June, 1846, and covers premises extending from high water mark out to Tompkins Street and between 14th and 18th Streets.

Mr. MATHEWSON: Do you mean 14th Street or 18th Street?

Mr. FREEDMAN: It extends on the Tompkins Street front from 14th to 18th Streets, and on the high water mark between 14th and 15th Streets.

Mr. BURR: Will you have a tracing of this map made?

Mr. FREEDMAN: Yes, sir; I will have a tracing of the entire water grants and a tracing of the maps made.

4284 Mr. MEAD: It has not been proved yet.

Mr. FREEDMAN: It proves itself; it is under seal.

Mr. MATHEWSON: Is it acknowledged?

Mr. FREEDMAN: It does not seem to be acknowledged.

Mr. MATHEWSON: Then I will object. The deed is not proven.

Mr. BURR: Have you the original of this deed?

Mr. MEAD: I could not say. I never had anything to do with it.

Mr. MATHEWSON: There is no question but what these water rights were substantially vested in the Consolidated Gas Company?

Mr. FREEDMAN: There is no question that whatever rights are in these grants became vested in the Consolidated Gas Company. I have not examined the *inter sese* conveyances at all.

Mr. MATHEWSON: If it will be conceded that these water grants subsequently became invested in the Consolidated Gas Company, as they were, I will withdraw objection to the proof of these deeds, and so forth.

Mr. FREEDMAN: I do not think there will be any objection to admitting or conceding that whatever title was obtained under these water grants became vested in this gas company.

Mr. Mathewson: That is all. It will simply save us the trouble of putting in a lot of mean conveyances.

Mr. Freedman: Yes.

Mr. Mathewson: In view of that, and as it will save us the trouble, I think we will withdraw, and I do withdraw, the objections to these grants.

Mr. Burr: Then the objections to the grants that have been heretofore interposed are withdrawn?

Mr. Mathewson: Yes, on Mr. Freedman's concession.

4285 Mr. Freedman: It is hereby conceded by the City that whatever title was conveyed by the Mayor, Aldermen and Commonalty under and pursuant to the water grants introduced in evidence in this action subsequently became vested in the Consolidated Gas Company by various mean conveyances.

Mr. Mathewson: And that refers not only to the deeds which you have produced, but those which you propose to introduce?

Mr. Freedman: Yes, I say the water grants referred to in the testimony here.

Paper received in evidence as City's Exhibit 81, but not marked.

Mr. Mathewson: We understand that the City will produce and will inform us respecting any other or further grants relating to these companies from the City which Mr. Freedman has produced, and which he is about to produce.

Mr. Burr: I think you should concede, in view of these concessions, that the Tompkins Street which appears upon the map attached to this grant to Bradford, is the Tompkins Street which appears on your Exhibit 48.

Mr. Mathewson: I know of only one Tompkins Street, but whether it may have been widened or changed, or some other thing, I do not know. If it has been, the City has that all in its possession and can produce it.

Mr. Freedman: So far as my investigations are concerned, from 1809 down to the present time, it has never been widened, and its position has not been changed, and these grants were made with reference to the Tompkins Street as laid down on the map.

4286 The defendant, the City of New York, offers in evidence counterpart of a water grant to John J. V. Westervelt, contained in Liber H, page 471, of the land between 44th and 45th Streets, together with the map accompanying said grant. The grant extends from high water mark out to the easterly side of 13th Avenue, which is the exterior line established by law, and from the centre of 44th Street to the center of 45th Street in front of the land of John J. V. Westervelt.

Received in evidence as City's Exhibit 82, but not marked.

Mr. Freedman: The defendant, the City of New York, offers in evidence counterpart of a grant from the City of New York to John J. V. Westervelt of the land between the center line of 45th Street and the center line of the block between 45th and 46th Streets, extending from high water mark out to 13th Avenue, the exterior line established by law, dated the 1st day of May, 1850; signed by the grantee, together with map attached thereto.

Received in evidence as City's Exhibit 83, but not marked.

Mr. **Freedman**: The defendant, the City of New York, offers in evidence grant made by the Mayor, Aldermen and Commonalty of, the City of New York to Francis B. Cutting and Charles C. King, dated 18th of July, 1850, of premises extending from the center line of the block from 45th to 46th Street to within about 32 feet of the southerly line of 47th Street and extending from high water mark out to Thirteenth Avenue, the exterior line established by law, together with map attached thereto.

Received as City's Exhibit 84, but not marked.

Mr. **Freedman**: The defendant, the City of New York, offers in evidence grant from the Mayor, Aldermen and Commonalty 4287 of the City of New York to Charles E. Appleby, dated August 27th, 1857, contained in Liber I, page 193 of Counterparts of Water Grants, of land between the center line of 41st Street and the center line of 42d Street, extending from the original high water mark out to the Thirteenth Avenue, the exterior line as established by law, and the map attached thereto.

Paper received as City's Exhibit 85, but not marked.

Mr. **Freedman**: The defendant, the City of New York, offers in evidence grant to the Harlem Gaslight Company, contained in Liber I, page 514, of land between 110th and 111th Streets, and the Harlem River, dated the 20th day of August, 1870, and the map thereto attached, extending from the center line of 110th Street to the center line of 111th Street, extending from the original high water mark out to the bulkhead and pier-head line.

Paper received as City's Exhibit 86, but not marked.

Mr. **Burr**: Mr. Hatton is going. It is not necessary for him to be called under your withdrawal of your objection?

Mr. **Mathewson**: No. These are all the grants to which your concession related? You have put them all in now which you have here?

Mr. **Freedman**: Yes.

Mr. **Mathewson**: Then I withdraw any objection that I have made to the proof of these originals, they being, of course, accessible to us whenever we desire, and you to furnish us copies.

Mr. **Freedman**: Yes.

The **Master**: Do I understand you are all finished with the exception of your Doctor Marks matter?

4288 Mr. **Burr**: Why, no; I have subpœnaed all the Directors——

The **Master**: I mean outside of the directors.

Mr. **Burr**: Then I have my accountants. Their report will be ready, I expect, by Monday.

The **Master**: Are we to have two sets of accountants? Is Senator Page to introduce accountants' testimony?

Mr. **Burr**: No, he has no accountants. The City has had their set of accountants at work since October.

James L. Wells resumed.

By Mr. **Page**:

Q. I believe Block 979 is the next. Have you viewed that property?

Mr. **Mathewson**: He covered that, did he not?

The **Witness**: No, I commenced on it and then we stopped.

Q. Block 979 is the block between Avenue A, marginal street, 22d and 21st Streets.

A. I have that block, and I have appraised that block, including a small portion shown on the map as No. 29.

Q. Shown on what map?

A. On the tax map, as being assessed to the City.

Q. But in your computation you have included that?

A. I have included that in the ownership of the gas company.

Q. What total valuation did you give?

A. My total is $413,406.

Q. How did you arrive at that total?

A. I valued two corners of Avenue A at $12,500 each,
4289 $25,000; two lots adjoining, $10,000 each, $20,000; three lots on Avenue A, $9,000 each, $27,000; one lot on Avenue A, 22 feet 6 inches front by 100 feet in depth at the rate of $9,000, $8,100; I valued the plot on the southwesterly corner of marginal street and 22d Street, about 173 feet along the center line of the block by 98 feet 9 inches in the rear and containing about 17,000 square feet, at $51,000; I valued a plot on the northwesterly corner of marginal Street and 21st Street, 151.25 feet on 21st Street, by about 125 feet along the marginal street and about 73 feet along the center line of the block and 98 feet 9 inches in the rear, and containing 11,074 square feet, at $44,296; I valued 20 lots on 21st Street, at the rate of $6,500 each, $130,000; sixteen lots on East 22d Street at an average of $6,750, $108,000, making $413,406. This assumes that the company has a frontage on marginal street from 21st Street to 22d Street.

Q. Well, even if the City had taken the plot, they would still have a frontage?

A. They would, but not the entire frontage. I say this assumes that the company has a frontage on the marginal street from 21st to 22d Streets.

By Mr. **Mathewson**:

Q. But there is no independent owner between the company and the street?

A. There is no independent owner.

By Mr. **Page**:

Q. Now Block 978.

A. Block 978 is the entire block between Avenue A, Avenue B, 20th and 21st Streets, with the exception of a parcel known as No. 332 Avenue A, being 23 feet wide and 70 feet in depth.

Q. At what did you value the property, excluding that
4290 one lot which you mention?

A. I valued that at $368,265.

Q. How did you arrive at that valuation?

A. I made an independent sub-division of the block, making the lots as nearly as possible 25x100 feet, and I valued two corners of Avenue A at $12,500 each, making $25,000; two lots next the corners, each 25 by 100 feet, at $10,000, $20,000; one lot, 50 feet south of the corner of 21st Street, 25 feet by 100 feet, at $9,000; one lot, 17 feet by 100 feet north of No. 332, at the rate of $9,000, making $6,120; a small plot in the rear of No. 332, 23 feet by 30 feet, I valued at $1,325; that comes that way (indicating) and would be the rear of that lot; and one lot, 19 feet by 100 feet, at the rate of $9,000, $6,840; twenty lots on East 20th Street, at $6,750, making $148,500; twenty lots on East 21st Street, at $6,500, $143,000; one lot, 16 feet by 100 feet, on East 20th Street, at the rate of $6,750, making $4,320; one lot 16 feet by 100 feet on East 21st Street, at the rate of $6,500, $4,160.

Q. Now, you may take Block 987.

A. Block 987, I value it as shown on the schedule furnished me.

Q. Exhibit 48?

A. Yes, Exhibit 48, which shows that the block has a frontage of 184 feet on Avenue B, 84.54 feet on East 21st Street and 238.78 feet on East 20th Street. For the purposes of this appraisement I divided it into two parcels, taking the center line of the block, and I valued the northerly portion which contains about 9,025.20 square feet at $31,588, and the southerly or lower portion that contains 16,120.24 I valued that at $56,420, making $88,008.

Q. That is, assuming the size of the block as shown on Exhibit 48?

A. Yes, sir, and assuming that the company has a frontage on marginal street from 20th to 21st Streets.

Q. Block 1090, Lot 23, being a parcel on the north side of 42d Street, 100 feet west of Eleventh Avenue, and 150 feet by
4291 100 feet 5 inches.

A. There is six lots frontage in that parcel, and I valued it at $72,000.

Q. How did you arrive at that valuation?

A. $12,000 a lot.

Q. The next parcel is 1071, being on the north side of 42d Street, distance 225 feet east of Eleventh Avenue, 100 feet by 100 feet 5 inches.

A. Four lots frontage in that parcel. I valued it at $50,000, being $12,500 each.

Q. Block 1070.

A. 1070, Lot 5.

Q. Being the parcel on the north side of 41st Street, 100 feet east of Eleventh Avenue, 200 feet by 98 feet 9 inches.

A. I valued that parcel at $76,000. There are eight lots *lots* fronting on the street.

Mr. Mathewson: $9,500 a lot?

The WITNESS: Yes, sir.

Q. Now block 1089?

A. 1089 is the block bounded by Eleventh Avenue, Twelfth Avenue, West 41st Street and West 42d Street.

Q. In making your valuation have you assumed that the City owned Twelfth Avenue, or that the company owned Twelfth Avenue?

A. I assumed that the City owned it.

Q. Now, what value do you give on that assumption?

A. $584,500.

Q. You may state how you arrived at that result.

A. I valued one lot on the southwest corner of Eleventh Avenue and 42d Street at $17,500, and the adjoining lot at $12,500; the next lot at $11,000; two lots in about the center of the front on Eleventh Avenue, each 23 feet 9 inches by 100 feet, at the rate of $9,500 each, $19,000; one lot on the northwest corner of Eleventh Avenue and 41st Street at $14,000, and the adjoining lot at $10,500; the 4292 next lot at $10,000; twenty-eight lots on 42d Street at $11,500 each, making $322,000; and twenty-eight lots on 41st Street at $6,000 each, making $168,000; total, $584,500.

Q. Block 1092.

A. 1092 is the greater part of the block between Eleventh and Twelfth Avenues and 44th and 45th Streets. The frontage on Eleventh Avenue being out.

Q. And in valuing this block did you assume that the City owned Twelfth Avenue or the company owned it?

A. I assumed that the City owned Twelfth Avenue.

Q. You may give the total value of that block?

A. I value the block at $422,500.

Q. You may proceed to give how you arrived at that valuation.

A. I valued twenty-four lots on 44th Street at $7,500 each, $180,000; twenty-three lots on 45th Street at $7,500 each, $172,500; and eight lots on Twelfth Avenue, $70,000.

Q. Block 1093?

A. Block 1093, lot 1, is the greater portion of the block between Eleventh and Twelfth Avenues, 45th and 46th Streets.

Q. 500 feet on 46th Street and 575 feet on 45th Street?

A. Yes, forty-three lots. I valued them at $7,500 each, making $322,500.

Q. And in this case you have also assumed that the City owned Twelfth Avenue?

A. I have.

Q. Is Twelfth Avenue under water now?

A. A portion of it is; the greater portion of it is, I think.

Q. Now, block 1457?

A. 1457, No. 6, is about the center of the block bounded by First Avenue, Avenue A, 62d Street and 63d Street.

Q. What value did you place upon that?

A. I valued that at $149,230.

Q. How did you arrive at that value?

A. I valued ten lots on 62d Street t $7,500 each, making

$75,000; and eight lots on 63d Street at $8,000 each, making
4293 $64,000; I valued 16 feet 6 inches on 62d Street at the rate
of $7,500, $4,950, and 16 feet 6 inches on 63d Street, at the
rate of $8,000, $5,280, which gave me the total, $149,230.

Q. Block 1455?

A. Lot 13. It is practically the easterly half out of the block bounded by First Avenue, Avenue A, 60th Street and 61st Street.

Q. You may give the value of that.

A. I valued that at $185,500.

Q. How did you arrive at that result?

A. I valued the two corners on Avenue A at $12,500 each, making $25,000; two lots next the corners at $10,000 each, $20,000; four lots on Avenue A at $8,500 each, $34,500; eight lots on 60th Street at $6,500, making $52,000; one lots 13 feet wide by 100 feet deep on 60th Street at the rate of $6,500, $3,380; eight lots on 61st Street at the rate of $6,000, $48,000; one lot 13 feet wide by 100 feet in depth on 61st Street at the rate of $6,000, $3,120.

Q. Now, block 1474, lot 24?

A. That is a small triangular piece of land at the northeasterly side of Avenue A and 60th Street; it has a frontage of 64 feet on 60th Street and 114 feet 5 inches on Avenue A.

Q. And 30 feet on 61st Street?

A. No, it does not go through.

Q. Thirty feet on its northerly line, I mean; is that what you have it?

Mr. Mathewson: It is more than that.

The Witness: I don't know just what it is on the map. It shows that way on mine (indicating). The testimony says that there is 5,230 square feet, but I cannot make that out. The City assesses it for a lot and one-ninth of a lot, 1 lot and .09. It is nearly two lots.

Q. What did you assume?

A. I have assumed 5,230 feet because of the difference be-
4294 tween the two diagrams and my inability to find out that
northerly dimension.

Q. What was the value you placed upon it?

A. $20,920.

Q. That is, assuming that there is 5,230 square feet?

A. Yes.

Q. Proceed with block 1177.

A. 1177 is the irregular block bounded by West End Avenue, the yards of the New York Central Railroad, West 65th Street and West 66th Street.

Q. What value did you place upon that?

A. I valued that property at $170,757.60.

Q. How did you arrive at that result?

A. I valued two corners at West End Avenue at $13,000 each, $26,000; two lots adjoining the corners at $10,000 each, $20,000; four lots on West End Avenue at $9,000 each, $36,000; fifteen lots on 65th and 66th Streets at $5,000 each, $75,000; and two gores along the railroad yards containing 6,878.8 square feet, $13,757.60, making my total of $170,575.60.

Q. Block 1157?

A. 1157, lot 1, is the entire block bounded by Amsterdam Avenue, West End Avenue, West 65th Street and West 66th Street. The block is 800 feet in length.

Q. By 200 feet 10 inches in width?

A. By 200 feet 10 inches in width.

Q. What value do you place upon that?

A. $596,000.

Q. How do you arrive at that result?

A. I valued two corners on West End Avenue at $14,000 each, $28,000; two lots next to the corner at $10,000 each, $20,000; four lots at $9,000 each, $36,000; two corners on Amsterdam Avenue at $25,000 each, $50,000; two lots next the corners at $14,000 each, $28,000; four lots on Amsterdam Avenue at $12,500 each, $50,000; forty-eight lots on 65th Street at $8,000 each, $384,000, making a total of $596,000.

4295 Q. Now, Block 1156, Lots 45 and 46.

A. I valued that parcel at $32,000, four lots at $8,000 each.

Q. Block 1670, Lot 1.

A. 1670, Lot 1, that is the entire block between Second Avenue and First Avenue, 98th and 99th Streets.

Q. What value do you place upon that block?

A. $463,000.

Q. How do you arrive at that result?

A. I value two corners on Second Avenue at $17,500 each, $35,000; two lots adjoining the corners $13,000 each, $26,000; four lots at $12,000 each, $48,000; two corners on First Avenue at $14,000 each, $28,000; two lots adjoining the corners at $10,000 each, $20,000; four lots on First Avenue at $9,000 each, $36,000; and thirty-six lots on 98th and 99th Streets, at $7,500 each, $270,000; making $463,000.

Q. The next is Block 1692, I have here.

A. I valued that at $191,114.

Q. You may give your method of arriving at that valuation.

A. That is the block bounded by First Avenue, marginal street, East 98th and East 99th Streets. I gave the value, did I not?

Q. Yes. The question is how you arrived at that value?

A. I valued two lots on two corners of First Avenue at $13,000 each, $26,000; two lots adjoining the corners at $8,500 each, $17,000; four other avenue lots at $8,000, $32,000; eight street lots at $5,000 each, $40,000; and a plot on the northwest corner of marginal street and 98th Street at $38,010; and on the southwest corner of marginal street and 99th Street at $38,104, making $191,114.

Recess until 2:15 P. M.

4296 After Recess.

James L. Wells resumes the stand and further testifies.

Direct examination continued by Mr. **Page**:

Q. Take up next Block 1683, Lots 18, 34 and 35.

A. Block 1683 consists of plot—one parcel is at the northwest corner of First Avenue and 111th Street, and the other parcels together form a plot 50 by 100 feet and 11 inches on the south side of 112th Street, 175 feet west of First Avenue.

Q. What is your total valuation?

A. $90,500.

Q. How did you arrive at that?

A. I valued a lot on the northwest corner of First Avenue and 112th Street at $15,000 and the adjoining lot at $12,000, and the next adjoining lot at $11,000; and I valued seven lots on the streets, at $7,500 each, which made $52,500; giving the total of $90,500.

Q. Now, take Block 1682.

A. Block 1682 is the greater part of the block bounded by Second Avenue, First Avenue, 110th Street and 111th Street. The property is situated on the west side of First Avenue extending from 110th Street to 111th Street and running back on each street 475 feet. I value that parcel at $371,000.

Q. How do you arrive at that?

A. I value the southwest corner of First Avenue and 111th Street at $17,500, and the lot adjacent to it at $13,000, and four lots at $12,000, making $48,000. I value the lot on the northwest corner of First Avenue and 110th Street at $17,000, and the lot adjacent to that at $13,000. Fifteen lots on 110th Street at $8,500, making $127,500; and fifteen lots on 111th Street at $9,000, making $135,000; making my total of $371,000.

Q. Now, take Block 1704, Lot 1.

4297 A. That is the entire block between First Avenue, Pleasant Avenue, 110th Street and 111th Street. I value that block at $364,500.

Q. Proceed to give us how you arrive at that.

A. I valued the northeast corner of First Avenue and 110th Street at $13,500, and a lot adjacent to the corner at $11,000; four other lots on Pleasant Avenue at $10,000, making $40,000; the northeast corner of First Avenue and 111th Street I valued at $15,000, and the lot adjacent——

By Mr. **Mathewson**:

Q. Wasn't that the southwest corner instead of the northeast corner?

A. Yes, sir, it is the southwest.

Q. At how much?

A. $15,000. And one lot adjacent at $12,000, and a lot on the northwest corner of Pleasant Avenue and 110th Street at $11,000; a lot adjacent at $8,000; the southwest corner of Pleasant Avenue and 111th Street at $13,000; 16 lots at 111th Street at $7,000, making $112,000; and 16 lots on 110th Street at $5,500, making $88,000; which makes my total of $364,500.

By Mr. PAGE:

Q. Now, you may turn to the property, Block 1712 if you have that?

A. I have that, 1712. That is that little piece. I am unable to find any testimony as to area. I have approximated the area at 13,462 square feet.

By Mr. MATHEWSON:

Q. Under water?

A. No, it is not all under water. It includes some of the land under water but how much I do not know. I have taken the whole parcel.

4298 Q. Do you take in that computation the line from 110th to 111th Street?

A. I did, sir.

Q. Running out——

A. Running out to the dotted line in the atlases, which is the bulkhead line, as I understand it.

By Mr. PAGE:

Q. Now, what valuation did you place on that?

A. $53,848.

Q. Block 1999, Lot 1?

A. That consists of nearly all the block bounded by Broadway or the Boulevard, 12th Avenue, 132d and 133d Streets, about nine lots out on the Boulevard front. I valued that property at $346,200.

Q. Now, you may state how you arrived at that?

A. I valued Twelfth Avenue corners at $12,500 each, and the two lots adjoining the corners at $10,000; two 25-foot front lots at $8,000 each, and two lots each 23 feet 9 inches front at $7,600 each; and I value 45 street lots on 132d and 133d Street-, 23 of them on 132d Street and 22 on 133d Street, at $6,000 each, making $270,000, giving me my total of $346,200.

Q. Now, we will take block 2175?

A. Lots 15, 18, 22 and 100. That consists of a very irregularly shaped piece of land running from Broadway southeasterly to Jerome Avenue. I estimate that there is in those four parcels 65,253 square feet, or about 26 lots, and I value the plot at $89,375.

Q. I understand, Mr. Wells, that where there is property in large parcels you have taken into consideration the plottage in the figures that you have given rather than giving them separately?

A. I have, yes, sir.

By the MASTER:

Q. Have you computed the totals?

4299 A. No, I have not had the opportunity. I will furnish the...

Mr. PAGE: We will do that.

Cross-examination by Mr. Mathewson:

Q. How long were you connected with the Department of Taxes and Assessments?

A. I was there during Mayor Strong's administration, the greater part of three years; and during the entire administration of Mayor Low, two years.

Q. It was not the custom in those days, was it, to appraise land at its full value in the City of New York, particularly the Borough of Manhattan?

A. The deputies took an oath that they would appraise it at what it would sell for in their judgment under ordinary circumstances.

Q. I am asking you?

A. I found many discrepancies between full value and the percentage at which——

Q. (Interrupting.) Didn't you find as a rule that the valuation for assessment was less than the value you would place upon that property if you were appraising it for a private owner?

A. Yes, sir; in many cases.

Q. Isn't that true in the majority of cases?

A. It was at that time.

Q. And when you say at what under ordinary circumstances the property would sell, exactly what do you mean? What manner of sale?

A. I mean what a willing purchaser is ready to give and what a willing seller is ready to accept.

Q. You had only a small part of this land appraised at the hearing last Friday?

A. I only appraised a small portion.

Q. And when we adjourned or when you suspended yesterday there was still a considerable part of the land that you had not yet appraised, is that right?

A. A considerable portion that I had not completed my figures on, but I had made my examinations.

4300 Q. Yes, but I mean you had not at that time considered the figures you would place on it?

A. Not fully, no sir.

Q. How long have you taken altogether to make up your figures on this property?

A. I have been actively engaged on it for about three weeks.

Q. In making up the figures or in examining the property?

A. No, in examining the property and preparing the necessary documents and posting myself with regard to the property, familiarizing myself with it.

Q. Isn't that a rather short time to make a thorough appraisal of so many pieces of property of such large extent?

A. Not unusually short.

Q. Wouldn't it have been preferable to get a longer time if possible?

A. I would not have been obliged to work so hard. It would have been preferable for me in that respect.

Q. Will you turn to page 1 of Exhibit 48, and consider Block 1643 at the corner of 116th Street and Lexington Avenue?

A. Yes, sir.

Q. When you took your corner lot there, how did you run it?

A. I faced it on 116th Street.

Q. So that it was only 25 feet deep on the avenue?

A. Oh, no. It was 100 feet deep on the avenue.

Q. The corner lot?

A. The corner lot would be 25 feet on 116th Street and 100 feet deep on the avenue.

Q. Is that the usual method of plotting?

A. I considered that would be the better method in this instance, for 116th Street is a much wider street than Lexington Avenue.

Q. Is it as much of a business street as Lexington Avenue, or are neither business streets?

A. Well, neither are as much business streets as Third Avenue, but they are both growing into business.

4301 Q. Take the next block, Block 1642, at the northwest corner of 114th Street and Third Avenue?

A. Yes, sir.

Q. Do you mean to say that the fact that you have a frontage on both Third Avenue and on Lexington Avenue, an L-shaped piece of the character you see here, does not make an additional value to the property?

A. If there is any additional value I took it into consideration when I made my appraisal of it. That is not the natural arrangement of the land.

Q. You do it in many cases because there is an additional value, but you do not think there is in this case?

A. I do not think there is.

Q. Don't you think those two lots, 50 feet wide facing on the street, are of additional value because they are of a plot which extends out and faces on Third Avenue?

A. No, I do not, not for the final improvement of the property.

Q. Isn't a piece of property facing on a street and *and* an avenue in that way, L-shaped, usually more valuable on that account, and having two entrances?

A. It depends upon the conditions affecting the property—the location, character of business and so forth.

Q. Isn't it generally true?

A. Not always.

Q. Isn't it generally?

A. People usually feel so about a lot.

Q. Now, take the property at Irving Place and 15th Street, Block 870. What did you give for the value of the street lots there?

A. $22,500 for 25 by 100 feet.

Q. But some of the streets you put down lower than that, didn't you?

A. I don't understand your question.

Q. Some of the lots. The next lot is $20,700, you say?

A. No. I think you have that incorrect. There are two lots here, 25 by 100, at $22,500. Then I took 5½ feet by 100 at that rate and made it $4,950.

4302 Q. Well, on page 4195, if I read correctly, you say for the next lot $20,700?

A. No, I think——

Q. "For the first lot $20,700, for the next lot $20,700."

A. Well, that was after estimating that they were short lots. I took the basis of a lot as $22,500, 25 by 100 feet, and as these lots were only 84 feet in depth I allowed 92 per cent. of that amount for the 84 feet.

Q. How about lots on Irving Place?

A. There I made the lots full depth.

Q. What value would you place on a single lot?

A. I placed a value of $60,000 on the corner.

Q. And an interior lot?

A. $42,500 next to the corner and $40,000 for the one next to that, and there were nine feet over that I allowed for at the same rate.

Q. Hasn't the city acquired some lots on East 15th Street very recently?

A. I understand that the city has been acquiring property in that neighborhood.

Q. Hasn't it paid very much higher rates for that property in June, 1906?

A. The city often does that, sir.

Q. Well then as a matter of fact have they not in this case?

A. I think they have paid higher, but there were buildings and it is difficult to ascertain what they did pay.

Q. The old buildings, at say from 125 to 131 East 15th Street, would not add much to the value, would they, in the purchase of that property?

A. They had a rental value in there.

Q. But not for the uses of the city?

A. No, not for the uses of the city, but the city had to pay for them, because they were taking them from citizens.

Q. Don't you know that some of those lots, 23 by 100, with old buildings, worth perhaps not over $3,000 to $4,000, did sell at from $30,000 to $48,000?

A. No, I don't know it.

4303 Q. Have you the records of what the city paid for 129 and 131 East 15th Street?

A. Yes, sir. I have the record here of all those transactions.

Q. Well, what did the City pay for 131 East 15th Street, 23 by 100?

A. It would take me some time to find that. My records show that they bought on 16th Street.

Q. Yes, and they bought on 16th Street and they paid there for 126 East 16th Street, $40,000, didn't they, including the old building?

A. I have a record of a sale at 138, 140, 146, 150.

Q. You haven't the record of the sale at 126 East 16th Street to the City, of 128 East 16th Street?

A. I have a record of No. 131.

Q. 131 East 15th Street, isn't it?

A. 131 East 16th Street.

Q. What is the dimension of that lot?

A. 23 feet front by 92 feet in depth, and it had on it a five-story brick building, sold to the City of New York.

Q. For how much?

A. The record says for $48,000.

Q. Well, property in 16th Street would not be as valuable as it is in 15th Street, is it, at the location of the Consolidated Gas Company's building?

A. No, I think not.

Q. And you have no idea that the value of that building would represent the difference between the $48,000 and the $20,700 as you fixed for the value of the Consolidated lot, have you?

A. I had not estimated the building was worth as little as you say.

Q. It would not be worth so much that it would make up the whole difference between $20,700 and $48,000 would it, as it would ordinarily sell?

A. The building was assessed for over $10,000.

Mr. Mathewson: Will the stenographer repeat the question?

4304 The Stenographer (reading): "It would not be worth so much that it would make up the whole difference between $20,700 and $48,000, would it, as it would ordinarily sell?"

A. That I don't know. I have made no estimate of it and I pay very little attention to values made through condemnation proceedings.

Q. Well, these were old buildings, were they not?

A. They were fairly good buildings.

Q. But they were pretty old?

A. Yes, sir. All those buildings in there are old. It is an old section of the city, but it was a condemnation proceeding.

Q. Well, by condemnation proceedings you refer to the proceedings where the parties are heard and where it is supposed to be impartial and the commission makes an award or finding?

A. But the opinion there is another man's opinion, not mine. I have been asked to give my opinion. They have given their opinion based on testimony, and other things.

Q. Did you allow anything for plottage in this Irving Place property, Block 870?

A. I included that in my estimate of the value of the lots.

Q. How much did you allow for plottage?

A. Plottage runs all the way from 5 to 10 per cent., 10 per cent. being the extreme allowance, I think.

Q. In this case how much did you allow?

A. I don't know how much if you itemize it in that way. No one would consider this plot in separate lots except for the purpose of ascertaining the value. No one would sell it in separate lots.

Q. Well, you must not say that because if we did sell it in separate lots that would reflect upon you?

A. It would ruin the property to sell it in separate lots.

4305 Q. It would be worth more as a whole than in individual lots?

A. It is worth more as a whole. The new building law makes it so.

Q. Now, Block 239, at the northeast corner of Elizabeth and Hester Streets, you valued the street lots there, the Elizabeth Streets lots——

A. No, I faced the lots on Hester Street, four of them.

Q. Yes, and then you face lots on Elizabeth Street?

A. Yes, two of them.

Q. And valued them at $17,500 each?

A. The two on Elizabeth Street in the rear of the Hester Street front.

Q. And what do you value the lowest priced lots on Hester Street?

A. $22,500.

Q. Has not property in that vicinity sold for as high as $26,500 a lot within the last year or two, with buildings which were practically worthless?

A. Yes, it may have been so in that vicinity, but that is not the corner of Hester and Elizabeth.

Q. Well, how far is 174 Hester Street from this?

A. I don't remember the distance. I went and looked at the property. Not very far away. This is No. 80 Elizabeth Street——

Q. Hester Street?

A. 157-9 Hester Street.

Q. Did not 174 Hester Street, a lot 25 by 100 feet, sell for $26,500?

A. I think so, sir, but I know nothing of the circumstances under which it was sold.

Q. Let us take the next block, 985, between 17th and 18th Streets, east of Avenue B. Did you allow 5 per cent. for plottage, do I understand——

A. Well, I never seperated the plottage from the value I placed upon the lots. I consider the lots worth so much in a combination such as this.

Q. You include your plottage in the valuation of individual lots?

A. I do. I put a higher value on them for that purpose. My judgment is that they would sell for those figures if sold in proper parcels.

4306 Q. Well, just exactly what did you mean when you said, "I valued the lots on East 17th Street at $7,500 each, the lots on 18th Street at $7,000, adding 5 per cent. for plottage?"

A. I thought the lots on 17th Street were a little better than those on 18th Street when I examined them.

Q. Why?

A. I thought the surroundings were better.

Q. Outside of the existence of the gas works?

A. Yes; better buildings on 17th Street than on 18th Street, that is, opposite these lots.

Q. Can you point out any sale of these lots in that immediate vicinity, any vacant lot, that has sold as low as $7,000 within the last year or two?

A. No, I do not think I can find any. No. 616 was sold at about that figure.

Q. No, 616 what?

A. No. 616 East 17th Street.

Q. When?

A. It was sold on the 1st of February, 1904, the Record shows.

Q. Well, the other witnesses have testified that values have very substantially increased within the last two or three years. Don't you agree with them?

A. There is a stronger market, very much stronger, but that is in certain localities.

Q. Well, generally speaking, rents have advanced, have they not, and the value of real estate in New York have advanced in the last two or three years?

A. Very much so in some neighborhoods.

Q. Is it not so in that particular neighborhood?

A. There is a stronger market in that neighborhood; that is, you can sell property more readily than you could some years ago.

Q. This lot to which you have referred as sold in 1904——

A. That had a six-story brick building on it.

Q. And it was a single lot and not part of a plot, was it not?

A. Yes, but it was a six-story brick tenement house with a store.

Q. Are you familiar with the sales from 518 to 524 East
4307 16th Street, made, I think, in April, 1906?

A. No, I have not those; I have from 528 to 536, made in March, 1904.

Q. Well, I am getting nearer the present date.

A. Some of those sales I could not find.

Q. I have a record of the sale here of those lots at $50,000, three lots at $50,000, with old buildings which are said to have been worth perhaps $12,000; that would make $12,750 for the land if that be true. Have you not some record from which you can say whether that is correct?

A. In a great many sales the considerations are nominal and it is very difficult to determine what they bring, as you can only approximate that by determining the age of the buildings on the property and finding out what percentage somebody has loaned on the property.

Q. Yes, but I am assuming that the sales were made at the price I have suggested. If that be true, that would be a substantially higher valuation than you make, would it not?

A. Yes, but you cannot assume those things unless you know them to be so.

Q. I am assuming that it be so, that is a higher valuation than you have made?

A. Well, a practical real estate man would not make the assumption.

Q. Well, I am making the assumption.

A. Well, you have a right to.

Q. I say if it be true that sales were made at that price in that section, it would be a substantially higher figure than your present estimate, would it not?

A. It would be higher, but one would have to inquire into the circumstances of the sale; there may have been a fictitious consideration in the deed, as often is the case.

Q. I am assuming that it did sell for that price and that that was not the consideration named, because the other witnesses, if you have read their testimony, testified, did they not, that they took into consideration sales which they knew of, and sales which they 4308 actually found had disregarded the nominal consideration?

A. I have looked up all the sales that took place in the neighborhood in the last three years.

Q. Then you do not find these sales that took place——

A. Give me the number again, please.

Q. 518 to 524 or 522.

A. I find 521 East 16th Street. 514 to 516?

Q. Nos. 518, 520, 522 and 524?

A. I find 526.

Q. Well you are just outside 518 to 524 East 16th Street, which sold in the spring of 1906.

A. 514 to 516, I have that; 518 to 524 I have.

Q. Did not that property sell for $50,000?

A. The *Real Estate Record* does not show it did. It says "nominal consideration."

Q. So that you have not the record——

A. It was sold subject to a mortgage of $39,000.

Q. The mortgage was $39,000?

A. It was, but it was 75 feet front and there were four 4-story brick tenements on it.

Q. Were those tenements not old 4-story brick buildings?

A. I did not examine them, sir. It was a nominal consideration.

Q. Let us take the next block, 989, lot 1, facing on Avenue C, which you have appraised at $139,500. Are you aware that that plot is assessed for taxation at $155,000?

A. Yes, sir.

Q. Or much more than you have estimated it?

A. Yes, sir, I have it.

Q. So, too, with Block 989, Lot 26, which is on the westerly side of Avenue D, between 15th and 16th Streets, it seems to be valued by you at $96,480, and it is assessed for taxation at $96,000?

A. Yes, sir. Merely a difference of opinion between two men who valued the property.

Q. Why did you face all the lots on the street in Block 989, Lot 26, instead of part on the Avenue?

A. Because the streets are very much better than Avenue 4309 D. Avenue D is an insignificant street there.

Q. Are the streets wider than Avenue D?

A. No, they are about the same width. They are the same width, but the condition of Avenue D—the streets are paved; 16th Street is paved with asphalt and 15th Street with granite; and Avenue D is old fashioned cobblestones, not even Belgian Block, but old fashioned stones.

Q. Is Avenue D a business street above and below this property?

A. There is more business above and below than on this block.

Q. Naturally, but there is more business on Avenue D than on the side streets, is there not?

A. Not on this portion; there is very little on Avenue D between these points.

Q. I understand, but these are the works of the Consolidated Gas Company?

A. Yes.

Q. But above the works of the gas company and below them Avenue D is better, is it not?

A. It is.

Q. And it is a business street?

A. More so than it is here.

Q. And it is a business street, more business than the side streets?

A. Yes, but here there is more business done on 15th Street and 16th Street than there is on Avenue D, and in my opinion values are stronger on those streets than on this portion of Avenue D.

Q. If these plots were to be sold and to be used for business purposes, don't you think the business houses would naturally front on Avenue D?

A. What kind of business houses?

Q. Oh, such business places as you find below 14th Street and above 16th Street on Avenue D?

A. I think not under the present surroundings; I paid especial attention to look at that point.

Q. What dod you mean by present surroundings, the presence of the gas company there?

A. No, the present way in which 15th and 16th Streets
4310 are built up.

Q. How did you happen to divide Block 991, Lot 26, into 4 plots instead of into lots in your valuation?

A. Because I thought that was the more reasonable way of subdividing it; it would spoil that block to sell a lot out of it, it would spoil it for business purposes.

Q. Would it not spoil any of these other blocks to sell lots out of them, which you treated in a different manner?

A. No, in some cases those large blocks could be sold in parcels. It is customary now with buyers to buy more than one lot at a time for permanent improvement.

Q. Take Block 991, Lot 1, the plot on 14th Street. Did you observe that that was assessed at $180,000?

A. I observed that, yes, sir.

Q. As a matter of fact, while you found some little variation between the measurements of this plot as appearing on Exhibit 48 and the tax maps, your observation led you to think that the dimensions on Exhibit 48 were correct rather than the tax map, did you not?

A. Yes, I thought so, from making a plottage of the block.

Q. Now, I observed in Block 988, which is the entire block between Avenues C and D and 14th and 15th Streets, you faced your lots on Avenue C to some extent?

A. Yes.

Q. But in Block 982, immediately west of Avenue D from that, I think you faced them all on the street, did you not, on 14th Street, did you not?

A. Yes, I think I did there.

Q. Well, what is the difference? They are directly across the street from each other?

A. It is a better street there probably, there must have been something I saw in going upon the property. What was the other number?

4311 Q. 982, directly west across Avenue C.

A. Yes, but 982—one has a frontage on 14th Street and the other block has not.

Mr. Page: No, wait until you examine them.

Q. Both has a frontage on 14th Street and both on 15th Street?

A. Yes, that is true, but I faced all the lots on 14th Street, because 14th Street is a wider street than Avenue C and much more of a thoroughfare, but when you come around to this other block, I faced them the same.

Mr. Page: Well, that is his point, that you made a difference there in facing some on Avenue C and some on 14th Street.

Q. I understand you faced them relatively in the same manner?

A. Relatively in the same manner. I thought you were comparing between 14th and 15th Streets.

Q. No, 14th Street is more of a thoroughfare and lots on 14th Street are more valuable than on 15th Street and the other streets, are they not?

A. Yes, sir.

Q. Now, in considering Block 982, if I am correct, you figured the street lots at $9,500 each, as facing on 14th Street?

A. $9,500 each.

Q. And you valued the lots in Block 988 as facing on 14th Street at only $8,000.

A. That is true.

Q. Although they are only separated by Avenue C?

A. And at some distance.

Q. Do you consider there is any such difference in value between lots on 14th Street?

A. I do, there, yes, sir.

Q. Is it not true that the nearer you get to the river and bulkheads in a place like that, the more valuable your lots are?

A. Not always, sir.

4312 Q. Well, is it not generally true?

A. I do not think so in this case.

Q. Is it not generally true, not in this case, but as a general proposition?

A. I do not think I can answer as to its being generally the case; it is sometimes but not always the case.

Q. Can you point out any single lots that have sold on 14th Street within that vicinity within the last year at as low a figure as $8,000?

A. I find that No. 606 East 14th Street was a five-story tenement and store, was sold for $15,825.

Q. Yes, do you know how good a tenement and store that was, how much the building added to the value of the lots?

A. A five-story house and four-story brick on the rear.

Q. Do you know how old it was?

The Master: When was that sold?

The Witness: In April, 1904.

Q. Well, I asked you within the last year or so?

A. Well, the same property was sold in 1906 subject to a mortgage of $11,900.

Q. Do you know what the price received was?

A. No, the consideration was nominal.

Q. Do you know how old that building was?

A. No, I think it was an old building, but in fairly good condition.

Q. I observe that in the testimony of Messrs. Thompson and McHale that in the sale of property or estimating the value of property they allow only $4,000 or such a matter, if my recollection is correct, for the value of these old buildings or old tenements per lot of 25 feet, where the buildings are old; is not that your reading of their testimony, or have you not read it?

A. I have read their testimony. They may have made that
allowance for some buildings in some particular location, but
4313 it is not a general rule.

Q. You do not know what the value of that old building was on the lot which was sold, to which you have referred, do you?

A. No, I do not, sir.

Q. Referring to all the property at East 14th Street and 15th Street, is it not true that considerable value is added to that property by the fact that it is all in the hands of a single owner?

A. I took that into consideration when I valued it.

Q. Did you take into consideration, that the bulkhead rights opposite were owned by the Consolidated Gas Company also, as affecting the value of the upland?

A. On Tompkins Street? I did not take into consideration that the bulkhead rights there were owned by the company.

Q. What addition would you make for plottage in the case of Block 988, which is an entire block, what percentage should be allowed for plottage?

A. From 5 to 7 per cent.

Q. Well, taking all that property together would not 10 per cent. be a moderate estimate for plottage value?

A. No. 10 per cent. is a pretty large estimate on the value of land.

Q. You do not think it would be as much as that?

A. I do not. Plottage is a very indefinite item.

Q. But it is an item that is recognized by real estate men?

A. It is an item that is recognized by real estate men, but everybody differs on it. If it did not, there would be no sales.

Q. Will you now turn to page 3 of Exhibit 48 and direct your attention to Block 688 as it now exists, after the improvements, which you valued at $300,350. You valued the interior lots here, if I am correct, in reading the testimony, as low as $9,500 each?

A. On the side streets.

Q. Can you point out the sale of any lot in that vicinity as low as $9,500 for the lot within the last year?

4314 A. No. 415 West 16th Street, with a five-story brick tenement on it sold for—no, it sold for a nominal consideration; it sold subject to a mortgage of $12,000. I thought I had the natural consideration there. No, there have not been any sales on that street in the last year except where the consideration was nominal.

Q. Is it not true that property in that neighborhood has very largely increased in value in the last two or three years?

A. It has increased.

Q. Very largely increased in the last two or three years?

A. There is a better market, particularly on the avenue; it has increased on the avenue and on the marginal street, but not so much on the side street.

Q. Well, are you not familiar with the sale of 418 to 420 West 16th Street in 1902?

A. I have not gone back as far as that.

Q. You have not your records as far as that?

A. I have records, but I have not the records here.

Q. Let us take a more recent one, *445* (No. 445 is a stenographer's error. The question asked was in relation to 455.) West 16th Street, between Ninth and Tenth Avenues, a lot 25 by 92 feet deep with no buildings except a two-story frame building, said to be of no value; did not that sell in 1906 for $13,250?

A. No, I looked for that sale and could not find it. I think there is a mistake in the designation of the street, because I looked for it and my assistants looked for it.

Q. Well, it may — that the individual from whom I received the information may have had information which is not spread upon the record as to the actual consideration?

A. No, I think it was copied wrong, because in some cases we found buildings with that number on a different street. It is probably a little mistake in copying it.

Q. You do not find anything that corresponds to this?

A. No, I do not in this case, but I did in the other. Those things are so apt to occur that——

4315 Q. Referring to your valuation of $300,350, would it surprise you to know that the Company within a very short time, had received an inquiry as to whether they would sell that land for $500,000, with the statement that it was believed that it could be obtained?

A. I am never surprised at any statement in regard to real estate.

Q. You would not be surprised, then, if they received an offer of $500,000?

A. I would like to know who made the effer and the conditions.

Q. Oh, yes, that is all right——

A. I would not express any surprise——

Q. If you found buyers ready to offer $500,000 for that plot, would not that influence your judgment as to the accuracy of your valuations in this immediate section?

A. Why, I think it would some, yes, sir.

Mr. Page: I do not suppose that Mr. Mathewson assumes that the statement that a broker has said that he thought he could get some one to pay that is an offer of that amount.

Mr. Mathewson: Not at all. The suggestion came from the proposed buyer.

Q. Will you take Block 689, Mr. Wells, being between 17th and 18th Streets. There also you make the interior lots worth $9,500?

A. Yes, sir.

Q. Does not the value of the lots increase as you proceed towards 22d and 23d Streets, where the big ferries are located?

A. Yes, as you get beyond 18th Street, I should think they might.

Q. But I see, taking Block 690, which is above 18th Street, that you still continue to value the street lots interior lots at only $9,500?

A. Well, but that was a plot which was very much mutilated by pieces being taken out of it.

4316 Q. Have you made an additional allowance for plottage by reason of the entire ownership of these three blocks, 688, 689, and 690?

A. One reason was that many of these lots are further away from Tenth Avenue; it is a much longer block.

Q. But taking the blocks the same distance from Tenth Avenue, did you not make $9,500 the valuation in each case?

A. The average valuation.

Q. $9,500?

A. Yes.

Q. But you made it for each individual block, $9,500, did you not, in giving your valuation?

A. I did, that is about the value there.

Q. But they do become more valuable above 18th Street?

A. I think they are becoming more valuable as you get above 18th Street, as you approach the ferries, but not very much.

Q. I see in Block 691, which is between 19th and 20th Streets, you still keep the value of the interior lots in your estimate at $9,500?

A. Yes, but that was on account of the poor condition of the street, I think; some of those streets are in a terrible condition.

Q. But are not the lots in Block 691 very close to the marginal street?

A. Yes, they are.

Q. And that marginal street——

A. But my recollection of that is that it was a very disagreeable neighborhood there at the present time, exceedingly disagreeable neighborhood. You could not cross the street on account of the water in the street; I think that is the street.

Q. What do you mean by water in the street?

A. Well, they are improving the marginal street, and the water had come down one of these streets and formed quite a puddle.

Q. You mean one of the side streets?

A. I mean one of the side streets.

Q. But you would not take that as a controlling feature, a temporary puddle like that?

4317 A. It is temporary, but the general appearance of the neighborhood; the neighborhood in some of those streets is very bad.

Q. But is it any worse in 20th Street than it is in 19th Street?

A. Yes, I think so.

Q. On the marginal street?

A. Yes, that is my recollection; the marginal street is not improved all the way along there.

Q. But it is in process of being improved?

A. Yes, there is some work being done, but the City is doing it very slowly in some parts.

Q. Has there not been a very great increase in value in the last two or three years from 19th to 23d Streets?

A. Not so much in the side streets as there has been upon the marginal street and Tenth Avenue.

Q. Yes, but between 10th Avenue and the marginal street, it means an increase in value, provided values increase in both Tenth Avenue and the marginal street, of course?

A. But the increase has been mostly east of Tenth Avenue.

Q. Is it not true that if you have a large increase in value in two avenues, that the side streets running through from those avenues also increase in value?

A. That is generally the case, yes, sir.

Q. Block 716, which is 75 feet wide only, you estimate at $12,000 per lot?

A. Yes, that is between Ninth and Tenth Avenues.

Q. Is the reason for that difference the fact that it is located between Ninth and Tenth Avenues instead of between Tenth Avenue and the marginal street?

A. Not at all. That land is upland, it is not filled-in land. Much of the land I have been talking of is filled-in land. This is above high water mark.

Q. Is it not a fact that the land in the blocks west of Tenth Avenue abut on a street which has a water front, an element in determining value?

4318 A. Yes, sir; a business street; the marginal street will be a great business street.

Q. Is it not true, too, that the greater part of the water front property of New York, which faces on marginal streets is located on filled-in-land?

A. A great deal of it, and it must necessarily be so, but it affects the value on side streets.

Q. What valuation did you place on Block 715, which is directly across the street from Block 716, per lot?

A. I think about the same value; the same value.

Q. Just $12,000 a lot?

A. $12,000 a lot.

Q. Does not the fact that there is quite a large parcel in Block 715 add to its value on account of plottage?

A. Well, I think that $12,000 is the value of a lot, when you consider plottage added—plottage is such an indefinite term——

Q. Have you a record of any vacant lot in the immediate vicinity between those two avenues which sold within the last year for $12,000?

A. No, I do not know of any vacant lot in that plot that sold at that price. I don't know that there are any vacant lots to be sold, excepting these, that is, that could be sold without buildings upon them. The sales that have taken place there, with the exception of one, 110 West 18th Street, which sold for $12,100 in May, 1906, and that had a three-story and basement tenement house on it, were for nominal consideration, as I find them; I have one sale, 410 West 18th Street, which sold for $12,100.

Q. When was that?

A. March 30, 1906, 129 feet 6 inches west of Ninth Avenue.

Q. To whom was that sold? Have you the record?

A. It was sold to the Prudential Real Estate Company.

Q. It was sold in foreclosure?

A. It was sold in foreclosure, yes, sir.

Q. Have you any record of any sale—private sale—by ordinary negotiation? 4319

A. I have not except at nominal considerations.

By the MASTER:

Q. Was that a full-sized lot?

A. No.

By Mr. MATHEWSON:

Q. What was the size?

A. It was 20 feet 6 inches by 92 feet.

Q. Your estimate of $12,000 is for a 25-foot lot?

A. Yes.

Q. With a depth of 92 feet?

A. Yes.

Q. I see in this Block 951, on the south side of East 21st Street, west of Avenue A, Block 952, between 20th and 21st Street, west of Avenue A, and Block 953, between 21st and 22d Streets, west of Avenue A, you appraised interior lots at $7,500?

A. So it seems.

Q. Can you point out any sale of lots within the last year in that vicinity at $7,500 equally well located?

A. Perhaps not within the last year.

Q. Well, have you not a sale which took place in 1904, 436 and 438 East 19th Street——

A. I have 426.

Q. 50 by 92 feet, vacant lot?

A. No, I have not that. I have a sale of 426 which took place in 1905.

Q. You have not the record of 436-438 East 19th Street between First Avenue and Avenue A?

A. No, 508-510 I have.

Q. Sold in March, 1904?

A. Well, sold in June, 1906, that is the only sale I have. That is not an actual consideration.

Q. Well, have you not your records for 1904 here?

4320 A. These records were prepared from the Real Estate Record, the records for 1904, 1905, 1906, were all examined, and those that have actual considerations were culled out of the Record.

Q. Have you not made any examination except from the Real Estate Record?

A. I cannot interview the buyers.

Q. Don't you in any case where the Real Estate Record shows a nominal consideration, ascertain frequently what the actual consideration was?

A. So far as we are able in our office; we have not time to run around and interview the buyers; there is no other way of doing it. We approximate the value, considering the mortgage upon the property very often.

Q. Well, the mortgages upon the property are placed at various per cents. of the true value, in accordance with the prudence of the lender and the rate of interest he gets, are they not?

A. That is true. You can find out the limit both ways of loaning and come to a conclusion as to what amount was the percentage that was loaned upon the property; that is the only way.

Q. I find I have a memorandum of the sale of 436 and 438 East 19th Street, between First Avenue and Avenue A, 50 by 92 feet, vacant, at $16,100, or $8,050 per lot in March, 1904. Won't you see if you can find that?

A. I have not it.

Q. If that sale be genuine at that price, that would represent a larger price per lot than you h[illegible] assumed for the interior lots in any one of these lots, would it n[illegible]?

A. Was it vacant?

Q. Vacant.

A. Was it an exchange?

Q. A sale, as I have it.

A. I know, but you cannot judge from that.

Q. I say, assuming it to be so, that would be a higher valuation than you make now?

A. It would be mathematically a higher valuation.

Q. And you have said that property has increased in value within the last two or three years?

4321 A. I did not say it had increased here in value. I said there had been a general increase in the value of real estate.

Q. Has there not been a general increase in value——

A. Not in all real estate.

Q. Let me finish my question. Has there not been a general increase in value in this particular section, East 23d Street and north and south for several blocks within the last three years?

A. You were questioning me on 19th Street.

Q. Yes, I say north and south from 23d Street for several blocks?

A. Not a very large increase.

Q. Didn't you allow an additional allowance for plottage here by reason of the fact that the company owns the entire block in one case and virtually the entire Block 953?

A. I am not talking about different blocks.

Q. I am going to name it.

A. You are through with 951?

Q. My inquiry was as to all three, because you claimed $7,500 for an interior lot in the case of all three blocks, 951, 952 and 953, and I was saving time in taking them together.

A. I did not comprehend your question.

Q. I ask you whether you have made an allowance for plottage by reason of the fact that Block 951 and Block 952, which is nearly an entire block, and Block 953, which is the entire block, were all in the same ownership?

A. I do not think plottage would apply in the same way.

Q. Why not?

A. Because after you own so much property the plottage begins to cease; the ownership of so much creates a dull neighborhood.

Q. You would not call it dull around the gas plant, would you?

A. Not in the smell, it is not; it is a dull neighborhood; while all that property is occupied for gas purposes, it is a dull neighborhood.

4322 Q. Do you mean to say that the ownership of all this property on East 20th Street and 21st and 22d Streets in a single ownership does not add to the value of that property in the hands of the owner?

A. No, I do not think the plottage applies beyond the block.

Q. You read what other witnesses said, did you not, in which they——

A. I know, but I am not praising the other witnesses.

Q. I know, but I ask you if you did not read what they said?

A. I read it.

Q. Well then, do you disagree with them on that subject?

A. I think I disagree with them on that.

Q. Did you observe that Block 951, which you valued at $52,500, was assessed at $50,000, or substantially what you appraised it?

A. Yes.

Q. And did you observe that Block 952, which you valued at $333,800, was actually assessed at $340,000, or something more than your appraisal?

A. I did.

Q. Did you observe that Block 953, which you appraised at $435,700, was appraised for taxation at $500,000?

A. Yes, sir, I observed it.

Q. And in spite of the fact that you have been connected with the Tax Department, that has not any influence on your judgment?

A. I did not make assessed values in the Department. Deputies are employed to do that, sir, and it shows how they differ. It is a difference of opinion.

Q. So, too, taking Blocks 979, 978, 987, which are in a single ownership, you think that the single ownership does not add to the value of three blocks aggregated on the basis of plottage, do you?

A. Not beyond the block, not beyond the individual and particular block.

Q. And did you observe that Block 978, which you valued at $368,265, was assessed at $369,000, or a little more than your value?

A. Yes, it is assessed about $750 more than my valuation.

4323 Q. Did you observe that Block 987, which you valued at $88,000, was assessed at $86,000?

A. Yes, but in that case the city assessed less land than I did.

Q. The tax map of the city shows lightly less in that case, does it?

A. Yes.

Q. How much?

A. Well, it shows that there is a strip along that lot 23 feet 9⅜ inches at 20th Street and 7 feet 6½ inches at 21st Street. It was assessed by the City of New York, and I do not make the city's assessed value what you do. I find it to be $79,700 for the part that the city assessed as gas company property.

Q. What is the $86,000, the assessment of the whole block?

A. I presume so.

Q. Well, we think we own the whole block?

A. I gave you the benefit of it.

Q. You did not find anybody else in possession between ourselves and the street, did you, no business going on?

A. I don't know whether your fence along there—there is a large board fence along there; I don't know whether it is on the line or not. There is in that neighborhood a strip that has not been asphalted. The rest of the marginal street is covered with asphalt, but there is a strip there between the fence that is not improved.

By Mr. PAGE:

Q. And that is the portion that is assessed to the City, is it?

A. That is the portion that the assessment really says is assessed to the City of New York, but I have included that in my valuation of the whole plot.

By Mr. MATHEWSON:

Q. Of Block 987?

A. Block 987. I plotted that with that in.

4324 Q. Do you think that the proper way to sell Block 987 is to divide it into only two parcels instead of selling it off into blocks?

A. I do, most decidedly; I am positive on that.

Q. Will you refer to page 5 of the Exhibit 48 and take Block 1089?

A. Yes, sir.

Q. Between 41st and 42d Streets?

A. Yes.

Q. Running west from Eleventh Avenue, you took the block as extending only to the line of Twelfth Avenue, did you?

A. In my estimate I did.

Q. Did you find the Company in possession of the land clear through to the bulkhead line?

A. I don't know. I passed through the Albany Day Steamboat Line.

Q. Didn't you observe the Company was in possession of all that property with merely a right of way, which has been described in evidence, to the steamboat line?

A. I found a tramway for coal extending over what would be Twelfth Avenue.

Q. Used by the Company, apparently?

A. I presume so. It was not in operation when I was there.

Q. Was the property fenced in at all?

A. The property was fenced in. There was a passageway.

Q. Including the street, except the passageway?

A. I don't know as to the location of the fences, whether they are on the line of the avenue or not.

Q. Well, it was apparently fenced in, as near as you could judge?

A. But approximately the easterly fence was on the line of the avenue.

Q. You appraised the pier there, and the water rights?

A. No, sir, I went in the ferry house and examined it.

Q. You give there only $11,500 as a valuation for the interior lots on 42d Street?

A. Yes, sir.

Q. Isn't property on 42d Street increasing in value?

A. It is going to increase in value there. It has not increased much yet, but it is going to.

Q. There is a ferry located there, isn't there?

A. Yes, sir.

4325 Q. Have you a record of any sale of a lot on 42d Street or thereabout within the last year at as low a price as $11,500?

A. I have a record of a plot 19 feet 7 inches by in depth half the block, with a four-story stone front dwelling on, which sold in 1904 for $10,700.

Q. Where was that?

A. No. 526.

Q. You haven't any nearer record than that?

A. I have a record in 1905 of No. 417, having been sold in January, 1905. The lot was 20 by 100 with a four-story brick tenement and store, sold for $16,500.

Q. Auction sales?

A. No, sir; executor's sales.

Q. Not at auction?

A. Apparently not, sir.

Q. Would you be sure they were not executors' sales made at auction?

A. If they were it would still further confirm my opinion that it was a fair price, because executors' sales at auction bring better prices than executor's sales at private sales.

Q. Has not property at 14th Street largely increased in value in the last three years?

A. No, but there is a better market for it and it is going to increase largely with the improvements that are going on there.

Q. Did you reckon the corner of Twelfth Avenue as a corner lot or as an interior lot in your estimate?

A. I reckoned it as an interior lot because of the ungraded condition and the unsettled condition of things right there. I could not arrive at it in any other way.

Q. Even if it be ungraded and unsettled is not the corner lot with the prospects that go with it on such a broad avenue as Twelfth Avenue, more valuable than an interior lot?

A. I am unable to appraise prospects.

Q. You do it every day, don't you?

A. No, sir.

Q. Is not the corner lot on an avenue such as Twelfth Avenue is laid out apt to be more valuable than an interior lot?

A. Yes, usually; but I have taken an average of the lots 4326 there of so much. I do not say that each lot is worth that.

Q. Do you mean to say that interior lots, if you were to define these lots, are actually worth less than $11,500 and the corner worth more?

A. On account of the conditions there I do not believe that any of that property would bring any more money than I have placed the valuation at. There is a bad neighborhood back of it.

Q. Don't you think a corner lot, assuming as you did it is not a corner yet, and having it understood, as you did, that Twelfth Avenue was to be opened on a city street, and that it did not belong to the gas company, would bring more than an interior lot?

A. Probably it would. But there is no physical corner there yet.

Q. Well, we must assume the one thing or the other, that the street belongs to the company or that it does not, and if it belongs to the city you have a corner lot?

A. I would naturally face those lots on 42d Street and not on Twelfth Avenue and I took the entire plottage on 42d Street and appraised it at so much a lot.

Q. But if Twelfth Avenue were to be cut through would not the lots there naturally be faced on Twelfth Avenue in that case?

A. No, sir; they would still be faced on 42d Street.

Q. How about being faced on 41st Street. Wouldn't that half of the block face on Twelfth Avenue if you were to plot it after Twelfth Avenue were cut through?

A. If any one was selling that property they would not sell less than 100 feet square on 41st Street. Then a man could face his lot either way as the development justified.

Q. Would not the development as a rule and in your judgment justify facing the lots on Twelfth Avenue, for the half of the 4327 block from 41st Street to the middle line?

A. Not in the immediate future.

Q. Not even if Twelfth Avenue were cut through?

A. No, because there have got to be a great many other changes in that neighborhood to make Twelfth Avenue of any importance. The slaughter houses on 41st Street have a very bad effect upon all property in that neighborhood.

Q. Do you mean to say that a corner lot on 11th Avenue is now only worth $17,500, in your judgment?

A. In that neighborhood?

Q. Taking Block 1071, across 11th Avenue, you have 4 lots which you appraise at $50,000, or $12,500 per lot?

A. 1071, yes, sir; $12,500 per lot.

Q. Are lots worth more there?

A. They are.

Q. Than they are nearer the ferry?

A. On that side of the street.

Q. On the north side of the street—on that side of the street they are worth more?

A. Business side of the street there.

Q. How about their proximity to the ferry; does that add or detract from their value?

A. It does not add very much. People that go to the ferry pass by without stopping in the stores.

Q. Does it add anything?

A. It may add something. There may be some transient trade there.

Q. Wouldn't you say it added something?

A. Very little.

Q. Wouldn't you say it added something?

A. It might add something.

Q. Then won't you look at plot 1091 which is nearer the ferry, between 11th Avenue and the ferry, north side also, 150 feet, or six lots. You valued that at only $12,000 per lot although it is nearer the ferry, as against $12,000 for Block 1071, which is on the north side of the street as well. Why should that be?

4328 A. Well, while they were nearer the ferry I did not consider the lots were as good lots as the others.

Q. Why not? There is just as much land in them?

A. Just as much land but a much poorer bottom to build on.

Q. Isn't it made land in each case?

A. There is not so much made land in 1071 as there is in 1090.

Q. Isn't it made land?

A. No.

Q. Are not all the lots on 1071 located in made land?

A. I think not, sir. I think they are east of the high water mark and north of the little stream that ran in there originally.

Q. Now, turn to page 6, Blocks 1092, 1093, 44th to 46th Street, between Eleventh Avenue and the North River. You did not in taking these two blocks either make any valuation for a corner lot facing on Twelfth Avenue, although you excluded Twelfth Avenue from the ownership of the complainant company, did you?

—. I did not.

Q. I see that you value interior lots in Block 1093 at $7,500?

A. Yes, sir.

Q. And also in Block 1092?

A. Yes, sir.

Q. Are lots on 44th, 45th and 46th Streets all of the same value?

A. About the same value. I judge so.

Q. Can you give me a record of a sale of any lot within the last year in this immediate vicinity at as low a figure as $7,500?

A. There was a sale of No. 499 West 44th Street; it sold for about $9,500, as far as I can figure it.

Q. Between what avenues is that?

A. It was 200 feet east of Tenth Avenue.

Q. A 25-foot lot?

A. No, a 20-foot lot by 100 feet 4 inches, and had on it a four-story brick tenement.

Q. Was that an auction sale?

A. It does not appear to be.

4329 Q. Do you know whether it was or not?

A. I do not know. I think it is a private sale.

Q. Are you not familiar with sale of lots on Eleventh Avenue, 617 to 621, between 45th and 46th Streets, vacant, in 1906, at the rate of $12,000 a lot?

A. No, I have a record of a sale in 1905, 617 to 621. There was a two-story brick dwelling on it.

Q. At what figure?

A. Nominal.

Q. Well, haven't you a record of those sales, 1906, the house being vacant or abandoned, at $37,000?

A. No, I do not appear to have that, sir.

Q. Will you turn now to page 7 of Exhibit 48 and consider Block 1457?

A. Yes, sir.

Q. Where you appraised street lots at $8,000, if I am correct. Will you see if I am?

A. I appraised the lots on 63d Street at $8,000 and those on 62d Street at $7,500.

Q. Why the difference?

A. 63d Street is a better Street.

Q. Well, you appraised the lots in Block 1455, which is between 60th and 61st Streets, at $6,500, on the street, did you not?

A. Yes; a different location of the street.

By the MASTER:

Q. I understand that in that block also that any allowance you made for plottage is included in your price per lot?

A. Yes, sir.

By Mr. MATHEWSON:

Q. How much did you allow for plottage in this case?

A. I cannot separate all the different elements in this case, Mr. Mathewson. Probably in the neighborhood of 5 per cent.

Q. Did you make any individual figures first and then add 5 per cent.?

A. No, I did not.

Q. Is the same true of Blocks 1092 and 1093 respecting
4330 which I called your attention a few moments ago?

A. Yes.

Q. You say that the property between 60th and 61st Streets is not so well located as on 62d Street or 63d Street, but hasn't it an additional element of value as property facing on Avenue A or nearer Avenue A?

A. Yes, and I have allowed for that.

Q. But even after allowing for that you gave a lower rate per lot?

A. For the back lots, further back. There were conditions there that justified that difference in the value. There is a great deal of rock on the lots on 61st Street; that is one reason; 6 or 8 feet of rock.

Q. How does rock affect the value of lots as compared with made land?

A. It is a more solid investment.

Q. Is rock more deleterious in estimating the value of the lot than the fact that a lot is made land?

A. It depends a great deal upon the man and the rock. I can give you examples both ways.

Q. Are you familiar with the sale of 417 East 61st Street, which was directly opposite the gas property, with an old two-story house of little value, 25 by 98 feet, under foreclosure, in 1906?

A. I have a record of that sale.

Q. It sold for $9,000, didn't it?

A. It sold for $9,000; a two-story frame tenement on it.

Q. Don't you recall that that two-story building was of very slight value?

A. I don't remember the building.

Q. A two-story frame tenement building would not be a very valuable building, would it?

A. Not very.

Q. Are you familiar with the sale of No. 1108 First Avenue, between 60th and 61st Streets, in 1905, a one-story shed only on the land?

A. No, sir, I am not familiar with that. I would have had it if it had an actual consideration, I think.

4331 Q. Well, have you any record of the sale of 1103 Avenue A, recently?

A. No, sir, I have not.

Q. At $23,500?

A. Oh, that had a large tenement house on it.

Q. Well, whatever it had I am referring to the sale of that number?

A. I think I have seen that sale but I have not a record of it here.

Q. Wasn't that an old tenement house?

A. No, sir; I think not.

Q. Do you know the value of the tenement house on it?

A. No, sir; I made no examination of it.

Q. Now, will you look at Blocks 1177 and 1157, on page 8 of the Exhibit 48. If I understand you correctly street lots, interior lots in Block 1177 west of West End Avenue you apprasied at only $5,000, while between West End Avenue and Amsterdam Avenue in Block 1157 you appraised them at $8,000?

A. Yes, sir.

Q. Do you mean to say there is any such difference?

A. Yes, sir.

Q. (Continuing:) As 62½ per cent. in the value of interior lots?

A. I think so, sir; because these lots abut up against the railroad track. The railroad track is against the grade of the street, but you cannot cross the track; it terminates in a *cul de sac.*

Q. But it is open at one end, across West End Avenue?

A. Oh, you can go out on West End Avenue, but it is not a continuous street, it is only 34——

Q. You think the interior lots in Block 1177 west of West End Avenue are worth only 62½ per cent. the value of lots in Block 1157?

A. Yes, because the other part is a built up neighborhood and is a continuous thoroughfore.

Q. You give the corner of Amsterdam Avenue in Block 1157 as $25,000 and the lot next to it as only $12,500, if I understand you correctly?

A. Yes, because I think very large corners would have that difference in value.

4332 Q. But don't you think that the lot next to the corner has a greater value than 50 per cent. the value of the corner?

A. 50 per cent. is usually considered a very high addition to make for the corner; usually 33⅓ to 50 per cent.

Q. But if you took the lot next to the corner at $12,500 and added even 50 per cent. to it, it would make a value of only about $18,000 for your corner instead of $25,000, wouldn't it?

A. Yes, but that is a built up neighborhood there and there are new buildings going up there and it is quite prominent; that makes the increased value.

Q. You gave the value of a corner as $25,000?

A. Yes, sir; and $14,000 for the next lot.

Q. $11,000 less for the next lot?

A. That is what I did there.

Q. Well, that isn't the proportion you carried in estimating the lot next to the corner in other cases, is it?

A. Not always; no, sir.

Q. For instance, in Block 1683, you took a corner at $15,000 and the lot next to the corner at $12,000?

A. There is no universal rule. It all depends on judgment.

Q. And in Block 1704 you took the corner at $13,500, and the next lot at $11,000?

A. There was some reason for it when I went on the ground.

Q. What is the special reason for reducing lots next to the corner on Amsterdam Avenue, which is a business street, to one-half the value of the corner lot?

A. I cannot tell what it is now, for I have not the memorandum, but there was something that induced me to do it when I visited the property.

Q. Amsterdam Avenue is a business Street?

A. Yes, a business street.

Q. A broad avenue?

A. A broad, 100-foot avenue.

Q. Doesn't it seem to you an excessive reduction without some special consideration that you have in mind unless there was a good reason for it?

4333 A. I cannot recall the reason. There was a good reason for it at the time.

Mr. Page: Would it be a special reduction, or an excessive valuation of the corner over the next lot?

Mr. Mathewson: Well, I am quite willing to have that question put.

Q. Referring to your appraisal of lots in Block 1177 at $5,000, as being west of West End Avenue, are you familiar with the sale on 66th Street, only 50 feet east of the railroad track, 40 by 100, in May last, for $13,000 or at the rate of $8,100 per lot, vacant, directly across the street from these lots you appraised for $5,000?

A. No, I haven't any such sale.

Q. Well, if lots were selling on the north side of 66th Street, west of West End Avenue, at $8,100 per lot, the lots on the southerly side would be worth more than $5,000, wouldn't they, directly across the street?

A. If they were selling for that, but I don't think that sale is the evidence of their value, for I don't know anything about the sale.

Q. Now, turn to page 9 of Exhibit 48, Block 1670, between 98th and 99th Streets, First Avenue and Second Avenue. What did you allow for plottage by reason of the ownership of the entire block by the Company?

A. I am unable to separate the plottage from the amount that I have placed upon the lots. That is, I am unable to separate it as a distinct item.

Q. Is the same true as to Block 1692 across the street?

A. Yes, sir. I don't think anybody can separate them.

Q. In Block 1670 you figure a corner at $14,000 on First Avenue, as I understood you?

A. That is true.

4334 Q. And Block 1692, just across First Avenue, you figure a corner on the same avenue at $13,000, would you not?

A. So you would on Broadway.

Q. I merely ask you whether that is the case?

A. Yes, sir.

Q. Do you consider the easterly side of First Avenue less valuable than the westerly side there?

A. I do.

Q. Isn't one side as much a business street as the other, above or below the gas works?

A. Just about, now. There is very little business there.

Q. You figured street lots on 88th and 89th Streets west of First Avenue at $7,500, and street lots——

A. One moment. I figured lots on 98th and 99th Streets, between First and Second Avenues——

Q. At $7,500, interior lots, did you not, the cheapest lots?

A. Yes; I averaged them at that.

Q. And you figured them across First Avenue, Block 1692, on the same streets, at only $5,000?

A. That is true; a very different character of lots there.

Q. Do you mean 50 per cent. should be added to the value of lots in one block to represent the actual value of similar lots there?

A. I think so there, when you consider the character of the soil and the location.

Q. Isn't the property between First and Second Avenues made land, to a considerable extent?

A. Between First and Second Avenues?

Q. Yes.

A. Yes; there was an old brook or stream ran up there.

Q. And also it is made land between First Avenue and the River where you gave your $5,000 lots?

A. That is true.

Q. The foundation is just as good in one place as in another?

A. No, hardly.

Q. Well, why not?

A. Oh, there were other elements that came in.

4335 Q. Is not the fact that the property abuts this marginal street and is next to the bulkhead line one element in favor of value in Block 1692?

A. It is.

Q. And still you put the interior lots in 1692 at $5,000 against $7,500 in 1670?

A. 1692?

Q. Yes.

A. I think not, sir.

Q. Well, let us see if you did not?

A. That is the block fronting on marginal street and I divided that in large parcels.

Q. Didn't you give any valuation for it individually, interior street lots there?

A. I think not, sir. I estimated 1692 in this way——

Q. The question was whether you did not estimate the interior lots or some of them there at $5,000?

A. I made the plot northwest corner of marginal street and 98th Street $38,000, and on that plot I divided the frontage on marginal street by the center of the block.

Q. And you had certain lots figured in this Block 1692 at $5,000, did you not?

A. I think not in my testimony, sir. I testified that there are 10,877 square feet in the northerly portion and 10,860 feet in the other.

Q. You gave a corner lot in 1692 at $13,000 and some street lots at $5,000, unless my figures are wrong?

A. Ah, on First Avenue?

Q. Yes.

A. Oh, I thought you were talking about the portion fronting on marginal street.

Q. Oh, no.

A. On First Avenue I appraised southeast corner of 99th Street at $13,000.

Q. And you had interior lots there at $5,000 each, did you not?

A. No, not on the First Avenue front.

Q. No, but street lots?

A. Yes, between the rear of those lots and the rear of the marginal street lots.

Q. And these are the ones I am comparing with $7,500 street lots in Block 1670?

A. Yes, that is true.

4336 Q. Now, are you familiar with the sale of 227 to 231 East 98th Street in 1905, 75 by 100 feet, with sheds only, at $40,000?

A. I have a record of it here, for a nominal consideration, which is subject to a mortgage of $5,000.

Q. Don't you know that the sale of the three lots 75 by 100 feet was $40,000?

A. No, I do not. The record shows it was sold subject to a mortgage of $5,000 for a nominal consideration.

Q. And you made no investigation, I suppose, further than observing the record, did you?

A. That is all, sir.

Q. Now, take page 10, Block 1683, northwest corner of First Avenue and 111th Street.

A. Yes, sir.

Q. Do you figure a corner there at $15,000?

A. That corner, yes, sir; because it was opposite to the entrance of Jefferson Park; I gave a special value for it there.

Q. Well, Block 1682, which is the block immediately below, you figure the corner at $17,500, do you not?

A. Yes, that is opposite Jefferson Park, too, but it is a better street.

Q. What is a better street?

A. 111th Street.

Q. But 111th Street, the northwest corner of 111th Street, which you figured at only $15,000 is on the same side as the southwest corner of 111th Street, both being on First Avenue?

A. Both on First Avenue, but there is that difference in my opinion in the value of the two parcels.

Q. How so, because they are on the same street at exactly the same point, are they not?

A. Yes.

Q. Both on First Avenue and 111th Street?

A. Yes, sir.

Q. And you have stated the fact that the northwest corner is opposite this park makes it more valuable than it is otherwise worth and yet you have appraised the southwest corner at $17,500 and
4337 the northwest corner at only $15,000?

A. And I presume I should have reversed them. I made them on a general diagram and may have copied them incorrectly. Those are the values of those two corners.

Q. Is that the only explanation you can now give?

A. That is the only explanation I can now give.

Q. I see you value interior lots on Block 1683 at $7,500 and interior lots on Block 1682 at $8,500, $8,500 on 110th Street; is not 111th Street as good a street as 110th Street?

A. 111th Street is a better street.

Q. Then why do you appraise interior lots on 111th Street, on Block 1683, at only $7,500, while you have interior lots on 110th Street, in Block 1682, appraised at $8,500 or a thousand dollars a lot more?

A. Well, 1863 is between 111th and 112th Streets, and 1682 is between 110th and 111th Streets.

Q. Quite so, but I am taking the lots facing on 110th Street out of Block 1704, and you appraise those at $8,500, although you appraised the lots in Block 1683 facing 111th Street which you say is a better street at only $7,500?

A. That is true. There were only two of them, though.

Q. The fact that there were only two would not make the thousand dollars difference in a lot, would it, in a better street?

A. I found I did not make it exactly that. I appraised the seven lots, giving an average of $7,500, including a portion of the land on 112th Street.

Q. Well, there are only two lots on 112th Street?

A. Yes.

Q. That is a very small part of the entire plot?

A. Yes, and I made an average of all the lots there, seven of them, at that figure.

Q. Now, don't you think that the lots on 111th Street facing this park are worth more than $500 beyond the value of lots on 110th Street?

4338 A. No, I think that is about the difference between the two.

Q. Now, look at Block 1704 a moment, which is directly opposite the park. There you have appraised interior street lots on 110th Street, if my figures are correct, at only $5,500, whereas you have appraised the interior street lots on 110th Street in Block 1682 just across First Avenue at $8,500?

A. Yes, but this block is a very poor block in comparison.

Q. Which is?

A. 1704.

Q. But that is opposite the park, isn't it?

A. A portion of it is.

Q. Isn't it all opposite the park?

A. No, it is not.

Q. Well, facing the park?

A. Oh, the whole block looking at it one way is, but the entrance to the park is through 111th Street; no entrance to the park through 110th Street.

Q. But the block is opposite the park for its whole extent?

A. Yes; the 111th Street front is.

Q. Now, taking Block 1682 on 110th Street, you give the value of interior lots between First and Second Avenue as $8,500?

A. Yes.

Q. But the interior lots in Block 1704 on 111th Street which face the park you give at only $7,000?

A. That is so.

Q. Why is that if it is more valuable? Because it faces the park?

A. I did not say that it was more valuable than the lots on the other block there. I said they were more valuable than the lots on 110th Street on the same block.

Q. You don't think, then, being opposite the park makes the lots any more valuable than they are on the opposite block?

A. More valuable than the lots on 110th Street in that neighborhood.

Q. Can you point out the sale of any lot within the last
4339 year in that vicinity at as low a price as $5,500?

A. On the streets?

Q. Yes, any full lot at a figure as low as $5,500?

A. The only sales I have in that locality during the past year are sales of plots upon which buildings were situated.

Q. Now, let me call your attention to this; aren't you familiar with the sale of 308 to 320 East 110th Street, west of First Avenue and directly opposite?

A. I thought you were asking me about First Avenue.

Q. No, I am asking about the street, 175 by 100, 308 to 322 East 110th Street, with only sheds, selling in 1905 at $74,550, or at the rate of $10,650 a full lot.

A. No, I am not.

Q. Don't you find a record of the sale of that property in November, 1905, on your memoranda?

A. No, sir.

Q. I have another record of a sale, 324 to 326 East 110th Street, west of First Avenue, and also directly opposite the Gas Company's property, 50 by 100, with sheds only, as selling in July, I think in 1905, at $19,300, or at the rate of $9,600 per lot. Cannot you find a record of that in your memoranda?

A. No, I haven't that record.

Q. Can you point to any sale?

A. No, I cannot.

Q. Now, will you turn to page 11 of Exhibit 48, Block 1999. There you appraise the interior lots at $6,000 per lot. Can you give me any sale in the immediate vicinity within the last year at as low a figure as $6,000 per lot, between 132d and 133d Streets, east of Twelfth Avenue?

A. No, the nearest sale I have made was on the corner of Broadway and 132d Street. I sold four lots there in October.

Q. At 132d Street?
A. And Broadway. That is my nearest sale.

4340 By Mr. Page:

Q. Was that the Boulevard or old Broadway?
A. The Boulevard. That is a sale I made myself.

By Mr. Mathewson:

Q. Have you a record of a sale on the south side of 132d Street, midway of the block, between Broadway and Twelfth Avenue?
A. No, I have not.
Q. 130 by 100, vacant, sold in 1904?
A. No, I have not. I have not the records with me as far north as that.
Q. You haven't any record of a sale there at $8,800 per lot?
A. Not with me.
Q. Property in that neighborhood has been increasing the last two or three years?
A. Very much indeed, on the Boulevard and near the subway stations.
Q. And between the Boulevard and Twelfth Avenue?
A. Not so much, excepting in very good blocks there have been a great number of sales, large amount of building.
Q. This property is located very near the Boulevard and runs through to Twelfth Avenue, Block 1999?
A. It has great disadvantages, such as the Riverside structure—the viaduct on Twelfth Avenue and the viaduct portion of the subway on the Boulevard and then it descends very abruptly from 133d Street south, and these streets descend abruptly to Twelfth Avenue.
Q. But all that property has partaken of the general advance in property, hasn't it?
A. Yes, but the property that has had the largest amount of advance has been property further north on the Boulevard.
Q. But the presence of the subway and the opening of the subway, even though it does crop out now and then, has on the
4341 whole increased the value of property in that section?
A. It has wherever the subway has been built.
Q. And it has been built right close to this property?
A. Yes, sir, very close.
Q. Now, will you take finally Block 2175, page 12, of the exhibit, which is an irregular piece, which you have appraised at $89,375.
A. Yes, sir.
Q. Is it not true that with the opening of the subway and general advance, prices have advanced in that section very largely in the last two years?
A. Very largely.
Q. Did you figure for a lot on Sherman Avenue, how much that would be worth?
A. Yes, sir.
Q. What did you figure a lot on Sherman Avenue to be worth?
A. I figured them to be worth what they sold for to-day, $5,500 apiece.

Q. $5,500 apiece?

A. Yes, what they have sold for to-day.

Q. On Sherman Avenue at this point?

A. Yes, sir, just about that point.

Q. Has not this plot a greater value than ordinary because of the fact that it fronts not only Sherman Avenue but has a large frontage on Kingsbridge Road?

A. The Broadway front or Kingsbridge Road front is worth about the same as Sherman Avenue. Perhaps—well it is a little further away from the subway station, but they bring about the same in the market, notwithstanding the fact that Broadway seems to be in much better condition.

Q. Now, Mr. Wells, on what basis did you value this property, on the basis of the presence of the gas works there?

A. That has something to do with creating the condition of any neighborhood.

Q. And if the Gas Company were to sell off for general improvements this property, thereby of course disposing of the gas works, that would immediately result in an increase, would it not? 4342

A. It would by the building operations that would come in that neighborhood.

Q. Would not it, by the very fact that the property was to be sold, thereby necessarily disposing of the gas plant, result in higher prices than you have estimated for the value of the property as it now stands?

A. I think I have given the fair market value of it to-day, even in——

Q. If the gas plant were removed from the property, don't you think it would sell for higher figures than you have given?

A. People in going around in this examination, people would speak about the gas plant being removed, and it seems to be pretty generally understood among them, and notwithstanding that fact, these values that I have given to-day are about the values that I think property is bringing in the neighborhood.

Q. You mean by private negotiation?

A. Private negotiation, although I think it probably brings better prices at public sale than at private negotiations.

Q. So at public sale if these plots were put up and sold, you think it would bring more than at private sale?

A. Yes, if the property were well advertised and you had a good auctioneer.

Q. You are not an auctioneer?

A. I am.

Q. Don't you think that 42d Street property next to the ferry, if it were known that the company's plant were to be removed and the neighborhood were to be improved in that regard, would sell for higher figures even at private sale than you have suggested?

A. I do not think the ferry is any difference there—makes any different conditions than the ferries do in the other streets in the city; the people rush past the property without improving it much in the way of trade.

4343 Q. Don't you remember they used to say the same thing about 42d Street and the Grand Central Station, that that was of no value, as a business street, because people rushed past it to the station?

A. Yes, but conditions have changed, there is a different class of people and different growth.

Q. And was not real estate very dead on 42d Street comparatively a few years ago on that account or for some other reason?

A. The subway has had a very beneficial effect, and the millions that have gone into new buildings have had an effect on 42d Street.

Mr. PAGE: And the general movement of business property uptown.

The WITNESS: I made an appraisement for the Rapid Transit Commission for the damage done by constructing the subway, and I made a pretty thorough examination of 42d Street at that time. Forty-second Street to-day is very different from what it was when the subway commenced.

Mr. MATHEWSON: That is all.

The MASTER: We will adjourn until 10:30 to-morrow morning.

Mr. BURR: I would like to have noted on the record before we adjourn, that the following directors of the Consolidated Gas Company were duly served with subpœna to appear to-day. Messrs. Sterling, Baker, Schermerhorn, Palmer, Tilford and Pyme. Of these gentlemen Mr. Schermerhorn actually did appear and was, at his own request, excused until 11 o'clock on Monday; so I ask that it be noted on the record.

Mr. MATHEWSON: Mr. Tilford called me up and said that the gentleman who served him said that he need not appear to-day unless it was convenient, and I told him under those circumstances I thought he would be safe in not appearing. 4344

Mr. BURR: I understand Mr. Sterling is to appear here at 11 o'clock to-morrow. If you can kindly arrange to have the other gentlemen here at the same time——

Mr. MATHEWSON: I do not think I can, for I do not know their addresses, and I am not in communication with them. I do not believe I can, really.

Adjourned to Wednesday, November 28th, 1906, at 10:30 A. M.

	2175—15, 18, 22, 100	89,375
	Total	$9,664,897.60

Mr. Burr: I wish to state, Mr. Master, that I have had a consultation with Mr. Mathewson and with Mr. Garver, relating to the statement printed in the *Tribune* which we offered in evidence here and which has been marked City's Exhibit 55; and, as I stated yesterday, we have already issued subpœnas to all the directors of the company so as to examine them with regard to the statements contained in that printed publication, but from my conversation with Messrs. Mathewson and Garver it seems quite likely that we may be able to arrive at a stipulation which will obviate the necessity of bringing those gentlemen here. We are all anxious to hurry the conclusion of this case, and everything that can be done to hasten its conclusion I know you will appreciate, so we have determined to ask you
4348 this: we will endeavor to arrive at a stipulation which will be entirely satisfactory during the morning session here, and ask for an adjournment until the afternoon.

Mr. Mathewson: I understand, Mr. Master, that these witnesses would take up considerable time if they were called, and I understand that counsel for the City is willing to proceed on Friday provided a stipulation is not reached to-day, so we would lose, perhaps, no time between now and Monday anyhow. That being the case, it seems to me that we might be justified in making no opposition to the request.

Mr. Burr: If we cannot arrive at a stipulation that will be mutually satisfactory, I will agree to go on and examine these witnesses

Friday. If we can arrive at a stipulation that will be mutually satisfactory, then, as I stated yesterday, I will be ready to proceed on Monday with the accountants.

The **Master**: The suggestion is you should have a recess, then, until one o'clock?

Mr. **Burr**: Say the usual time for re-assembling—2.15.

The **Master**: As to that, the suggestion was the other day that Mr. Mathewson expected to leave town this afternoon on an early train—four o'clock—and we would have to suspend a little earlier than usual. I think if you can get together on a stipulation you should be able to do it by half-past one and you can come in here at that time and proceed.

Mr. **Burr**: Yes, I think so.

The **Master**: Is Mr. Wells' examination completed? Is there to be any redirect from him?

Mr. **Kirby**: I understand his examination is completed.

The **Master**: Have you any other witness you can go on with now?

Mr. **Kirby**: I have not, sir.

4349 The **Master**: Well, then, under these circumstances there is nothing to do but to suspend until 1.30, and you can work on the stipulation meanwhile, if you can.

I desire to say to counsel again with regard to the suggestion of going on on Monday that I am entirely willing to sit Friday and Saturday, and I think it right that you gentlemen should recognize the importance of speeding this cause, because I am very confident it will not be possible to extend the time beyond December 10th, and, including Saturday next week, you have only six working days—Monday will make seven—and, allowing proper time for cross-examination, you gentlemen will have to get in the rest of your evidence much quicker than you have been doing lately.

Mr. **Burr**: We will be ready with the accountants' report Monday, both as to Exhibit 94 and the real estate account. The situation regarding the examination of the plant by additional engineers is unfortunate, but they have started. I have Mr. Lacombe and Dr. Marks, and Senator Page and Mr. Kirby have procured Mr. Edgerton; they are now examining the plants, so that it will be a matter that will later on appeal to the discretion of the Court if it is satisfied they are hastening such examination as much as they possibly can. With that exception we will close this case next week.

The **Master**: It won't appeal to my discretion. No further extension will be granted beyond the time I named, which I consider ample under the circumstances. If you gentlemen choose to work short hours and not work Saturdays, and spend time as you did yesterday putting in documentary evidence that might just as well have been put in at some other time, that is your look-out. If you get any further time it will have to be from the Court, and I doubt very much if you get it.

4350 Mr. **Burr**: Well, next week it may be necessary to work all night. It has almost gotten to that point now.

Recess until 1:30 P. M.

After Recess.

1:30 P. M.

Mr. **Burr**: I have consulted with Messrs. Mathewson and Garver, in pursuance of the arrangement made this morning, and we have finally arrived at an agreement which reads as follows:

Admission of the complainant, to be entered on the record, and in consideration of such admission the defendant, the City of New York, withdraws the subpœnas issued to compel the attendance and giving of testimony by the directors of the complainant on the subject of said admission:

First. Complainant concedes that City's Exhibit 55 (appearing on page 2965 of the evidence) fairly and truly stated complainant's attitude April 15, 1904, under the conditions which then existed, as to the proposed construction and use of the Astoria plant, and as to the other matters therein referred to, and same may be put in evidence of such attitude then and under such conditions.

Second. The so-called Remsen East River Gas Bill of 1904 did not become a law, and no similar legislation or bill has since been introduced or become a law.

Third. Complainant at the time of making of the oil contracts heretofore offered in evidence herein and marked City's Exhibits 10 and 30, had thirteen directors, of whom William Rockefeller was one, and said William Rockefeller was at the same 4351 time and still is a director in the Standard Oil Company, being the company with whom said contracts were made, but at the said time and for several months prior thereto the said Rockefeller was and had been in Europe.

Mr. **Burr**: I now offer in evidence the said City's Exhibit 55, heretofore ruled out, under this stipulation, as evidence of the attitude of the complainant then and under such conditions.

The **Master**: Was it ruled out or marked for identification?

Mr. **Burr**: It was excluded.

Mr. **Mathewson**: Then it may be marked in evidence.

Mr. **Burr**: It may be marked as received. The objection is withdrawn, as I understand.

Mr. **Mathewson**: We now offer it and we do not object, under the stipulation.

The **Master**: And it keeps its mark.

Mr. **Mathewson**: I suppose there is no objection to calling attention to the fact that this exhibit which has just been offered contains some errors not covered by the stipulation; *i. e.*, it refers to fourteen plants of the Consolidated Gas Company, which, of course, are a great many more plants than the Consolidated had; and I think it refers to the Astoria plant as being five times larger than any other in the world, which I think is perhaps out of the way in amount; at any rate, it is in evidence just exactly how many plants the company has and just how large the Astoria plant was.

Mr. **Burr**: Yes.

Mr. **Mathewson**: I call attention to that so that it may be observed.

Mr. Burr: That obviates the necessity for the calling and 4352 examination of these twelve witnesses for whom subpœnas had been issued, and many of whom had been served. I will be ready to — on Monday morning with the accountants.

The Master: You have not anything further this afternoon?

Mr. Burr: I have nothing further this afternoon.

The Master: Note on the record that Senator Page and Mr. Kirby are not present and have no witness, and there being nothing further ready we will adjourn until Monday morning at 10:30 A. M.

Mr. Mathewson: I understand that counsel for the defendants can have no testimony ready until Monday morning.

The Master: They so stated to me, that they could not go on until Monday.

Adjourned till Monday, December 3d, 1906, at 10:30 A. M.

Last Exhibits:

Complainants' 256.
State's Y Y.
City's 86.

4353 Circuit Court of the United States, Southern District of New York.

Consolidated Gas Company of New York, Complainant,
vs.
Julius M. Mayer, as Attorney General of the State of New York; William Travers Jerome, as District Attorney of New York County; Frederick E. Gunnison, John C. Davies, and Lucien L. Shedden, Constituting the New York State Commission of Gas and Electricity, and The City of New York, Defendants.

Before Arthur H. Masten, Special Master.

New York, *December* 3, 1906.

Met pursuant to adjournment.
Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Page.

4354 James Hall, recalled as a witness in behalf of the defendant, the City of New York, testified as follows:

Direct-examination by Mr. Burr:

Q. Where do you reside?
A. Philadelphia.
Q. What is your business or avocation?
A. Chartered accountant.
Q. How long have you been so engaged?
A. Between thirteen and fourteen years.
Q. Where, in this city or in Philadelphia?
A. In Scotland, England, Africa and America, and all over the States.

Q. Have you examined the books of many corporations of various kinds and descriptions?

A. Quite a large number.

Q. In the United States and in Europe and in other countries?

A. Yes, sir.

Q. Where did you graduate?

A. I am a member of the Institute of Accountants and Actuaries, Glasgow, Scotland.

Q. Any other societies or institutes?

A. No.

Q. On behalf of the City of New York, the defendant in this case, have you made an examination of the books of the Consolidated Gas Company for the year 1905 for the purpose of verifying the exhibit produced here by the complainant, known as Exhibit 94?

A. I have.

Q. What books did you examine?

A. I examined all the vouchers and ledgers, journals, consumers' ledgers, wages and pay rolls, labor tickets.

Q. How long were you engaged in this examination?

A. Between five and six weeks.

Q. Besides Exhibit 94, did you make an examination of the real estate account of the Consolidated Gas Company as it appeared in the books of the constituent companies? 4355

A. Yes, so far as we got those books.

Q. Did you also make an examination of the items going to make up the amount of three million and odd dollars as the same appears on Exhibit 80?

A. I did.

Mr. Mathewson: What is that?

The Witness: Sundry creditors, October 31st, 1905, I think it is.

Mr. Burr: The item of sundry creditors, $3,357,037.95, as it appears on Exhibit 80.

Mr. Mathewson: And what is Exhibit 80?

The Witness: I think that is your statement of operations, October 31st, 1905.

Q. Now, have you prepared a report as the result of the examination so made by you of the books of the company regarding Exhibit 94 and Exhibit 80, and the real estate account?

A. Yes, sir.

Q. Is this book which I hand you the report which you made?

A. It is.

Q. Do you remember what you found as the result of such examination to be the total cost of manufacturing and distributing gas sold to private consumers in the City of New York by the Consolidated Gas Company during the year 1905?

Mr. Mathewson: Just a moment. I think that that is a conclusion.

Mr. Burr: I was going to ask him how he arrived at it. I can either go one way or the other.

Mr. Mathewson: I do not think that is a proper question. This witness is not in the gas business and he cannot testify what should

4356 or should not be included, according to Mr. Marks' affidavit and testimony. He can testify, it seems to me, what the items are that he objects to, and we can determine whether they are properly chargeable or not.

Mr. **Burr**: He is testifying now as to what result he arrived at from an examination of the books of the Consolidated Gas Company, so far as Exhibit 94 is concerned, which he was authorized and instructed to do.

Mr. **Mathewson**: He was not authorized to draw these conclusions you have asked him, and this great big conclusion in one, it seems to me, is improper.

Question read.

The **Master**: You can modify that question so as to be unobjectionable, I think. In view of the rulings already made, I will let the witness testify as to what the results of his computation show from data derived by him from the books of the company, as to the cost of gas, if the theory on which he made these computations is also shown.

Mr. **Burr**: I will withdraw the question.

Q. What day was it you started in to make this examination?

A. October 12th.

Q. What was the first thing you did?

A. Called for the vouchers and ledgers.

Q. Did you make an examination of the vouchers?

A. We did.

Q. For what purpose?

A. For the purpose of determining whether or not they were proper charges against operation, in the manufacture and distribution of gas.

Q. What else did you do?

A. Checked all the postings of the operating ledger with the view of determining whether all the vouchers had been produced; tested the consumers' ledgers in order to test the quantity of gas sold and distributed.

4357 Q. Does this report which you have identified correctly set forth the figures which you obtained from the books of the company and the result of your examination of said books?

A. It does.

Mr. **Mathewson**: I do not think it is of very much importance whether it does or not. I assume you do not propose to try to offer that report here?

Mr. **Burr**: That is just what I do propose to do.

Mr. **Mathewson**: I shall certainly object to it. I do not think counsel or the Master will want to wade through that report and find what the witness finds in regard to Exhibit 94. I am not speaking for the Master, but so far as I am concerned I shall object.

Mr. **Burr**: On this record here now we have Yalden's report and you had in the Gas Commission Teal's report. Now we will have the report of these gentlemen who have been designated to examine the books of the company to verify your Exhibit 94.

Mr. Mathewson: We never had Yalden's report; you offered that yourself, and I think the Master suggested that it was of doubtful value, but he would accept it. We did not offer Teal's report. He was put on the stand by the Commission and testified.

Q. What does this report contain?

A. It contains the result of our examination of the books of the company in detail and our reasons for rejecting certain items improperly chargeable against the manufacture and distribution of gas, and our reasons for omitting others.

Q. There are certain exhibits attached to this report. Will you explain them, please.

4358 Mr. Mathewson: I object to this. The report that has been passed to counsel by the witness, I judge from its volume is certainly very voluminous. It does not seem to me it is very difficult to point out whether Exhibit 94 shows the actual facts, and secondly, what items in Exhibit 94 are objected to and excluded by this witness. Whether they should be excluded or not is another proposition, without going into this immense volume.

Mr. Burr: That is what I propose to do by first calling his attention to these exhibits.

Q. What does Exhibit B show?

A. Statement of the quantities of gas manufactured, purchased and sold during the year 1905.

Q. Are these figures appearing on these exhibits taken from the books of the Consolidated Gas Company?

A. They are.

Q. What does Exhibit C show?

A. Exhibit C represents Exhibit 94 submitted by the complainant, an exact copy.

Q. Just as it was submitted by them?

A. An exact copy.

Mr. Mathewson: What does it relate to?

Q. What does Exhibit D relate to?

A. The same exhibit amplified and showing our adjustments.

Mr. Mathewson: What was Exhibit C?

The Witness: Exhibit 94.

Q. You might explain a little more in detail what you mean by showing your adjustments, as I understood you, referring to Exhibit D.

Mr. Mathewson: We are going to mix up the record dreadfully, if I may suggest it, because we have already Exhibits C, D,
4359 and so forth. Why not call it Schedule C, or something like that.

Mr. Burr: I think I made it distinctly understood that I was referring to the exhibits annexed to the report which he has in his hand, and which he has spoken of as having been made from the books of the company, and I am now referring to Exhibit D, which he says shows the summary of the operations for the year ending October 31st, 1905, amplified and adjusted.

Q. I ask you to be a little more specific as to what you mean by amplified and adjusted.

The MASTER: Is not this getting at it a little wrong-end-to, so to speak? I understand Mr. Mathewson's objection, and it seems to me it is entitled to some weight. If you are going to attack Exhibit 94, you want to prove in the first place by some substantive proof what particular features of it you criticise and what the nature of the criticism is. Then, having done that, having made some primary proof of that kind to lay the foundation by, it may be proper to take in all these other tabulations and computations as a summary result of the witness' testimony; but I do not quite see how, without laying any foundation by any testimony of the witness, you can go to work and ask him to make a general statement of a schedule here which you have not even introduced in evidence yet.

Mr. BURR: I merely asked him. My object in asking these questions was to meet the objection of Mr. Mathewson by asking him to identify the exhibits and papers which accompanied this report. I will proceed, then, to find out what, if any, items of Exhibit
4360 94 he has eliminated, and then we will get to the reasons for it, and then we will get to the conclusion as the result of such elimination, if he can support it. But I am trying to satisfy the objection made by Mr. Mathewson, and I think we will save time by getting him to identify first his report, after telling what labor he has expended upon it, and then what it purports to contain and what are the exhibits attached to it, and then I will proceed to ask him in regard to what he found as the result of all this examination and what was the conclusion which he arrived at with regard to Exhibit 94 by any elimination of any items in that exhibit, and then state his reasons and explain his reasons, and then offer the report and the figures and exhibits accompanying it.

The MASTER: You will probably get at the same result, but I don't know.

Mr. BURR: If you think it will save time, I will pursue the identification of these papers which accompanying the report and will ask him directly about the report.

The MASTER: It would make it much more intelligible to take up the Exhibit 94 and go through it, item by item, and find what he criticises in it, and then if he has *has* any detailed tabulations which support his conclusions put them in. I do not assume you are going to put in any long narrative report and offer it in evidence with the assumption that it will be received in place of oral testimony.

Mr. BURR: Oh, no.

The MASTER: Your tabulations will be all well enough, but not the other.

Q. Take Exhibit 94, Mr. Hall, appearing at page 2300-A,
4361 and tell the Court exactly what you did with regard to the various items which appear in that exhibit, and as to what items, for instance, you rejected, and your reason therefore, and what items you retained and your reason therefor.

A. Items 1 to 33, I do not take any exceptions to those items. Item 34, Repairs to Apparatus——

Q. What did you do with that?

A. We found certain vouchers which I considered were improperly charged to this account, being more correctly construction. I submitted them to the Advisory Board of Engineers for their opinion——

Mr. MATHEWSON: Just a minute. I don't know — the Board of Engineers are. A board of our engineers?

The WITNESS: No, the City engineers.

Q. In making this examination of the books of the company for the year 1905, were you aided in any way by a Board of Advisory Engineers, and, if so, you may state who constituted that board?

A. Well, Mr. Charles F. Lacombe, the Chief Engineer of the City; Dr. Marks and Mr. H. H. Edgerton.

Q. In case of any doubt in your mind in regard to any of these vouchers, did you submit them to the Board of Advisory Engineers?

A. I did.

Q. Was that item eliminated?

A. $2,133.98 eliminated.

By Mr. MATHEWSON:

Q. Out of the totals of?

A. $169,197.39.

By Mr. BURR:

Q. That made the amount allowed by you $167,063.41?

A. Yes, sir.

Q. What difference did that make in the cost per thousand cubic feet?

4362 A. .02. I may say here that we have assumed a different method of computing gas per thousand feet than that adopted by the Consolidated.

Q. What method did you assume?

A. The cost of gas we divided by the actual manufacture, and the total cost of manufactured and purchased gas by the quantity manufactured and purchased, and the sale and the distributing expenses by the quantity sold to private consumers.

Q. How did that effect this item 34?

A. By about .03 cents.

Q. In other words, so far as that item is concerned on Exhibit 94 as presented by the Consolidated, .62 cents was allowed as the cost per thousand cubic feet of gas?

A. Yes.

Q. The amount claimed was $169,197.39. According to your revision, that amount should be $167,063.41, and the cost per thousand cubic feet of gas instead of 1.62 should be 1.57; is that right?

A. Yes, sir.

Q. Decreasing the amount charged to the cost per thousand cubic feet of gas, .05; is that right?

A. Yes, sir.

Mr. MATHEWSON: I thought .02 of a cent.

The WITNESS: The other .03 of a cent applied to the different mode of calculation.

The MASTER: As I understand, the reduction is made up of two elements: first, the difference in that item 34 and then, second, the difference in the method of calculation, each of which affects the final result?

A. It does; yes, sir.

By Mr. MATHEWSON:

4363 Q. In order to inform myself, may I ask a single question, whether in your computation getting the 1.57 cents you divided by all the gas made by the company, including even the gas which was used by the company in its own business for lighting and so forth?

A. Yes.

Q. And not merely the amount of gas which was made and which was started into the mains?

A. No. I afterwards allowed for the leakage or difference, excess over sales or whatever you call it.

Q. Well, I am simply talking about your divisor here.

A. Yes, I know.

Mr. BURR: It states in the exhibit. The difference in the divisor he calls attention to it at the top of page 1.

By Mr. BURR:

Q. What is the next item?

A. Account 35. Repairs to buildings. The amount entered by the company was $24,900.69, or .24 of a cent per thousand cubic feet. We allowed $24,812.19, rejecting $88.50.

By Mr. MATHEWSON:

Q. What are "we"?

A. Well, I.

By Mr. BURR:

Q. Making the cost per thousand cubic feet .23 of a cent?

A. .23.

By Mr. MATHEWSON:

Q. What was the amount eliminated on that item as going to construction?

A. $88.50.

By Mr. BURR:

Q. And a decrease per thousand cubic feet of .01?

A. Yes, sir.

4364 By Mr. MATHEWSON:

Q. Was any part of that due to the method of calculation?

A. Well, the .01 would really enter into that. The $88.50 would not come to an appreciable fraction of a cent.

By Mr. **Burr**:

Q. What was the next item?

A. Item 43; cost of manufacturing gas purchased under agency agreements, $997,039.89, or 34.82 cents per thousand cubic feet.

Q. That was the way it appears in Exhibit 94 as presented by the company?

A. It does.

Q. What disposition did you make of that item?

A. I rejected $142,580.32, representing——

Q. With that deduction the amount you allowed was——

A. $854,459.57.

Q. Or how much per thousand cubic feet?

A. 29.14 cents.

Q. Which would make a difference and a decrease of——

A. 5.68 cents.

Q. In the cost per thousand cubic feet of gas?

A. Yes.

By the **Master**:

Q. That 5.68 cents also includes such allowance as is to be made by reason of different methods of computation?

A. It does.

Q. Have you segregated or separated in any way the percentage which is due to the eliminated items and the percentage which is due to the difference in the methods of computation? In other words, what are the factors going to make up that 5.68, if you have them?

A. .03 cents, the profit added to the cost of gas purchased. The remainder would apply to that different computation.

4365 By Mr. **Burr**:

Q. What was the next item which you eliminated?

A. Item 47, repairs to gas stoves.

The **Master**: He was about to state what that reduction of $142,580.32 represented, I think. Would you mind asking him that?

Q. What was this amount $142,580.32, which you deducted from the $997,039.89 appearing upon Exhibit 94 as presented by the company?

A. It represents ten per cent. of the manufacturing cost of the gas purchased by the Consolidated, and five per cent. of the amount expended for new construction work on account of the New Amsterdam Company building new works, and the Consolidated give them five per cent. on the construction value.

By Mr. **Mathewson**:

Q. That was five per cent. interest paid, wasn't it?

A. Yes.

By Mr. **Burr**:

Q. That ten per cent. to which you have referred, is that the ten per cent. profit allowed by the agreements in evidence here, the agency agreements?

A. Yes, sir.

Q. That is, the ten per cent. profit allowed by the Consolidated Gas Company to the subsidiary companies under the agency agreements which are in evidence here—you eliminated that ten per cent.?

A. Yes.

Q. And that ten per cent. makes part of this $142,580.32 which you have thrown out or rejected?

A. Yes.

4366 By Mr. Mathewson:

Q. And the balance is five per cent. interest on——

A. On the New Amsterdam construction.

By Mr. Burr:

Q. What was the next item which you eliminated?

A. Item 47, repairs to gas stoves, $55,954.35.

Q. That was the amount presented by the company in the Exhibit 94?

A. It is.

Q. And that amount so presented by the company represents, according to the Exhibit 94 as presented by the company, .42 of a cent as applied to the cost of a thousand cubic feet of gas?

A. Yes.

Q. Now, what disposition did you make of that item?

A. I took the rents received by the company, deducted the depreciation written off by them, and brought the balance into credit as an offset of the charge of $55,000.

Q. The divisor in this case was what?

A. 13,012,384,090.

Q. And what was the result which you obtained as against the result claimed by the company in this exhibit?

A. A credit of $11,413.27.

Q. That made the cost per thousand feet of gas what?

A. There would be a credit of .09 of a cent.

Q. Or a difference of between what the company claims and what you found, of what?

A. .51 of a cent.

By the Master:

Q. That is on the other side of the account, then?

A. Yes, sir.

Q. In respect to that item you would make the cost more than the company does, is that it?

A. No; it reduces the cost.

4367 Q. Then all these others in red ink, are they contrary?

A. They represent credits.

By Mr. Burr:

Q. What was the next item?

A. Account No. 49, repairs to services, $89,033.46.

Q. When you say $89,033.46, that is the amount which appears upon Exhibit 94 as claimed by the company?

A. Yes.

Q. What did they claim as the cost per thousand cubic feet of gas?

A. .67 of a cent.

Q. What did you find?

A. $87,183.15.

Q. In other words, you eliminated from that amount claimed by the company $1,850.31?

A. Yes, sir.

Q. Making any difference in the cost of one thousand cubic feet of gas?

A. No; none.

Q. What did that $1,850.31 represent?

A. That is the operations on account of services increased and extended.

Q. What was the next item?

A. Repairs to buildings, $15,116.68.

Q. What is the number of it?

A. No. 51.

Q. What does that item appear to be on Exhibit 94?

A. Repairs to buildings.

Q. I mean to say what is the amount claimed by the company?

A. $15,116.68, or .11 of a cent.

Q. Cost per thousand cubic feet. What did you do with that item?

A. I rejected $2,845.75 and admitted $12,270.93, or .09 of a cent.

Q. Making the cost per thousand cubic feet——

A. Of .09 of a cent per thousand.

Q. Or a difference between that claimed by the company and what you found of——

A. Of .02 of a cent.

Q. What was the next item which you rejected?

A. Item 53, street lamps $289,259.09, representing 2.18 cents, as claimed by the company.

4368 Q. What did you do with that item?

A. I rejected it.

Q. That made a credit, did it? What was the result of the rejection of that item, as far as the cost of a thousand cubic feet of gas was concerned?

A. A difference of 2.18 cents per thousand.

Q. What was the next item?

A. Item 54, interest on consumers' deposits, $51,391.52, representing .39 of a cent.

Q. As appears on Exhibit 94?

A. Yes, sir.

Q. What did you do with that item?

A. Rejected it.

Q. As a result of the examination of the books?

A. Yes, sir.

Mr. Mathewson: Does he mean that he found by the books that no such amount was paid out?

The **Witness**: No.

Mr. **Mathewson**: Then it is not on account of the examination of the books. It is simply on account of his theories.

Mr. **Burr**: Well, he would not have rejected it without getting the information, whatever it was, from the books, from an examination of the books.

Mr. **Mathewson**: It is not on account of an examination of the books that he rejected it.

The **Witness**: It is on account of my theory.

By Mr. **Burr**:

Q. That was rejected?

A. Yes, sir.

Q. Making the cost per thousand cubic feet of gas at what figure?

A. .39 of a cent.

Q. A decrease?

A. A decrease.

Q. What was the next item?

4369 A. Account 58, Expense, General Office, charged by the company at $339,999.51, or 2.56 cents per thousand.

Q. What did you do with that item?

A. I admitted $308,923.56, or 2.37 cents, and rejected $31,075.95, or a decrease of .19 of a cent.

Q. What was the next item?

A. Account 61, advertising and legal, $105,800.02, or .80 of a cent per thousand cubic feet as charged by the company.

Q. What did you do with that item?

A. I admitted $42,398.37, or .32 of a cent, and I rejected $63,401.65, or .48 of a cent; a decrease.

Q. What other item did you eliminate?

A. Account 62.

Q. What was that?

A. Real estate rents, charged by the company at $42,674.71, or .32 of a cent. I admitted $42,049.71. I rejected $625. It makes no difference in the computation.

Q. What was the next item?

A. The Account 65, insurance, $54,031.83, or .41 of a cent per thousand. I admitted $53,879.39 and rejected $152.42. No difference in the computation.

Q. What was the next item?

A. Account No. 66, taxes, $965,843.88, or 7.27 cents.

Q. What did you do with that item?

A. I admitted $743,151.26, or 5.71 cents per thousand, and I rejected $222,692.62, or 1.56 cents per thousand; decrease.

Q. What was the next item?

A. Account 67, contingent expenses, $1,328,316.37, or 10 cents per thousand. I rejected $1,160,888.53, or 8.71 cents per thousand, decrease; admitting $167,427.84, or 1.29 cents per thousand.

The **Master**: Was there any item out between 62 and 66?

Mr. **Mathewson**: 65. Insurance.

Q. Any other item?

A. Yes. I made an addition to the cost of .73 of a cent 4370 per thousand on account of leakage or excess of make-over sales. I made a further reduction of .04 of a cent on account of discounts not entered by the company in Exhibit 94.

Q. What was the result of the elimination of these items or a modification of them that you have testified to, as to the general result?

A. My deductions make the cost 52½ cents per thousand as compared with 74.81 cents per thousand in Exhibit 94.

By Mr. MATHEWSON:

Q. Per thousand sales?

A. No, per thousand cubic feet.

Q. Per thousand cubic feet what?

A. Per thousand cubic feet of gas manufactured and distributed.

Q. Sales?

A. No, partly arrived at on sales and partly on make.

Mr. MATHEWSON: We do not get anything from consumers except on sales.

The WITNESS: Or a difference of 22.31 cents.

Mr. MATHEWSON: The witness did not exclude fixed charges, I judge. He has not commented on that.

The WITNESS: Item 69, I did exclude that; that $972,423.44; 7.32 cents per thousand.

By Mr. BURR:

Q. Embracing fixed charges, you have now stated all the items which you have modified or eliminated?

A. I have.

Q. And you have also stated the items which you have allowed for leakage and discount?

A. Yes.

Q. And that shows that you have stated, according to your 4371 computation, a cost per thousand cubic feet of gas of 52.50 cents, as against 74.81 cents claimed by the company?

A. Yes, sir.

Q. How much does that make in actual figures?

A. $6,922,738.45, or 52.50 cents per thousand feet; a difference of $3,014,192.08, or 22.31 cents per thousand cubic feet.

Q. In arriving at this result you examined all the various accounts relating to all the various items which you have specified?

A. I did.

Q. And have you attached to your report statements in regard to each of these items as taken from the books of the company?

A. I have.

Q. Now take the accounts as they appear on Exhibit 94, Nos. 1 to 33; what is the total? Items 1 to 33 represent what?

A. Total material and labor employed in manufacture.

Q. And the amount of those 33 items, as appears by Exhibit 94, presented by the company, is what?

A. $3,101,832.24, or 29.77 cents per thousand.

Q. As to those 33 items, what disposition did you make of them?
A. I admitted all those charges as proper.

The MASTER: He stated that already, Mr. Burr, at the outset of his testimony.

Mr. BURR: There is some slight variation I wish him to explain.

Mr. MATHEWSON: One is on the gas made and the other on gas sold. That is all.

Q. Now you examined the items comprising that total, did you?
A. I did.
Q. And you found them correct?
A. Yes, sir.
Q. And did you make an analysis of the manufacturing records which contain in detail the manufacturing averages and results?
A. I did.

4372 Q. And those manufacturing records, where do they appear in connection with your report? Are they annexed to it?

A. Yes, sir; in Exhibit E.

Q. Item 34, repairs to apparatus; where does amount charged under this classification, together with the amount improperly charged, as you claim, to operating expenses, the same being correctly construction items, appear?

Mr. MATHEWSON: Are you asking what constitutes this $2,133.98 which he eliminated?

Mr. BURR: I am speaking about item 34, repairs to apparatus.

Mr. MATHEWSON: He stated he eliminated $2,133.98. It seems to me that all we are interested in is knowing what it consists of.

Mr. BURR: That is all I am going to give you, as they appear, by stations.

Mr. MATHEWSON: Do you intend to give us the totals or the items?

Mr. BURR: Yes, the totals represented by labor and material, total cost and the amount rejected and the amount allowed for each of your five stations.

Mr. MATHEWSON: Why not have the witness testify to it. You ask if it is contained in his report, and I judge you are going to offer his report, but that report has a lot of other arguments, such as Dr. Marks indulged in.

Mr. BURR: You have no reason to make any assertion as to other arguments such as Dr. Marks indulged in, and I move that that be stricken out.

Mr. MATHEWSON: I will admit that that is an assumption.

Mr. BURR: I am going to give you now what you seem desirous of getting; that is, the items going to show the details from which he makes up the conclusions that he has arrived at.

The MASTER: Yes, let him state it.

4373 A. In that account I rejected $2,133.98. The details are found in Exhibit D, Schedule 2. The vouchers were submitted by me——

Q. Never mind that. The account 35, repairs to buildings; where do the details of the amount rejected by you appear?

A. Schedule 3 of Exhibit D.

Q. Item 36, repairs to tools and implements?

A. I admit that account.

Q. But you have incorporated in your report a statement of the cost of manufacture per thousand cubic feet of gas manufactured at each station, so far as that item is concerned?

A. I have.

Q. And it appears upon page 10 of your report, does it?

A. It does.

Q. Also does the same apply to item 37, expenses?

A. Yes.

Q. And item 38, distribution?

A. Yes.

Q. And item 39 is, as you say, a proper charge, is it?

A. Yes.

Q. What have you to say as to account 40, profit and loss adjustment.

A. It is a proper credit.

Q. And you have a table making up item 41, annexed to your report, distributing station expense?

A. Yes.

Q. And the same appears on page 11 of your report?

A. Yes.

Q. Item 42, station cost of gas, you have that account annexed also, have you?

A. Yes.

Q. That account represents the total of the preceding Nos. 1 to 41, does it?

A. Yes.

Q. You have also annexed to your report in connection with item 43, cost of manufacturing gas under agency agreement, copies of the agency contracts or agreements, have you not?

A Yes, sir.

Mr. Burr: They are already in evidence here, I believe.

4374 Q. Have you noted any difference in the agreement between the New Amsterdam Gas Company and the Standard Company?

A. Yes.

Q. If so, state what.

Mr. Mathewson: Just a moment. The contracts are in evidence here. And what difference does it make whether the witness has noted any difference between those contracts or not?

Mr. Burr: As affects this account.

The Master: Let him answer it if it is going to be connected with something affecting this account.

Mr. Mathewson: It refers to the interest, I suppose, on construction.

Mr. Burr: I move that Mr. Mathewson's supposition be stricken out.

Mr. Mathewson: I consent to that.

A. There are two differences in the contracts. The contract with the New Amsterdam is similar to the Standard with the exception that it states that the amount of station repairs is added to the cost, and the Standard contract does not bear that. The New Amserdam contract also provides for interest at five per cent. on the amount expended on construction work of the new station.

Q. Where do the details of the quantities of gas purchased from these subsidiary companies, together with the total cost and the rate per thousand cubic feet of gas, appear?

A. Schedule 4, Exhibit D, annexed to my report.

Q. Account Item 44, total cost at holder——

Mr. **Mathewson**: The next one he objected to any part of was 47 after 43; repairs to gas stoves.

4375 Q. Did you find any variation in the figures given by the company and the figures found by you from an examination of the books with regard to your account 44, total cost at holder?

A. Yes, sir.

Q. What variation?

A. The variation is the repairs to apparatus account, repairs to buildings account and gas purchased under agency agreements.

By Mr. **Mathewson**:

Q. That was merely changing the total by deduction of the items to which you have already testified?

A. Exactly.

By Mr. **Burr**:

Q. You made the total cost at the holder how much?

A. A difference of $144,802.80, or 1.83 cents per thousand.

Q. Well, the total cost?

A. The total cost as given by me $4,452——

Q. Yes, but taking this $144,802.08 out?

A. $4,307,328.46.

By Mr. **Burr**:

Q. As against the $4,452,131.26?

A. Yes.

By Mr. **Mathewson**:

Q. How many cents did you say that was?

A. 1.83.

By Mr. **Burr**:

Q. What did you find the average manufacturing cost of the subsidiary companies to be for 1905?

A. 29.14 cents per thousand.

Q. What did you find the average cost of the Consolidated——

4376 Mr. **Mathewson**: Would you mind letting the witness state when he says 29.14 per thousand what he means, whether on sales, manufacture, gas received, or what, because it makes considerable difference?

Q. What do you mean by 29.14?

A. It is cost per thousand cubic feet of gas purchased from subsidiary companies.

By Mr. **Mathewson**:

Q. The cost to the Consolidated or the cost to the subsidiary companies?

A. The cost to the subsidiary companies before adding the ten per cent.

By Mr. **Burr**:

Q. Now, if the cost to the Consolidated was the same, what saving would the Consolidated have *a*ffected during the year 1905?

A. $492,008.86.

Q. Take item 45, expense, $490,855.36; how is that classified?

A. Under branch office expenses, meter shop expenses and street department expenses.

Q. And have you a statement showing the subsidiary details of these amounts annexed to your report?

A. No, sir. This is all I have.

Q. Well, you have the subsidiary details with regard to these amounts as they appear on page 15 of your report?

A. Yes.

Q. Account 46, distributing; how is that item made up, that item of $281,524.12?

A. Distribution, $258,383.65; distribution, general office pumping drip, $16,579.27; distribution, taking pressure, $6,653.98, and a credit of $92.78 on account of general office distribution.

Q. Have you an analysis of that account?

A. Yes.

Q. Where does that appear?

A. Page 16 of the report.

4377 Q. What does that analysis show?

A. It shows the labor expended setting meters, jobbing work, labor work setting stoves and material used in the ho*d*-er.

Q. At each station?

A. At each station.

Q. That is at Hester Street, 114th Street, Avenue A and 66th Street?

A. Yes, sir.

Q. Some of this work is of a permanent character, is it not?

A. It is.

Q. And might it not be properly chargeable to construction account?

A. It might.

Q. But you have allowed the claim as made by the company for what reason?

A. The distribution written off on similar work in previous years would approximately offset any expenditures in the present year.

Q. You have allowed the distribution to be general office, pumping drips?

A. Yes.

Q. And you have a statement of the details of that on your report at page 17?

A. Yes.

Q. Also distribution, general office (C) and distribution, general office (D)?

A. Yes.

Q. Now the repairs to gas stoves, Item 47; how is that divided?

A. Labor, $30,641.83; material, $25,312.52; total, $55,954.35.

Q. Now, will you state the reasons for your treatment of that item as you have stated in your previous examination some little while ago? Did you eliminate that from Exhibit 94?

A. Yes. The practice of the company and the practice of all gas companies is not to make——

Mr. MATHEWSON: I move to strike out "the practice of all gas companies"——

The WITNESS: Well, the general practice of all gas companies——

Mr. MATHEWSON: I move to strike that out.

4378 Q. Do you know what the general practice is in regard to that?

Mr. MATHEWSON: The witness does not and cannot know.

Mr. BURR: Wait a moment. You do not know everything, Mr. Mathewson; nor do the officers of your company know everything as to the gas business. I have had occasion to remind you of that once or twice before during the hearings in this case.

Q. Do you know what the general practice is in regard to this item, in regard to the treatment of this item, so far as other gas companies are concerned, that have come to your experience?

Mr. MATHEWSON: Objected to.

The MASTER: I will allow him to state, from an accounting standpoint, what the general practice is. He is asked from his experience as an accountant, as I understand it?

Mr. BURR: Yes.

The WITNESS: It is not to make any profit on the merchandise branch of the business, simply to use that as an auxiliary for the furtherance of the sale of gas.

Q. And is it not a fact that they look to the profit from the sale of gas to reimburse them for any loss connected with the sale of fuel appliances?

A. They do.

Q. What was the conclusion you came to as the best way, having this mind, in which to deal with this item of repairs to gas stoves?

A. To take, as an offset, the rentals received from these gas stoves after deduction of the depreciation written off by the company.

Q. In this case, how much did that amount to for 1905?

4379 A. $122,322.60, rentals received; depreciation as written off, $54,954.98; leaving a balance of $67,367.62.

Q. What is the result of that treatment of that item, so far as Exhibit 94 is concerned?

A. To bring a credit into Exhibit 94 of $11,413.27, being the difference between the amount as stated in complainant's Exhibit 94 and the amount brought out by me.

Q. That is the difference between $55,954.35 and $67,367.62?

A. It is.

Q. Now is this credit offset in any way?

A. It is.

Q. Where does that offset appear?

A. Account No. 45, for stoves, $13,324.32; stoves, collecting, $1,904.32; then account No. 46, for stove setting, $25,331.94, on account of labor, excluding material; and also account No. 58, for general office, new business account, $60,575.28, and in office account, $5,590.22; and also the proportion applicable to gas stove business of the general office expenses.

Q. Now, item 48, repairs to mains, what is that item of $126,110.31 for the year 1905 made up of?

A. Labor and material in three shops, Hester Street, 66th Street and 111th Street; total labor, $88,887.58; total material, $37,222.73.

Q. A total of how much?

A. $126,110.31.

Q. Did you find any statement as to the mileage in the books of the company?

A. No, that was supplied by the officials at my request.

Q. And what was the information which they gave you upon that subject?

A. The mains laid December 31st, 1904, 815.974 miles; laid during the year 1905, 11.327 miles, total 827.301. Taken up during 1905, 2.873; abandoned during 1905, 19.834, mains December 31st, 1905, 804.594.

Q. That gave an average mileage of 810.284 during 1905?

A. It did.

Q. What was the average cost of maintenance?

A. $155.63 per mile of main.

4380 Q. In your examination did you find certain charges in respect to relaying pavements, and if so, state what you did with regard to those items?

Mr. Mathewson: Mr. Burr, you are examining the witness with reference to items that he says he made no objections to, and which consequently stand. Do you think it is worth while to go into those details?

Mr. Burr: There are some items which we have grave doubt about, and yet to be on the safe side, beyond all peradventure of doubt, we have allowed them, and I am going to ask him to state them and to state his reasons.

Q. Did you find such items in respect to charges for relaying pavements?

A. I did.

Q. Did they contain specific information to satisfy you as to what accounts they should be charged against?

A. They did not.

Q. And in consequence did you take any action on the matter?

A. Submitted the matter to the Board of Advisory Engineers.

Q. And what conclusion did they come to?

Mr. Mathewson: I object to that.

The Master: Is not that stretching it a little far?

Mr. Burr: To save time, it is a continuous story, and we will have the engineers, and it may be stricken out if I do not connect it with the action that they concluded to take.

The Master: If you want what they concluded about it, you had better have them here to testify. It does not add anything to his testimony now that I can see. He may state what he did and how he arrived at it.

Q. In consequence of that consultation what did you do?

4381 A. I admitted them as operating charges.

Q. How does the street main capital account appear in the books?

A. On December 31, $7,433,800.57. Added during 1905, $83,548.08, total $7,517,348.65. Depreciation written off $90,561.54. At December 31st, 1905, $7,426,787.11.

Mr. Mathewson: That is, as they stand on the books on December 31.

The Witness: Yes.

Q. Item 49, repairs to services, how is that account distributed in the books?

A. Over the stations at Hester Street, 66th Street and 111th Street, divided into labor, $46,403.37, material $42,630.09, total $89,033.46.

Q. What is the statement of the number of services appearing on the books?

A. December 31, 1904, 88,685; installed during 1905, 2,745; total 91,340. Cut-off during 1905, 4,921 at December 31, 1905, 86,509.

Q. What does the capital invested appear to be?

A. On December 31, 1904, $1,221,831.83. Added during the year, $37,797.54, total $1,259,629.37; depreciation during year $37,401.00; at December 31, 1905, $1,222,228.37.

Q. What was that equal to per service?

A. $14.13.

Q. Did you make any special examination for the purpose of satisfying yourselves that the charges to both operating and construction account were proper?

A. I did.

Q. What did you do?

A. I examined all the pay-roll tickets.

Q. What did you find?

A. That a considerable number of extensions and increases to services had been charged to operating expense.

Q. Instead of what?

A. Capital.

4382 Q. Or construction?

A. Or construction.

Q. The labor on this work is detailed where?
A. Page 20 of the report.
Q. In Schedule 5, is it not?
A. In Schedule 5.
Q. Annexed to your report?
A. Yes.
Q. And briefly made up of what?
A. The Hester Street branch, $609.14; 66th Street, $107.71; 111th Street, $1,133.46, total, $1,850.31.

Mr. Mathewson: Those are the details of the rejected items to which you have heretofore testified?

The Witness: Yes.

Q. The material used was not recorded on these payroll tickets, was it?
A. Not the money value of the material.
Q. And were you able therefore to determine what additional amount should be added on this account to the cost of labor?
A. No.
Q. And in consequence the operating charge fails to be adjusted, does it not, is adjusted in what manner?
A. By the deduction of $1,850.31.
Q. Or equal to what, per average service?
A. The average charge to operating, 99.5 cents per service.
Q. For the year 1905?
A. Yes.
Q. Item 50, repairs to meters, what are the two items which go to make up that charge?
A. Labor and material.
Q. What were they?
A. Labor $126,069.90; material $46,855.62, total $172,925.52.
Q. And have you got the totals of meters in use and on hand during that period, can you state what number there were of ordinary meters?
A. In detail?
Q. Yes.

A. The ordinary meters in use December 31st, 1904, were
4383 286,566. December 31st, 1905, 296,981. Set locked in
1904, 27,104, in 1905, 27,746. In stock 1904, 1,968, 1905,
2,310. At repair shop 1904, 17,037, 1905, 19740. At factories
1904, 99; 1905, 609. Total 1904, 332,774; 1905, 347,386. Prepayment meters——

The Master: Mr. Burr, I do not see the force of putting all these details on the record here, as part of the witness' testimony, if you are going to offer these schedules and tabulations annexed to this report.

Mr. Burr: I think that is all I will ask him about that. All these items are detailed in the schedule as he has stated, annexed to his report.

Q. In arriving at the cost per thousand cubic feet for manufacturing and distributing the gas did you take into account the amount of the leakage?
A. Yes.

Q. Including the gas used by the company? By the way, what did you find to be the amount of gas used by the company?

A. 64,077,056 feet.

Q. What did you find the amount of leakage to be?

A. Inclusive of that amount, 300,990,555 cubic feet.

Q. Did you include that as a distribution charge at the average cost of manufacture?

A. Yes.

Q. And your method of entering the leakage differs from that adopted by the company, does it not?

A. It does.

Q. In what respect?

A. The company dealt with the quantity distributed and we deal with the quantity manufactured.

Q. They use as their divisor the quantity manufactured less the leakage?

A. Yes.

Q. While you adopt the quantity manufactured, is that right?

A. Yes.

4384 Q. And that adjustment amounts to how much per thousand cubic feet?

A. .73 cents.

Q. Now, what was your practice in this examination in cases where there was any doubt existing regarding the correctness of the company's allegation of its charges?

A. In all cases, we gave the company the benefit.

Q. Can you state a few of the items in which you pursued that course?

A. Yes. General office salaries and expenses, properly should be proportioned over the general work of the office in connection with sales of gas to consumers to construction work, and investments in other companies. It was not so treated.

Q. In other words that $99,807.42 you have taken and you have not charged any proportion of it to construction work or to revenue received from investments in other securities?

A. No portion.

Q. Has anything been charged to the revenue from street lighting contracts on account of general office expenses including distribution?

A. Nothing.

Q. The total of these expenses amounts to what?

A. Approximately $1,375,000.

Q. What is the proportion of gas sold for street lighting purposes?

A. Approximately 2 per cent. of the total.

Q. Is it not a fact that a number of doubtful charges in the repair account were conceded to the company?

A. Yes.

Q. All the expenditures in connection with the stove department have been admitted?

A. Yes.

Q. And what is your criticism, if any, with regard to that account as it appears here on the books, why in your opinion was it doubtful, if it was so doubtful in your mind?

A. Which account?

Q. The expenditures in connection with the stove department.

4385 Mr. MATHEWSON: He has testified to that, stove repairs and how he offset the rents of stoves.

Q. You have allowed the total amount of bad and doubtful debts, haven't you?

A. Yes.

Q. Is that a doubtful account, in your opinion?

A. It is.

Q. Why?

A. Bad and doubtful debts are not a proper charge against the distribution of gas, especially when the company has a provision by which it can have a deposit.

Q. Do you mean especially where there is a provision of law which permits them to take a deposit from every consumer?

A. Yes.

Q. And do you consider the price of 52.50 cents as determined by you a liberal allowance under these circumstances?

Mr. MATHEWSON: I do not think that that sort of generalization is allowable.

Mr. BURR: He has stated what he did and what allowances he made with regard to doubtful accounts.

Mr. MATHEWSON: Whether or not it is liberal I think depends upon other circumstances.

The MASTER: I do not think that is of value, Mr. Burr.

Mr. BURR: In his experience as an accountant, and having in mind the various accounts he has adjusted, and what action he took in regard to these doubtful accounts, I think I am entitled to get at what was in his mind when he arrived at that conclusion, whether or not it was, in view of all those circumstances, a liberal allowance.

The MASTER: What deduction did he make?

4386 Mr. BURR: These deductions he has stated as having been doubtful.

The MASTER: Item 55, is it not?

Mr. MATHEWSON: Bad and doubtful debts, no, he allows that.

Mr. BURR: No, he says they have allowed that but he is strongly of the opinion it should not be allowed. Then with regard to these other items of repairs in the stove department, the manner in which they kept that account and the other items which he claims should properly have been charged to the construction account instead of against the repairs, they allowed——

The MASTER: I so understand, but what is the question about, what in his mind would be a liberal proportion?

Mr. BURR: No, I ask whether the amount he had allowed as the proper charge of gas under these circumstances is or is not a liberal allowance.

Mr. MATHEWSON: 52.50 cents, and he has testified how he arrived at it.

The MASTER: I will exclude it.
Mr. BURR: I withdraw it.

Q. Now, with regard to Exhibit 80, you have made up the details also of the sundry creditors, $3,357,037.95, have you not, Mr. Hall?
A. I have.
Q. And that appears as annexed to your report?
A. It does.

Mr. BURR: There is just that item on Exhibit 80, sundry creditors. He has made up a detailed statement of what the total embraces.

Q. Now, Mr. Hall, did you examine the real estate account? I think you have already stated that you made an examination
4387 of the real estate account. What did you do, how did you examine this account, what books did you refer to, or what were given you?
A. All the books of the companies merged as the Consolidated Company, November 11th, 1884, with the exception of those belonging to the Knickerbocker Gas Light Company and the Metropolitan Gas Light Company.
Q. Those you did not have?
A. No.
Q. You could not find the books, or the officers informed you, did they not, that the books were lost or mislaid?
A. Yes.
Q. And in the absence of these books the scope of your investigation was limited, was it not, necessarily?
A. It was.
Q. And did you therefore consult any other report with regard to this real estate?
A. Consulted the report made by Mr. J. Yalden, an accountant in New York City, made in 1885.
Q. And which is in evidence in this case?
A. It is.
Q. And what have you to say with regard to Yalden's account as the same affects the Metropolitan Company?
A. I have simply adopted Mr. Yalden's figures for the Metropolitan Company.
Q. What do you purport to show by this report?
A. The original cost with the buildings and improvements added of all the real estate acquired by the merged companies prior to November 11th, 1884, with the appreciation written up, also prior to that date and the appreciation written up on that date, the date of the consolidation; and I further show the additions and improvements made by the Consolidated Gas Company and the profit over the cost to them of the properties they sold.
Q. And what do you purport to show by the various Exhibits A to F inclusive, attached to your report?
4388 A. A to E inclusive, the real estate taken over by the Consolidated Gas Company by the various merged companies;

Exhibit F, the real estate acquired by the Consolidated Gas Company up to December 31st, 1905.

Q. Since November 11th, 1884?

A. Since November 11th, 1884.

Q. What did you find the original cost to be including additions and improvements, from such examination?

A. Up to December 31st, 1905?

Q. Yes.

A. Up to December 31st, 1905, $4,118,267.38.

Q. What did you find the original cost including building- and improvements to be, November 11th, 1884?

A. $3,377,971.10.

Q. So the original cost of additions and improvements from November 11th, 1884, to December 31st, 1905, appears to be $740,296.28?

A. Yes.

Q. That makes up your total of $4,118,267.38?

A. It does.

Q. What appears to be from such examination the appreciation in the real estate account of the merged companies prior to November 11th, 1884?

A. $1,584,963.37.

Q. How is that divided among the constituent companies?

A. A credit of Manhattan Gas Light Company for depreciation, $21,706; a charge of New York Gas Light Company, $866,696.23; Metropolitan, $739,973.14.

Q. What did you find the amount of the appreciation on the transfer to the Consolidated on November 11th, 1884, to be?

A. $5,369,065.53.

Q. So, adding to the $3,377,971.10, the original cost of buildings and improvements, the appreciation less depreciation prior to November 11th, 1884, of $1,584,963.37, and the appreciation written up on transfer to Consolidated Company on November 11th, 1884, of $5,369,065.53, what do you find the book value to be of
4389 the real estate taken over at that time, November 11th, 1884?

A. $10,332,000.

Q. Now, adding to that $10,332,000 the additions and improvements to December 31st, 1905, less cost to the Consolidated Gas Company of property sold, $740,296.28, what do you make the total?

A. $11,072,296.28.

Q. Is there any item to be deducted from this?

A. Yes, profit over the cost to the Consolidated Companies of the properties sold $142,378.

Q. You have not deducted, I believe, any of the amounts awarded to the Consolidated Gas Company by the city for property taken by it in condemnation proceedings?

A. No.

Mr. Mathewson: Which has not been paid over you mean?

Mr. Burr: I think I remember of your speaking of that before.

Mr. Mathewson: Well, he has taken into account the moneys which have — awarded in condemnation proceedings if they have been received by the company?

The WITNESS: Certainly.

Mr. BURR: But it claimed that you have not received this money.

Mr. MATHEWSON: No, no. You asked him whether he had deducted any amount received in condemnation proceedings, and he said no. I think there is a distinction. He has deducted the money received in condemnation proceedings where the money has been paid over.

The WITNESS: Where anything has been paid over.

4390 Mr. MATHEWSON: But he has not deducted any amount awarded in condemnation proceedings where the company has not received it?

Mr. BURR: I guess there is no doubt of it.

Q. Whatever the company has received by the sale of real estate or the acquisition by anybody of its real estate since 1884, does it appear in this account?

A. To the end of 1905.

Q. Where does that appear? Where does the list of property transferred by the Consolidated Gas Company to any person appear?

A. Page 6.

Mr. BURR: I offer this report in evidence, all excepting Exhibit A, which is attached to the report, regarding Exhibit 94; such Exhibit A being minutes of the meetings of the several engineers and which I do not claim forms part of this report.

Mr. MATHEWSON: I object to the report as evidence. The witness has testified to certain deductions which he has made and to the details of them so far as he has been asked, and he has stated that certain schedules here showed the details. If there is any offer it seems to me it should be of those schedules. But this has an immense amount of details with reference to which there is no dispute at all. It has general observations and statements here and arguments that the witness has deduced. I cannot cross-examine the witness on that book, I confess, Mr. Master, without a considerable interim, if it is accepted. Has the Master looked at this?

The MASTER: Yes, I have glanced it over. Undoubtedly there is a large portion of this or some portion of it that is inadmissible. All these statements in the report itself as to conclusions arrived 4391 at by the Advisory Board, I understand Mr. Burr does not claim are evidence.

Mr. BURR: That I will make a matter of subsequent examination of these engineers.

The MASTER: The exhibit which constitutes the minutes of that Board are not offered, but in the body of the report itself are several references to conclusions arrived at by the Board which are equally objectionable. And I do not suppose either that any data assumed by the witness from the report of Mr. Yalden some years ago are evidence. But on the whole, Mr. Mathewson, I think, for the purpose of convenience, this report had better be received, and the schedules annexed to it also, as a summary statement of the results of the witness' examination of the books. Of course in so far as the report contains references to the Advisory Board, that will be deemed to be excluded just the same as the exhibits are which contain their minutes.

Mr. Burr: Yes, I will depend not upon his allusions to those reports or to the action of the engineers in such reports, but upon the testimony of these engineers themselves whom I will call to testify.

Mr. Mathewson: It seems to me there is something else to be considered here which has not been suggested. You will see by turning to page 3 of the report, how narrow is the scope of the items objected to. Now, is it worth while to put in this vast amount of detail which has no relation to those items at all upon items as to which there is no dispute, and is it fair to us to virtually spread upon the records of the Court the details of our business which we have thrown open to him and which the witness has verified and
4392 the items of which he says are all right, like the costs of meters, and everything of that sort?

The Master: I have assumed, without looking at this report carefully, that these schedules here have reference simply to the items as to which the witness has testified he made a different calculation.

Mr. Mathewson: Not at all.

Mr. Burr: Oh, yes.

The Master: And I noticed, in one or two cases, that he had, for the purpose of convenience, reproduced exhibits already in evidence, as for example, Exhibit 94, and the agency agreement; they are also in evidence, are they not?

Mr. Burr: Yes.

The Master: But I assumed that was merely for the purpose of convenience, and did not make any particular difference. If, however, it is the fact that there are included in these schedules a great many items that have no bearing on these specified differences set forth on page 3 of the report, that is a different question. I will have to look at it and see.

Mr. Burr: There is no such thing as that. The object of putting in this information is so that the Court might have before it all the figures which justified the conclusions which they have arrived at in their report, and the comments which they make with regard to the keeping of these various accounts and to justify their statements that in many respects the accounts which they have allowed are, to say the least, very doubtful.

Mr. Mathewson: Take item 52, tools and implements.
4393 No objection is made to that. Here it appears in the schedule showing it in detail.

Mr. Burr: It is impossible in a work of this kind to say "leave out this and leave out that." They were called upon to examine the books here and they have made a comprehensive and intelligent report and have given their figures to justify the conclusions at which they have arrived. I cannot castrate this report and take out of it all that is in my opinion immaterial to it and at the same time expect the Court to value it as a continuous and intelligent report.

This is done for the benefit of the Court and for the information of the Court.

Mr. Mathewson: Item 45, page 14, there is no objection to item 45, and we have at page 14 and page 15 a page or two showing details of wages paid and all that which if our friends and our employees get hold of it in their unions and figure up, we will have a strike on our hands among other things.

Mr. Burr: They cannot figure up the totals there. We are not giving the rates.

Mr. Mathewson: And on page 15 you will see, respecting which no objection is made——

Mr. Burr: We have endeavored to give you a fair report, giving you credit where credit is due and criticising where criticism is due. I think it will so appeal to the Court.

Mr. Mathewson: But that is not the point. There are many items in here as to which there is no objection.

Mr. Burr: How can it hurt you, then?

Mr. Mathewson: Yes, it can hurt us. We do not want to virtually spread the transcript of our books upon the public record, nor does any other company, especially so in regard to an item that no objection is made to. It is idle.

4394 The Master: There is force in that. It will be necessary to go through this Exhibit and weed it out.

Mr. Burr: There is not anything there which is not necessary to the report itself and to the full understanding of it.

The Master: I assumed in what I said before in regard to these schedules that they were all like this item No. 49 where the witness has set out here in great detail as Exhibit D the details or the particulars of the payroll tickets, showing the way he made up the modification of the company's figures in Exhibit No. 94. I do not know that they are of any great value to me; but as a voucher for the correctness of the witness' conclusions, they are properly part of his testimony.

Mr. Burr: Yes.

The Master: And I assumed that all these exhibits or schedules were of the same kind. Now if it is a fact that there is a lot of material here that has reference to items that this expert witness has not seen fit to make any change in, I do not think they ought to be received. If they are not of enough importance to make a change in, why speak of them at all?

Mr. Burr: I think it is due to him to permit him to say what accounts he deemed doubtful.

The Master: He has said so and stated here.

Mr. Burr: And the reasons why he allowed them. It cannot do any harm to the company. They seem to have a particular aversion to having anything spread upon this record in regard to their books, and we know the fight we had to get this examination, and now we have got it and now we are giving them all the information our accountants obtained from this examination. And you find 4395 upon Mr. Mathewson's cross-examination there will not be anything superfluous. I presume that is the reason this gentleman, who is a competent and careful accountant, has come fully buttressed with schedules attached to his report to justify his findings.

The **Master**: I will exclude all the schedules that do not have reference to the disputed items. If he wants to have the material for use on cross-examination, well and good, but I will exclude it as evidence. It will be necessary to go through this and weed out exactly what is admitted and what is not. You did not offer the minutes of the Advisory Board?

Mr. **Burr**: No.

The **Master**: I will treat those in the same way; these schedules that do not have reference to the disputed items, if such there be, ought to go out.

Mr. **Burr**: Then you strike out all the schedules with regard to which this witness has commented and claimed that they were doubtful?

The **Master**: Well, I don't know as to that; some of them he has changed or pointed out discrepancies in, some accounts that he claims were doubtful, I think.

Mr. **Burr**: I do not see, without butchering this report, how you are going to do that or rule out any portion of it.

The **Master**: You will have to butcher the report——

Mr. **Burr**: Particularly when it is conceded it cannot do them any harm.

The **Master**: If admitted at all, it is only for convenience. You cannot expect that a private report of a firm of accountants addressed to the attorneys who employed them is evidence against the opposite party. 4396

Mr. **Burr**: Not unless it can be proved and justified to be correct, that is what we are here for.

The **Master**: You can call the witness and have him justify the figures and prove them correct, but the private report to his employer cannot be made evidence against the other side unless it is competent.

Mr. **Burr**: Not unless it is competent as your Honor has well said, but I claim that all he has attached to his report is competent, because they justify the conclusions at which he has arrived, and I offer it, and if you consider there is anything that is objectionable and should not be put in, I will take an exception; but I understand the balance is received as an exhibit.

The **Master**: If he simply picks up an item and says, "I have allowed this, but at the same time I have grave doubts about it," I do not see that it is material and relevant, if the other side objects to it, to receive here a vast quantity of tabulation showing the reason for the witness' doubt on the subject.

Mr. **Mathewson**: There are large numbers of these respecting which he has made no doubt. You see he takes the items, whether he is in doubt or not and puts in tabulations respecting them and he states what he finds as to the Massachusetts Gas and Electric Light Commissioners' doings and things like that in this report.

The **Master**: Of course I may think differently about this after

I have gone through this carefully myself, but simply glancing at it here, that is my disposition about it.

4397 Mr. **Kirby**: There is another point in regard to the admission to the entire report and that is this: That while there may be certain items in Exhibit 94 which the accountants have found to be correct so far as the additions of the accounts going to make it up are concerned, that nevertheless, the schedules, the detailed schedules which he has given, give us the opportunity, and give the engineers the opportunity to make comparison with testimony which is already upon the record, and with testimony which may hereafter be placed upon the record as to whether or not such charges for material, or labor, or for anything else, are correct and proper; and for that reason it is certainly relevant to this case.

Mr. **Mathewson**: We cannot assume that you intend to rebut the syndicate conclusions of this witness and of Messrs. Marks and Lacombe and Edgerton, the so-called Board of Engineers who have collaborated in getting this up, as I judge. I do not think it is fair to assume that, Mr. Kirby.

Mr. **Kirby**: That has nothing whatever to do with the position which I am taking.

Mr. **Burr**: I think I have made myself clear as to the reasons.

The **Master**: I understand the reason so far as the suggestion of Mr. Kirby is concerned, is one of convenience merely, it is not one of evidential force. No doubt it would be very convenient to have all this in its present form, but it is a question of whether, against objection, it is evidence in the suit.

Mr. **Kirby**: No, it is not merely a matter of convenience. It is a question of this, that anything and everything which goes to 4398 make up any item in any exhibit should be in evidence here, the same as the exhibit itself, whether those items are held to be correct or incorrect.

Mr. **Burr**: The reason I press my offer of this report in evidence is because I contend there is nothing attached to that report which is not necessary to a full understanding and appreciation of it and which is not properly a part of it.

The **Master**: You can point out which particular ones of these schedules you specially object to, Mr. Mathewson: and then I will pass upon them.

Mr. **Mathewson**: Then I will have to have an opportunity to go through them.

The **Master**: Yes.

Mr. **Burr**: It is received in evidence subject to the objection of Mr. Mathewson to certain schedules attached to it; is that the way it stands?

Mr. **Mathewson**: Why that? Why not let me look over them in the first instance?

The **Master**: Either mark it for identification or else do it that way. I am going to receive the substance of it, I mean the detailed schedules that support the witness' testimony as to his rejected or modified items. If there is anything else here that is not material, I will exclude it and you can have it separate. As far as the report itself goes, in my glancing over it I do not see anything here except some few references to this Advisory Board and their conclusions but what might properly be received, in my judgment, as a summary of the witness' examination of the books.

Mr. **Mathewson**: Is it competent for the witness in this 4399 report to testify what the Massachusetts Electric Light Companies allow per meter for repairs and things of that sort?

The **Master**: That is what I had reference to. I saw that. That is clearly incompetent, of course

Mr. **Burr**: That is the reason for the action of the advisory engineers with regard to a certain item, and they will explain the reason for making that comparison. This report is to be taken in connection with the promised testimony of the advisory engineers with regard to items which are therein referred to as having been passed upon by that Board, and of course such statements are received subject to being stricken out if I do not call those witnesses.

The **Master**: It is to be regretted that this was not prepared, all this material here, in a different shape so it could be properly offered in the usual way.

Mr. **Burr**: We regard as part of this offer the testimony of the engineers. Their testimony and this report makes a complete whole as to what we undertook to do, that is, to examine these books for the year 1905, so far as those books should be examined in connection with Exhibit 94.

Mr. **Mathewson**: Professor Bemis, in his testimony, testified as to certain computations and then presented the schedule which was attached to that at the time, and not a mass of testimony with it. In other words, he testified and then merely submitted the table to show the details. It seems to me that is—where is Exhibit E, may I ask?

The **Witness**: I do not think you will find it there, that is incomplete.

4400 Mr. **Burr**: Here, I will let you look at this copy.

Mr. **Mathewson**: Here is Exhibit E, items 1 to 33. The Committee says and the witness testified at the outset that he found those vouchers correct, and the company's figures correct. Items 1 to 33, about half the items. Now, schedules are presented here known as schedule E No. 1, schedule E No. 2, and Nos. 3, 4 and 5, and the Master will see—I have them here, I do not know that they are in your copy—but they appear later, all these schedules in reference to those items going into detail, almost without limit I was going to say, all those pages on that subject, spreading out in great detail these things which are found to be correct and respecting which there is no question on anybody's part. I ask, is it fair to us to spread all that detail out in addition to its being unnecessary and immaterial? The witness accepts the items.

Mr. **Burr**: All those statements were necessary to enable the engineers to pass intelligently upon the propositions that were presented to them by the accountants.

The **Master**: Then it will come in as part of their testimony.

Mr. **Burr**: Then there cannot be any harm done.

Mr. **Mathewson**: But they have admitted them.

Mr. **Burr**: They needed those for comparison and could not go blindfolded as you expect possibly. There is nothing here which is superfluous; it is a plain straightforward account and the figures are presented to justify the conclusions which have been 4401 arrived at. We have not skimped anything but have given you the benefit of the full examination which we have made. And I do not see that the objection that this information should not go on this record is a tenable one at all. It cannot do them any harm according to their own admission, and it is necessary for us for the purposes of having this account fully understood. This is not a sacred organization or an elecmoysnary institution, and the results should be known.

Mr. **Mathewson**: But our company has the same right as any other company or corporation. We do not claim any sacredness, but we claim we are as good as other people. I would like to have the Master look at Schedule E.

The **Master**: I saw them, but of course if excluded they have got to be printed, Mr. Mathewson. What I am considering is the best way of getting at this. There is no question to my mind about the propriety of excluding them. There are several matters in this report and the only question is whether it might not be better for the purposes of convenience to take the report in the form it is offered rather than confine the actual exhibit, as marked, to the schedules referred to by the witness in his testimony this morning. If we do that, it will be necesary to cut this report up and give each one of these schedules a separate number without reference to the report.

Mr. **Mathewson**: Well, I think if I may be permitted to say so, that it is a shame, when we give the accountants the opportunity as they have had there and when they go through these items and confirm our manufacturing records, the first thirty-three items, half of all of them, as an expenditure of $4,000,000, that for pur- 4402 poses of curiosity of somebody it should be insisted upon spreading upon the record here, which will be a public record and accessible to everybody in the world, the details of that business which has been found to be correct and to which no objection has been made. I say it is not right, and it is not treating us fairly. It is something that any corporation, no matter what it is engaged in, would object to most strenuously. And when we say we have no objections, of course, we could not object where items are objected, to the details going in, I think we have gone as far as we ought to go. I do not think it is right. I do not think it is right for the other side to insist upon presenting those details in this public fashion. We might just as well file our books in court. We are entitled to the same fair treatment as any other corporation engaged in an industrial business, certainly as to those items where no question is raised. I am sure that our officers and our directors will feel most keenly the spreading on the record here of details which have no earthly relation to items respecting which there is any objection at all.

Mr. **Burr**: That is your view of it, that they have no relation. I say they are very important and pertinent to this report. Of course you view with alarm and consider it a shame that there should be any information obtained from your books at all, and you have objected to the spreading on this record of your coke and oil and coal contracts, and we have accommodated you to some extent, and now you do not want anything to appear on the record regarding this examination which we had to fight tooth and nail for.

4403 Mr. Mathewson: Nonsense, we gave you the examination. We have given you everything and have allowed thirty or forty men there for five or six weeks appropriating anything and everything they wanted to in the office. Now, you want to spread on the record the details of items respecting which there is no dispute at all. I say it is not right, it is not fair, and it is not decent treatment.

Mr. Burr: I need only say in that connection that this is not a private firm or corporation, it is a public utility corporation in which the City of New York has a large interest.

Mr. Mathewson: And any item which is questioned, you are putting the details in here without any objection on our part.

The Master: What else is there besides this Exhibit E to which that same thing is applicable.

Mr. Mathewson: I do not know, Mr. Master. I could not tell without looking through this. It is perfectly obvious it contains an immense amount that the witness has not testified respecting, but just what it is I cannot tell without looking through it. Now here is something——

The Master: It seems a pity to waste time considering this matter if there is anything else that can be done. If you can go on and cross-examine, I will look at this.

Mr. Mathewson: I can go on and cross-examine all right. But it is now after 1 o'clock.

The Master: I will look over this report. I find in it more than I had supposed that is open to objection. We will take a recess now.

Recess till 2:30 P. M.

4404 After Recess.

The Master: After looking over this report, I have decided that I shall, for the purposes of conveniences, admit it in its present form, exclusive of the schedule Exhibit A which Mr. Burr excluded from his offer, and excluding, also, the various tabulations Exhibit E. In excluding Exhibit E I do so without prejudice to it being offered and received later in the course of the examination of any other witnesses to whose testimony it may be pertinent and material.

In receiving the report in its present form it is to be understood that there should be deemed excluded therefrom, so far as purposes of evidence go, all statements of action taken by the so-called Board of Advisory Engineers. It is proper to have it stated, of course, that the witness made certain disposition of certain items in accordance with instructions received by him from the Advisory Board of Engineers and in so far as concerns such statements the report is proper, but there should be excluded from it all abridgements or extracts from proceedings of that Board. And also, in making the foregoing disposition of the matter, it would necessarily exclude from the report the statement of the witness in the report as to his reason for annexing the Schedule E, which has been excluded. Now, with these limitations the report is received as being a summary of the results of the work that the expert accountant has been called to testify to, as the result of his examination of the books.

Mr. **Burr**: As the Master said, I have not offered the minutes of the Board of Advisory Engineers. Regarding the exclu- 4405 sion of any other part of this report, whether the same be in the body of the report or in the schedules annexed thereto, you will give me the benefit of an exception.

The **Master**: In giving it to the Stenographer for printing you eliminate Exhibit A and you also eliminate the other exhibits, Schedule E, and those can be offered later in connection with the testimony of other witnesses, if you desire.

Mr. **Burr**: But I understood that under the rule even if the whole thing is excluded it will be printed.

The **Master**: If you wish to do it that way.

Mr. **Burr**: So as to make it a complete whole I will have it printed except that Exhibit A, and ask the Stenographer merely to note that Exhibit A is the record of the minutes of the Board of Advisory Engineers and is not offered in evidence, but with regard to all other parts, I shall ask to have it printed and then I shall again renew my offer later in this hearing, after I think I have supplied what in your Honor's mind may be lacking now with regard to those other schedules.

Mr. **Mathewson**: I except.

Mr. **Burr**: And the schedules which you have excluded by your ruling now I ask to have marked for identification so that they may have a specific number for that purpose.

Mr. **Mathewson**: Is it necessary so long as the whole thing is to be printed to have them marked for identification? You can offer them subsequently.

Mr. **Burr**: I think that suggestion is a good one. If I overcome the objection the Master has now they will be received.

Mr. **Mathewson**: I except to the admission of this report 4406 except so far as it relates to the schedules and tabulations respecting the items which the witness has excluded in his computations from the operating cost of gas. Will the Master permit that exception?

The **Master**: I understood I had already excluded those Schedules E, which were the ones to which your objection was chiefly directed.

Mr. **Mathewson**: I think there were some shorter schedules in the body of the report, or tabulations perhaps rather than schedules, and my objection relates to those as well as to the schedules to which you particularly refer.

The **Master**: It is hardly worth while to chop the report up in those small particulars, as I am receiving it mainly for the purposes of convenience anyway. You can take an exception to it.

Mr. MATHEWSON: I understand that so far as probative force is concerned I shall waive no rights upon preceding examining upon points which this witness has not been examined upon.

The MASTER: No.

Mr. KIRBY: Exception to the ruling excluding such parts of the report as were offered.

Received in evidence and marked City's Exhibit 87.

JAMES HALL resumes the stand and further testifies.

Direct-examination continued by Mr. BURR:

Q. In that 52.50 cents was there any allowance made for depreciation?

A. Yes.

Q. How much?

A. $222,382.82, equal to 1.71 cents per thousand feet.

4407 Q. Well, deducting that allowance for depreciation, what do you make the cost per thousand cubic feet?

A. 50.79 cents.

Q. Was there any allowance for renewals?

(Question withdrawn.)

Q. Was that $1.71 cents actually spent?

A. No.

Q. What did you find with regard to that from the books of the company?

A. Depreciation.

Q. In which account did you find that?

A. Depreciation account.

Q. Calling your particular attention to Item 67, Contingent expenses, $1,328,316.37, or ten cents per thousand cubic feet of gas sold, how was that entered in the books of the company?

A. Charged to contingent expenses, credited to reserve account, called Renewal and Contingency Account.

Q. Was that a natural expenditure or was it a bookkeeping entry?

A. Bookkeeping entry.

Q. Was the other a natural expenditure or was it a bookkeeping entry?

A. A bookkeeping entry.

Q. How about 1903 and 1904, bookkeeping or actual?

A. So far as I could observe from trial balances, bookkeeping entries.

Q. At the close of 1905 how much was debited to this reserve account?

A. $282,219.67.

Q. Did that represent any actual expenditure?

A. No.

Q. What was it?

A. Depreciation on certain plant accounts detailed here; plants, services, mains, meters, etc.

Q. Do you know whether that was entered in the form in which you found it as the result of any official action on the part of the company?

A. Yes; a resolution of the directors and officers of the company.

Q. The resolution appears entered upon the books of the company?

A. Yes.

Q. In connection with that account?

A. Yes.

4408 Q. Have you made that resolution a part of your report as it appears upon page 34?

A. I have.

Q. And this amount of $282,219.67 which was the subject of that resolution as you have testified, is the amount which appears in Exhibit L on page 418 of exhibits under the head of "Renewals, Total, 1905"?

A. Yes.

Q. And that amount did not represent an actual expenditure?

A. It did not.

Q. What did you do, Mr. Hall, a little more particularly, with regard to leakage?

A. I took the leakage as taken from the company's books as a charge against the distribution of gas.

Q. And as to the item of taxes, what disposition in detail did you make of that?

A. On page 33——

Q. In your report you have shown on page 33 the disposition which you made with regard to the item in detail?

A. Yes, sir.

Q. Is there anything that you desire to add to what you have written here in this report, with regard to that item, or does that fully explain the disposition which you made of that item of taxes, and the reasons therefor?

A. That fully explains.

Q. And does the same apply to the item of lamp repairs and have you in your report fully explained your reason for your disposition of that item?

A. I have.

Q. Now, in connection with your elimination of the ten per cent. paid by the Consolidated to the subsidiary companies, did you make any effort to find out what was the proportionate depreciation and taxes of the subsidiary companies applicable to the gas supplied to the Consolidated?

A. I did.

Q. And what success did you meet with?

A. I was refused any detail in connection therewith.

Q. By whom?

A. Mr. Carter.

Q. Can you give the leakage by months?

A. No.

4409 Q. How did you arrive at the leakage?

A. Detailed in Exhibit B.

Q. That fully appears in Exhibit B, does it?

A. Yes, sir; commencing with the balance on hand according to the company's record, January 1st, 1905, added to the quantities manufactured, the quantities purchased; deducted quantities sold to consumers, street lamps and other companies, took into account the stock at the end, and the balance was the leakage, including the gas used by the companies themselves.

Q. I notice in this exhibit to which you are referring, Exhibit B, there are certain entries in red ink and certain entries in blue ink. What do those represent or why have you put them in those colored inks?

A. The green ink represents the total manufactured——

Q. Is that green ink or blue?

A. Green—the total manufactured and total purchases. It is to show as a matter of convenience the totals under each classification. The red ink at the end, it would appear from that that the gas had been overdelivered; they delivered more gas than they had ever made.

Q. To what extent?

A. To the extent of that 117,000,000 feet plus the unmetred gas at the end of that month.

Q. Will you give us the figures showing that from this exhibit?

A. At the end of June they appeared to have over-delivered 117,461,270 cubic feet.

Mr. Mathewson: Where is that?

The Witness: Exhibit B. And at the end of July, 197,808,540 cubic feet; at the end of August, 94,143,629 cubic feet; at the end of September, 36,371,207 cubic feet; and it appears they got 4410 back with a balance on hand at the end of October and succeeding months.

Q. Does this amount 52.50 cents include any allowance for the Consolidated plant, for the use of the plant?

Mr. Mathewson: You mean any return on capital?

Mr. Burr: Yes.

A. No.

Q. Referring to your analysis of the item "sundry creditors" $3,357,037.95, will you point out where that appears in Exhibit 80?

A. Accounts payable, under accrued charges, $3,281,711.52, and again accounts payable, under accrued charges, balance, $75,326.43.

Cross-examination by Mr. Mathewson:

Q. What is your age, Mr. Hall?

A. Twenty-nine.

Q. How long did you say you had been in the accounting business?

A. Between thirteen and fourteen years.

Q. Are you a chartered accountant?

A. I am.

Q. How long have you been such?

A. Six years.

Q. How long have you been in America?

A. A year.

Q. Have you been with Marwick, Mitchell & Company all that time?

A. Yes, sir.

Q. Have you ever been in the business of manufacturing and distributing gas?

A. Never did anything else except accounting.

Q. Are you an engineer?

A. No.

Q. Have you ever examined the accounts of any gas company for the purpose of determining the cost of gas before you examined the Chicago companies?

A. Not for that purpose.

4411 By Mr. BURR:

Q. You mean you have, but not for that purpose?

A. Not for that purpose, yes.

By Mr. MATHEWSON:

Q. Did you have any Board of Advisory Engineers in Chicago when you made your examination there?

A. No.

Q. Have you ever kept the accounts of any gas company?

A. No.

Q. I see in the letter of January 22, 1906, to the Hon. Lynn H. Young, Chairman of the Committee of Gas, Oil and Electric Light of the Common Council of the City of Chicago, you stated—or Marwick, Mitchell & Company stated:

'No allowances however included in either statements' " (referring to your statements), for the wear and tear which is generally conceded to occur in excess of that which is covered by renewals."

What did you mean by the wear and tear that is generally conceded to occur in excess of that which is covered by renewals?

A. Depreciation.

Q. So that as an accountant you would agree with Mr. Yalden that there must be a certain allowance for depreciation beyond the actual expenditures for current renewals, would you not?

A. On certain items.

Q. Well, to a greater or less extent according to the character of the plant with which you are dealing?

A. Yes.

Q. And as an accountant do you take into consideration the fact that not only is machinery being deteriorated by wear and tear but that it is from time to time superseded and put out of use in favor of newer machinery?

A. Sometimes.

4412 Q. And that also is an element which must be taken into account, is it not?

A. To a certain extent.

Q. But so far as you are concerned you have never been, as I understand, in any gas business, so that you know by experience how much should be allowed in a gas business——

A. Will you repeat that.

Q. (Continuing:) for——

The **Master**: He has already said that, Mr. Mathewson.

Mr. **Mathewson**: Then I shall not repeat it.

Q. In Chicago then you proceeded on your own responsibility without the advise of engineers, did you?

A. Yes.

Q. Now, I find at page 3 of the report, City's Exhibit 87, you summarized the items which you have excluded from the operating cost of gas or from the total operating and fixed charges which amount to 74.81 cents according to Exhibit 94 is that right?

A. Yes.

Q. And your total is 22.31 cents?

A. Yes.

Q. Now, of those deducted items of 22.31 cents, how much is made up of contingencies, interest on funded debt and cost of street lamps?

A. 17.79 cents.

Q. So that outside of those three items of contingencies, interest on funded debt, and cost of street lamps, being respectively 8.29 cents, 7.32 cents and 2.18 cents, how much do the other items which you have excluded amount to?

A. 4.54 cents.

Q. With reference to the station cost of the gas made by the Consolidated Gas Company, Items 1 to 33 inclusive of Exhibit 94, showing, "Net amount of Material and Labor, $3,101,832.24, you have excluded nothing, but have divided by what divisor in reaching your cents per thousand? 4413

A. The quantity manufactured, 10,657,810,000 cubic feet.

Q. Is that corrected to a standard temperature of 60 degrees, or is is the uncorrected?

A. Corrected.

Q. All corrected, is it?

A. Yes.

Q. And do I understand that in the total of gas made you include the gas which has been used by the Consolidated Gas Company itself in lighting its own plant, and so forth?

A. Certainly.

Q. In that event you must introduce subsequently an item on the other side for gas received?

A. I do.

Q. So that as a matter of fact if your computation is correct and the computation of the company is correct upon its theory, there would be no practical difference in the end, would there?

A. Nothing serious.

Q. Do you know how the 29.10 cents in Exhibit 94 is reached opposite, "Net Amount of Material and Labor"?

A. Yes.

Q. What is the divisor in that case?

A. The quantity manufactured.

Q. The same thing that you have used?

A. Yes.

Q. Then there is no difference between you and the Company up to that point?

A. With this exception they do not carry the calculations down to the end, to the finish, on that basis they stop short there.

Q. On what?

A. They stop short on that point.

Q. Well, I am talking as to the items down to Number 33, "Net Amount of Material and Labor."

A. We agree there.

Q. And you understand that this litigation deals with what we may charge consumers for gas?

A. Yes.

4414 Q. Which is delivered to the consumers?

A. Yes.

Q. In other words, that our calculations have to be made on the number of thousand feet of sales?

A. Not in the case of manufacture.

Q. Well, we do not obtain anything from the consumer for the amount manufactured unless we deliver it to him? You understand that?

A. I understand that, but you——

Q. Now, if you divide the expenditure down to item 33, to wit, $3,101,832.24 by the amount of gas manufactured by the Consolidated, less the item of leakage, which means the amount which reaches the consumer's meters, you would obtain the 29.77 cents which the company expends, would you not?

A. Yes.

Q. Now, Item 34, repairs to apparatus $169,197.39, you allow in the cost of gas, less $2,133.98?

A. Yes.

Q. That latter amount is excluded on what theory?

A. On the theory that the amount going to make it up is properly chargeable to construction, not to operation.

Q. Will you point out in this report the details of that small sum?

A. Schedule 2 to Exhibit D.

Q. Did you exclude these on your own initiative or upon instructions from the three engineers whom you have mentioned, or some of them?

A. On the advice of the three engineers.

Q. The vouchers that you examined indicated that these expenditures had been made, did they not?

A. Oh, certainly.

Q. And in fact as to all the items in Exhibit 94, they appeared to be correct according to the books and records of the company, do they not, and your exceptions were only to their application to operating cost or otherwise?

A. That is so.

4415 By Mr. Burr:

Q. That was not true of renewals?

A. Renewals is simply a book entry.

By Mr. **Mathewson**:

Q. How much do you say this $2,133.98 amounted to in cents per thousand?

A. .02 of a cent.

Q. Now, on Exhibit 94, Item 34, repairs to apparatus in total appears to have been carried in the cost per thousand of gas made at 1.59 cents and in the cost per thousand sold as 1.62 cents. Now, when you say that you deducted .05 of a cent, you mean, do you not, that you deducted .05 of a cent from the 1.62 cents to reach your 1.57 cents?

A. I do.

Q. But dividing by the gas made you would get an amount only .02 of a cent lower than the 1.59?

A. Yes.

Q. And presumably if you had divided by the amount of gas sold you would have gotten 1.60 cents instead of 1.62 cents for that item?

A. Yes.

Q. So that on this item No. 34, of repairs to apparatus, there is only a difference of about .02 of a cent, whether you count it on gas made or gas sold, as between you and the Consolidated Company's computation?

A. Yes.

Q. Now, on Item 35, repairs to buildings, $24,900.69, you have excluded, as I understand it, only $88.50?

A. Yes.

Q. This is also on the theory that that might be applicable to construction?

A. Yes.

Q. That is so small that you could hardly indicate in cents per thousands?

A. Not very well.

Q. Where are the items of that $88.50?

A. Schedule 3 of Exhibit D.

Q. The next item which you have excluded, or any part of
4416 it, is item 43, Cost of Gas Manufacture, under agency agreement, $997,039.89, which appears in Exhibit 94 as 34.01 cents per thousand of gas made and 34.82 cents of gas sold. You state you eliminated the ten per cent. profit on the gas manufactured by the companies under the agency agreements?

A. Yes.

Q. What do you mean by profit in that connection?

A. The 10 per cent. represents profit, including a certain allowance for depreciation and taxes.

Q. You do not mean to indicate that it would be profitable for the company to sell gas at the cost of labor and material, plus three cents, from your investigation of the books of gas companies, do you?

A. I don't indicate that.

Q. Now, will you indicate to me how you reached that?

A. The ten per cent. is simply an arbitrary charge. You are allowing profit. The purpose of this examination is to determine the cost of manufacturing gas.

Q. The purpose of this suit, you know, is to determine what we are entitled to charge consumers for the gas which we sell?

A. Yes.

Q. Now, will you indicate how you reached your 29.14 cents as the cost to the other companies under the agency agreement after deducting ten per cent. and five per cent. on the New Amsterdam construction? Where is that indicated?

A. Schedule 4 to Exhibit D.

Q. In Exhibit D, Schedule 4, I find a column headed, "Manufacturing Cost Plus 10 per cent." Who is responsible for the term "manufacturing costs"?

A. It so states in the agreement.

Q. It states what the Consolidated Gas Company shall pay?

A. As the manufacturing cost.

Q. You find that headed in the books of the company material and labor used to manufacture, do you not, or rather in the statements of the company?

4417 A. I don't recollect what the statement was, but the agreement states manufacturing cost, does it not?

Q. The agreements state, do they not, material and labor plus 10 per cent. as the price which the Consolidated Gas Company shall pay?

A. No, I think it is manufacturing cost.

Q. Don't you remember whether the amount paid by the Consolidated Company under these agreements is to be the material and labor plus 10 per cent. additional?

A. It states here cost of gas materials used and labor furnished in manufacturing gas, together with the so-called station repairs.

Q. Precisely. Do you mean to say the material and labor is the total cost of manufacturing gas?

A. Plus the station repairs.

Q. Have you got in any station repairs?

A. It states so in the agreement.

Q. Have you got in any station expense beyond the station repairs.

A. Exactly what is in it I don't know. Permission was refused, I was not allowed to examine it.

Q. One moment. Don't go into that. Have you got anything in there or is there anything included so far as you have observed, except material and labor and repairs?

A. I have not observed anything. I have not seen the details.

Q. You know, do you not, that there are additional expenses in the manufacture of gas known as station expenses?

A. There are very small expenses under that head.

Q. And you know there are distribution expenses at the station, do you not?

A. They do not enter into the manufacturing cost for this purpose.

Q. Do not the distributing expenses at the station enter into the station cost of gas?

A. No, I do not think so.

4418 Q. Won't you look at Exhibit 94 and see if there is not a distribution item 38, $31,855.34 that enters into the station cost of gas as you have computed it?

A. There is a very small fraction there.

Q. You do not understand that this item which you call manufacturing cost includes any taxes or insurance at the station, do you?

A. I admit it does not include taxes.

Q. Or insurance?

A. I cannot say whether it does or not. It may. As I state, we have not been afforded access to the detailed statement.

By Mr. Burr:

Q. Do you mean it may or it does?

A. It may or it may not.

By Mr. Mathewson:

Q. Is it your information that it does?

A. I have no information on the subject.

Q. Did not Mr. Carter show to your representative in his room a statement from these companies showing the details of the cost at which the gas was delivered to the Consolidated Company?

A. He held a statement out and said it is none of your business what is in it.

Q. He did not show you——

A. He simply held it up before me and would not let me take a copy.

Q. Was it not compared in detail to show whether the total corresponded with the items?

A. The total might have been compared but there was no information taken from it. We were not allowed to take it.

Q. Did not Mr. Carter tell you that he would not let you take that paper away, but that you could compare it there to your heart's content?

A. No, he would not allow us to take a copy.

Q. You did compare it so that you found the total amount 4419 represented the sum of the various items, didn't you?

A. The total did, but what was in the total we did not know.

Q. Did not you see what the various items related to when you took the total?

A. No.

Q. Did you yourself examine it for that purpose?

A. No.

Q. Do you know why your representative who did examine it did not take such details as he pleased from it?

A. He was not allowed to.

Q. That is your information?

A. Yes. The message came back it was none of our business what the composition of it was.

By Mr. Burr:

Q. Who examined that?

A. One of my assistants, Mr. Murtha.

By Mr. **Mathewson**:

Q. In getting the 29.14 cents, how much was taken off representing the 10 per cent., how much representing the interest on the construction of the New Amsterdam Company?

A. Interest 10 per cent. $85,445.96.

Q. How did you get that?

A. It was the amount shown in their books.

Q. Shown on the books of the Consolidated Company?

A. Yes.

Q. Did it show as the 10 per cent. on their books or did you divide and get the 10 per cent. or multiply?

A. It showed as the 10 per cent.

Q. When you compare the cost of gas to the Consolidated Gas Company and the cost of gas manufactured by these other companies under agency agreements, in order to make a just comparison you must know exactly what items were included in it, must you not?

A. It would be better.

4420 Q. And you do know, do you not, from Exhibit 94, from your information that some items of expenditure which were included in the Consolidated cost of 32.42 cents at station on gas made are not included in the cost of 29.14 as you have computed it to the subsidiary companies?

A. No, I do not know that.

Q. Don't you know that there are no distribution costs at the station included in the 29.14 cents?

A. Not except your statement.

Q. In other words, you do not know whether they include the same items or not?

A. That is so.

Q. If the Consolidated cannot manufacture all the gas which it delivers and obtains a large portion of its gas from other companies and it becomes necessary to determine how much the Consolidated Gas Company is entitled to charge to consumers for all its gas, you must take into account, must you not, the entire amount which it has to pay to acquire the gas which it does not itself manufacture?

A. No.

Q. You do not think that makes any difference?

A. They are only entitled to take what it costs the subsidiary companies for this purpose.

Q. Well, but do you include then the capital of what you call the subsidiary companies, that is, the companies under the agency agreement, in determining what the capital of the Consolidated Gas Company is?

A. I have not thought anything about the capital of the Consolidated Company.

Q. You would have to, would you not, if you excluded this three cents or ten per cent.?

A. No, not necessarily.

Q. Do you mean to say that the capital which produces three billion feet of gas which is obtained under the agency agreements is entitled to no return but bare cost of labor and material?

4421 A. It is entitled to a return as I have already stated. We would have added in the depreciation and taxes if we knew what they were, but in the manufacturing cost the capital does not enter.

Q. When you come to determine the capital which the Company is entitled to a return upon you must include the capital which produces this three billion feet which it obtains from other companies?

A. Yes.

Q. Now, as to the five per cent. which is paid on the New Amsterdam construction, which was undertaken in order to furnish a portion of this gas under the agency agreement, that would be a proper expenditure, would it not, if the gas had to be obtained?

A. No.

Q. It would not be a proper expenditure under any conditions?

A. Not under the cost of manufacture.

Q. Would it be a proper expenditure no matter where you classified it?

A. By the Consolidated Gas Company?

Q. Yes.

A. It is a proper expenditure but not under the cost of manufacture.

Q. So it would be a proper expenditure to pay the 34.04 cents to the other company that manufactures under the agency agreement, would it not, if the Consolidated Company had to have the gas, no matter how you classify it?

A. Oh, yes, the classification does enter into it.

Q. Yes, it does as you classify it. Now taking the cost at the holder which the Consolidated Company figures for its own gas at 33.17 cents, on gas sold (item 42) you have made a deduction if I understand of only .02 of one cent to that point.

A. No, I made a deduction of 1.83 cents.

Q. Oh, no, that relates to the cost of gas under the manufacturing agreement, does it not?

A. Total cost of gas at holders.

4422 Q. I am speaking now of Item 42, the Consolidated Gas Company's own station cost?

A. Station cost, yes.

Q. And I say you have deducted up to that point only .02 of one cent?

A. Yes.

Q. So that would leave on the basis of sales 33.15?

A. Yes.

Q. Now, let us take the next item which you criticise, Item 47, repairs to gas stoves $55,954.35. I understand that you do not question the propriety of that expenditure?

A. Not at all.

Q. And you understand that Exhibit 94 is a statement of expenditure and not of income, appears to be, does it not, or charges against expense and not income?

A. Yes, but the gas stove expense is not a charge. I should bring the rents into credits.

Q. That is another question. I am coming to that in a moment, Is it not a fact that repairs to gas stoves are included in operating cost of gas under both the forms of the Massachusetts Gas Commission and the forms of the New York State Gas Commission?

A. I cannot say.

Q. You do know that repairs to gas stoves are included under the English system of accounting, in which I suppose you are instructed, as part of the operating cost of gas, don't you?

A. As also rents are brought into the credits.

Q. But under the English system no balance is brought in, is it? In other words, on one side appears among operating costs the expenditures for repairs of gas stoves and on the other side among receipts appears receipts for rent for gas stoves, do they not?

A. Yes. But you must remember——

Q. Is not that the way?

A. The English accounts are not prepared on the same basis as this or for the same purpose.

Q. Well, we have heard a good deal about them, and as you came from the other side, I was inquiring a little further.

4423 You do not find in the English accounting that a balance is struck between the repairs of gas stoves and the receipts from gas stove rentals on the other side and merely the balance carried into the ac-ount, do you?

A. No.

Q. Do you know of any gas company where the method is not to include the repairs to gas stoves among the expenses and then put on the other side among receipts the rentals from gas stoves?

A. Yes.

Q. You do know a company where they carry in merely a balance?

A. Yes.

Q. On this side?

A. Yes.

Q. What company?

A. I cannot name it.

Q. Now, you know that some companies have no gas stove rentals at all and yet have repairs to gas stoves among their operating expenses as an aid to the sales of gas, don't you?

A. If they do not have rentals, then they have the profits from the sale of the stoves.

Q. Don't you know that there are companies which have never been in the business of selling stoves at all which still have repairs to gas stoves among their operating costs?

A. Which they charge to the consumers?

Q. Yes. Just the same as they charge the repairs to his fixtures generally.

A. They charge that to the consumer and the consumer pays it; that is the jobbing department of the business.

Q. No, you misunderstand me. Don't you know that there are companies which do not sell gas stoves at all, but which have in their cost of gas not specially charged to the consumer except as they get it from the price of gas, the amount which they expend for repairs to gas stoves, as well as repairs to gas fixtures of the consumer?

A. I have never seen a company like that.

4424 Q. You have never known such as case as that?

A. No.

Q. Don't you know that in the City of Boston there are stove repairs but no stove receipts?

A. I don't know anything about Boston.

Q. If the company was not in the business of renting stoves, then it would have, would it not, expenditures for stoves with no off-setting items of receipts?

A. Which would be paid by the consumer.

Q. Well, the consumer pays everything when he pays his gas charge?

A. No. He would be billed for the repair of that stove.

Q. But in Boston, we will say, he is not billed for the repair of that stove. That would go, would it not, the same as repairs on any other apparatus, into a part of the cost of gas?

A. No.

Q. What would become of it?

A. I don't think it would be a fair charge against the cost of gas under those conditions.

Q. In spite of the fact it is the practice of large companies, you do not think that is right?

A. No, I do not.

Q. Where would it go or what would become of it according to your theory?

A. For the purpose, it may be charged against profit and loss, but it is not a charge against the manufacture and distribution of gas.

Q. Pretty nearly every account goes into profit and loss at the end of the year?

A. Well, that is not the cost of manufacturing and distributing of gas.

Q. Do you consider the expenditure for repairing the fixture of the consumer, the ordinary burner, as a charge against the price of gas?

A. Yes.

Q. Why not then repairing the fixture which is also a burner on his gas stove?

A. No.

Q. Why not?

A. You are making a profit on the sale of this stove.

4425 Q. I am assuming we do not sell the stoves at all, as is the case in many companies; why then is there any distinction between repairing his burner which he uses for an open flame and repairing the burner in the stove which he used for the gas for cooking, what is the distinction?

A. It appears to me there is a distinction.

Mr. Burr: I call Mr. Mathewson's attention to the fact that he has already elicited that Mr. Hall never ran a gas works.

Mr. Mathewson: I understand; that is quite obvious.

Mr. Burr: And never operated a gas plant.

Mr. Mathewson: That is also obvious.

Q. Let us take item 49, repairs to services $89,033.42. I understand that you have eliminated there $1,850.31?

A. Yes.

Q. That I think you said was an amount so small that figured in cents per thousand it was hardly appreciable?

A. Hardly appreciable.

Q. But will you tell me where the detail of that small deduction appears if you have given it?

A. Exhibit D, schedule 5.

Q. Now, the next item, any portion of which you exclude, is No. 51, repairs to buildings, $15,116.68, of which you exclude $2,845.75 or .09 of one cent. Where does the detail for that appear?

A. Schedule 3 to Exhibit D, the last four items.

Q. Is that on the theory that these last four items—beginning with Hester Street branch, is that right?

A. Yes.

Q. Were really construction and not repairs?

A. Partly that. Of this $1,678.13 was charged against the revenue received from other properties, from rented property.

4426 Q. Is the only reason you exclude them because there were revenues from rented properties on the other side of the account?

A. Yes.

Q. Now, Mr. Hall, when we are determining the profits of the company in its gas business and the amount remaining applicable to return on capital, it would make no difference, would it, whether in repairs to gas stoves, for instance, the repairs to the stoves were placed on one side of the account and the receipts from stoves on the other side of the account, or whether a similar account were deducted from each side of the account originally, when you came to subtract the expenses from the receipts, the profits would appear the same in either case, would they not?

A. It makes a difference when you come to determine the cost of the manufacture and distribution of gas.

Q. I understand that is your view. I am going a little further than that. Take any one of the items to which we have referred. Like expenditure in care of street lamps, if you exclude that from expenditures in the operating cost of manufacture and distribution of gas, you must exclude the similar amount from the receipts on the other side of the account when you are striking the balance to find your profits, must you not?

A. Yes.

Q. And the amount of the balance will be just the same whether you include the item of street lamps in the operating cost of gas and include the corresponding receipt among receipts or whether you exclude it from the operating cost of gas and exclude the corresponding amount from receipts, will it not?

A. The balance in the profit and loss account would be the same.

Q. It is merely a difference of method in treating the items from an accounting standpoint when you come to figure up what your profits are, is it not?

4427 A. It is a very serious difference when you come to determine the cost of manufacturing and distributing gas to the private consumer.

Q. Well, that may be, but I say when we are determining the profits in our gas business it would be just the same one way as the other?

A. Yes.

Q. And if you exclude it from one side of the account you must exclude the corresponding item from the other side, must you not?

A. Naturally.

Q. Were these various items so far excluded on the advice of the engineers?

A. Several of the charges, the repairs to building accounts, repairs to apparatus were, the others I excluded myself.

Q. Referring to Item 53, the next one which you have questioned, street lamps, $289,259.09, did you know whether the expenditure for street lamps was included in the operating cost of gas by the Massachusetts Gas Commission and New York Gas Commission?

A. I did not study the Commissions.

Q. Was that excluded under the advice of the engineers?

A. It was not.

Mr. Burr: But they agreed with your exclusion of it, did they not?

The Witness: They were not consulted.

Mr. Burr: I think they have already testified about it.

Mr. Mathewson: Yes, I think they have, and therefore I shall waste no further time.

Q. Have you read Prof. Bemis' testimony and Mr. Marks' testimony in this regard?

A. No.

Q. Now, in reference to these rentals which you say were offset in connection with the repairs to buildings, in getting the sum which you have excluded, if the rentals are offset, then, of course, the buildings must be included in the capital of the company when you begin to figure the return to which it is entitled on capital? 4428

A. You get the return from the rent of those buildings.

Q. Whatever it may, you have already applied that now to reduction of operating expense, or an offset on certain items?

A. I have charged the expense against the revenue; I do not bring the rent of those buildings in as a credit, I simply eliminate the charges.

Q. But however you may treat that, if the rents received from buildings are to be credited in the Company's Gas business, it is entitled of course to a return on the capital invested on the buildings on the other hand when you come to figure that?

A. Yes, quite so. The rental on the buildings gives them a return on the capital invested in the buildings.

Q. Now, the next item which you have excluded is 54, Interest on Consumers' Deposits, $51,391.52. You know that the receipt of deposits of that character reduces the amount of bad debts of a company naturally?

A. Yes.

Q. And if that be the case, and these consumers' deposits be a sort of insurance fund against bad debts, as one of the witnesses stated, why is not the payment of interest on those deposits a proper payment like any other insurance item?

A. Because you have the use of the money as working capital.

Q. If we do not have the use of the money as working capital then it would be a proper charge in the operating cost of gas, would it not?

A. No, under no conditions.

Q. Why not, if it is an insurance fund, paid to reduce the amount of bad debts?

A. Because you have the use of the money.

Q. Well, but assume that we could not use it, that it was in a trust fund, or something else, would not we then be entitled?

A. You can invest it.

4429 Q. You don't know where we can invest it to get six per cent., do you?

A. You can get pretty near it.

Q. I wish you would tell me privately afterwards where you can invest it at that rate?

A. I think I can.

Q. Now, this next item of bad and doubtful debts, $82,995.11, you did not exclude, but you made some comments on it. Do you happen to know how much of a deposit under the laws of the State of New York the company can exact?

A. I understand two months.

Q. And don't you know that frequently consumers use in one month more than they ever have in two preceding months, so there is a loss even if the company takes a deposit?

A. It would be rather exceptional.

Q. Well, $82,000 is not an exceptional amount of bad debts upon a business of more than $13,000,000, is it?

A. It could be considerably reduced, I think.

Q. Well, you say you have never operated a gas plant?

A. No.

Q. And have never tried?

A. Have never tried.

Q. Do you know of any company that has any less than .63 of one cent per thousand in bad debts?

A. Yes.

Q. Which?

A. I cannot state that.

Q. And you appreciate that if we did not take deposits from consumers upon which we are bound to pay interest that the bad debts would be very largely increased as a natural course, would they not?

A. Yes.

Q. And do you remember whether you asked from the company information as to the amount of bills for gas which the company was obliged to extinguish from consumers' deposits which had been made with it?

A. I talked the matter over with them.

4430 Q. And didn't you get the figures?

A. I certainly saw figures.

Q. It amounted to $70,000 or $80,000 or such a matter, did it not?

A. I don't recall.

Q. Now, let us take Item 58 of Exhibit 94, expense of general office, $339,999.51. You excluded from that $31,075.95, if I understand you correctly?

A. Yes.

Q. Will you point out the place of the report where you detail that?

A. Schedules 6, 7 and 8 of Exhibit B.

Q. Schedule 6 which amounts to $25,671.74, covers does it not, expenditures in 1905 attributable to the investigation of the Company by the Legislative Committee in the Spring of 1905?

A. Yes.

Q. Attorney's fees, stenographer's charges, expenses, printing of one kind and another in connection with that?

A. Yes.

Q. It is your view, is it not, that the Company in connection with a matter of that kind is entit-ed to employ counsel and to take the ordinary steps to protect itself and its stockholders within reason?

A. At the expense of the stockholders.

Q. Well, let *let* us see about that. How about the attorney's fees that the Company ordinarily pays, I see you have included those?

A. That is a necessary charge against any business.

Q. Certainly. Do you mean to say that if a company appears before a Legislative Committee that that is not a legal expense which it is entitled to charge in ordinary operating expenses, but which must be specially borne by the stockholders out of their dividends?

A. Yes, sir.

Q. What authority have you for that proposition?

A. That does not enter at all into the cost of manufacturing and distributing gas, it is not a necessary expense. It is an expense by the stockholders to protect their own interest.

4431 Q. But how about the fees of counsel for appearing and in contesting a tax which is imposed on the Company?

A. There are certain necessary charges.

Q. There are certain necessary charges?

A. Yes, for ordinary business.

Q. Well, isn't it a matter of discretion with directors and officers as to what they contest or in what cases they appear?

A. Certainly.

Q. And do you mean to say appearance before a Legislative Committee is in any different category than appearance before a tax commission, in order to argue against the imposition of a tax?

A. It is.

Q. Well, why is it?

A. It is an expense, as I said, against the stockholders. They are fighting for their own interests, to keep up the price of gas then. It does not enter into the cost to the consumer.

Q. In other words, if the Company think that the price of gas is to be lower than is just, they are not entitled to ap-ear by counsel and make their argument unless it comes out of the stockholders themselves?

A. Not at the expense of the consumer.

Q. Don't you know that in England Parliamentary investigation expenses are always allowed and charged in the operating cost of gas?

A. Not in a case of this kind, they would not be.

Q. Will you point out any case in which it has been disallowed in England?

A. I cannot, but it would not be allowed in a case of this kind by any competent public accountant.

Q. Well, you say it would not. I want you to point out any case where it has been disallowed?

A. I cannot.

Q. Don't you know it has been in many cases allowed in England as part of the operating cost, the legal expense in a Parliamentary investigation?

A. It would not be in a case of this kind.

4432 Mr. Mathewson: I move to strike that out.

The Master: Strike it out.

Q. (Question repeated.)

A. No, I do not.

Q. You don't know whether it has been or not, do you?

A. No, I do not.

Q. Did you exclude this on the theory that it was a special charge and not likely to be repeated?

A. Yes.

Q. You did not find there in the expenses of 1905, any expense on account of the hearing before the Gas Commission, which began sometime in October, 1905, and was largely completed during the calendar year 1905, did you?

A. I think I did. I think there were some.

Q. Anything substantial?

A. I don't recall the particular amounts as I took them out. If they were there, they are out, and they could be identified.

Q. The greater part of all these expenditures took place before the hearing before the State Gas Commission began, which proceeded finally, I think, beginning about the 20th of November, 1905, did they not?

A. They appear to be. I see the last item there is State Gas Commission.

Q. Yes. $2,870.43 out of $25,671.74.

A. Yes.

Q. And of course you do not find anything there in connection with the present suits which were begun in May 1906?

A. No, there would be nothing under that.

Q. Does it not begin to look to you as though this was an exceptional expenditure, but one which the Company was currently undergoing from year to year?

A. No, I do not think that is continuous.

By the MASTER:

Q. You think if they conducted themselves properly they would not ever be investigated? 4433

A. I assume so.

By Mr. MATHEWSON:

Q. Now, as we are dealing with the present in a sense, is it your view that the legal expenses of the Company before the State Gas Commission when the law expressly provides that the Company may be and shall be heard by counsel is not a proper charge in the operating expense of the Company?

A. No.

Q. You do not think it is?

A. No, it is not.

Q. And you do not think the expense for counsel in these present actions would be?

A. No.

Q. Now I see in Exhibit D, Schedule 7, part of the excluded $31,075.95, you have $1,604.21 on account of five items ,including stenographic work and subscriptions to National Civic Federation. Do you exclude these various items on the same theory?

A. On the principle that they are extraordinary expenses, some of them, and some of them are not chargeable against operating at all, the cost of fitting up an office.

Q. Well, which are not?

A. The first and fifth.

Q. Well, divide them according to the theory you have just en*n*unciated, which of them are extraordinary expenses and therefore not liable in operating expense?

A. Second, third and fourth.

Q. And the first and fifth are not allowable because they are not——

A. They are charges to capital and the first one is a charge to Astoria, according to the voucher.

Q. Well, that would be $85.50?

A. Yes.

Q. And $369.21?

A. Yes.

Q. Or a total of how much, if you have your pencil handy?

A. $454.71.

Q. You do not think they would be chargeable to operation even if they were not extraordinary expenses? 4434

A. Under no conditions.

Q. They then should go to increase capital account?

A. Yes.

Q. And wherever you have excluded items on the ground they are not proper operating expense, but should have been charged to construction, by so much the capital account of the Company should be increased?

A. Naturally.

Q. And that would be true for as many years as such items have been charged by the Company in a similar manner?

A. No.

Q. That is, if they are not chargeable to operating expense but are to construction, in any case, those items should not be added to increased capital, whenever they were expended, of course?

A. Yes.

Q. Now, let us see Exhibit D, Schedule 8, where we have $3,800, making the balance of $31,075.95 which you excluded from Item 58. This appears to be damages on account of an accident, that is, explosion at a holder at 21st Street. It is true, is it not, that this represents payment to three men for injuries received at the explosion of that holder?

A. Yes.

Q. Well, now, why should not they be charged to operating expense?

A. Because they are not an operating expense, they are part of the cost of building that holder.

Q. You think they should be charged to capital account and the cost of the holder increased by the ordinary cost plus these $3,800 worth of damages?

A. In the ordinary course they would be.

Q. Well, the whole holder was destroyed at that time. Would you add the damage by destruction of the holder plus the damages received by these men plus the cost of the new holder as the
4435 cost of the new holder?

A. That is a loss of capital, yes, sir.

Q. Well, what is loss of capital except operating expense if you wear out a piece of apparatus and it has to be charged off?

A. Will you repeat that, please?

Q. (Question repeated.)

A. A loss of capital is not an operating expense.

Q. Do you mean to say that if a piece of apparatus wears out or depreciates in use that the amount of that depreciation is not chargeable in operating expense?

A. Ordinary wear and tear is chargeable or ordinary depreciation.

Q. But if it blows up instead of wearing out in the ordinary way you do not think it would be chargeable to operating expense?

A. It is not.

Q. Supposing a piece of apparatus becomes obsolete and has to be replaced by another piece of apparatus, you would charge off the cost of the apparatus to depreciation, would you not?

A. Yes.

Q. And the cost of the new apparatus to construction and the difference between the two would represent your addition to capital account, would it not?

A. Yes.

Q. So that the cost of the old apparatus in that case which you charge off would be in effect an operating expense, would it not?

A. It would be if provided for by your depreciation from year to year.

Q. Yes, in other words, that provision for depreciation is part of the operating expenses of a company?

A. Certainly.

Q. Don't you know as a matter of fact that explosions big or little in a gas company and injuries to employees are ordinary and usual incidents of a gas business and not anything extraordinary?

A. Not the explosion of a holder in course of construction.

4436 Q. Well, supposing this holder had not been in course of construction but had just been completed, how then about the payment of $3,800.

A. If the holder was in operation and being used, any accident happening them as naturally an accident might, would be in the course of the company's business.

Q. And that would be chargeable then to operation?

A. Yes.

Q. Now, referring to the next item, 62, Real Estate Rents, you exclude from the $42,674.71 only $625, if I understand?

A. Yes.

Q. And that is not appreciable in figuring the cents per thousand?

A. No.

Q. In which exhibit are the details of that?

A. There are no details given; that represented the rent of an office for three months.

Q. So that we really may disregard that?

A. Yes, it does not make any particular difference.

Q. In reference to the next item to which you object, or any portion of it, Item 65, insurance, $54,031.83, you exclude only $152.44 and that also is negligible virtually, is it not?

A. Yes.

Q. And you have not produced details?

A. No.

Q. Let us take taxes, $965,843.88, will you point at where I will find the details of the $222,692.62 which you have excluded from that item?

A. Page 33 of the report.

Q. Of the total taxes of the company to make up this sum last mentioned you exclude taxes on income from investments in other securities, $5,257.48; taxes on real estate from which the company draws rent, $2,928.85; taxes on dividends in excess of four per cent. $120,000; interest on unpaid taxes, $4,506.29, total $222,692.62. Now, the first item is excluded by the company's computation. Why do you deduct taxes on real estate from which the company draws that $2,928.85?

4437 A. It is a charge against the rents received from the properties from which they drew those rents.

Q. Have you not applied the real estate rents against repairs?

A. No.

Q. Did you not in getting the $1,600 and odd dollars to which you have testified previously?

A. No.

Q. Do you not appreciate that *it* begin business where large parcels are required, several city blocks for instance, it is economy in the operation of a company to acquire the entire block even if there may be some particular which they cannot use at the moment?

A. It might be.

Q. Well, in that view, the real estate which they thus acquire, assuming it to be a prudent investment in the business, would be part of the capital upon which the company would be entitled to earn a return, would it not?

A. In that proportion that it earn a return from the rent of the building.

Q. Well, but the return from the rent of the buildings would be credited for whatever it might appear to be?

A. Yes.

Q. And you could conceive of a situation, could you not, in which if the company received no rent from the building it might be economy for the company to own a small lot where it owned all the rest of the block and made noises and smells and other nuisances which might be complained of if the property was in the hands of other persons?

A. Yes.

Mr. **Burr**: This is all speculation.

Q. And if the company employs this land or is entitled to include this land as part of its capital prudently in the gas business and the rents received from real estate are credited, why should it not be entitled to charge the amount which it pays for taxes?

4438 A. It is entitled to charge it against the rents.

Q. Entitled to charge it to profit and loss as you have proved, is that right?

A. Yes, against the rents and not to the consumer.

Q. It would make no difference in the profit of the company if the items balanced, whether this was included in the cost of gas and the corresponding item in the receipts and whether they were taken from either side?

A. Yes, but it makes a difference in the cost of gas.

Q. Yes, you can figure the cost of gas down to nothing by offsetting enough items on each side and have $4,000,000 left clear.

A. No, I did not follow that out.

Q. But the point is the more of these items which you take out of the operating cost of gas and at the same time take the corresponding amount out of receipts, the lower you are reducing the apparent cost of gas or operating cost of gas in every instance, is not that so?

A. Yes.

Mr. **Burr**: And the converse is true?

The **Witness**: Exactly.

Q. Now, where do you get the $120,000 which appears at page 33 of your report under "taxes on dividends in excess of four per cent."?

A. On page 33, these are the same items the company used.

Q. Then with the exception of the $2,928.85 taxes on real estate from which the company draws rent, the only item left in which there would be a difference is $94,506.29 interest on unpaid taxes. On what theory did you exclude that particular operating expense, Mr. Hall?

A. Well, it was not an operating expense?

Q. Well, why?

A. That is merely a book entry on your part in the meantime.

4439 Q. Well, but you understand, do you not, that the tax has been assessed?

A. Yes.

Q. And is adjudged against us at present?

A. It is a tax of previous years, consequently not a charge against 1905.

Q. You understand that interest has been running against this tax and that it has accrued in previous years up to 1905?

A. Yes.

Q. And this covers only the portion of that interest accruing in 1905?

A. Yes.

Q. And if we make an expenditure for counsel fees in contesting a tax which the company believes to be an improper one, you are entitled to charge, you have said, the counsel fees as part of the operating expenses?

A. Ordinary counsel fees, I said.

Q. Well, we have no extraordinary counsel fees in our company?

A. Contesting taxes would be.

Q. And wasn't a portion of this interest, amounting to $94,506.29, actually paid in 1905?

A. I do not recall whether it was actually paid or not.

Q. Whether it was actually paid or not would make no difference, would it?

A. None.

Q. The point is that being interest on taxes which are contested, the company would not be allowed to charge that as an operating expense?

A. Certainly not.

Mr. Burr: And he said on former years.

The Witness: Those are taxes of former years.

Q. Well, assuming it was a tax assessed in 1905?

A. Yes.

Q. And interest has been running for a part of 1905 on that tax which we are contesting?

A. We admit the 1905 tax.

Q. How is that?

A. We admit the 1905 tax.

Q. Do you admit any interest accrued on taxes of 1905?

A. No.

4440 Q. So that it does not make any difference whether it was the tax of 1905 or some other year, whether you allow the interest or not?

A. We would not allow it in any case.

Q. In other words, if the company sees fit to contest a tax, considering that it is a prudent action to contest it in the courts, while they are entitled to charge their legal fees they are not entitled to charge interest if they have to pay the tax with interest ultimately, is that right?

A. No, it is not.

Q. Is that right?

A. No, it is not right. They are not entitled to charge the legal fees in that connection.

Q. Oh, they are not entitled to charge the legal fees?

A. No, not in that connection.

Q. Just explain a little, I do not understand you?

A. That is purely speculative, the matter of contesting those taxes.

Q. You mean when you go into the courts you are going into speculation?

A. It is purely speculation when you are contesting the tax.

Q. Is it your view that if a tax is assessed against the Consolidated Gas Company, which its officers and directors believe to be doubtful, and are so advised by counsel, that the company is not entitled to contest the tax in the interest both of their stockholders and consumers?

A. They are at liberty to contest the tax. But it is in the interest of the stockholders.

Q. And also of the consumers if it prevents the piling up of heavy taxes, because taxes are chargeable as part of the operating cost of gas?

A. They are charged as part of the operating cost of gas.

Q. So indirectly it affects consumers as well as stockholders?

A. Not when gas is selling at a fixed rate.

Q. But the point which we are trying to determine in this case is what is the proper price to be charged for gas? 4441

A. Yes.

Q. So as to meet the proposition?

A. Yes.

Q. Let me ask you again, isn't it your view that the counsel fee in contesting a tax under advice of counsel is properly chargeable as an operating expense to the company?

A. If you are contesting the present year, but in this case you are contesting past years.

Q. I do not quite see the distinction, but I think I will get at it. Supposing the company pays this year to counsel a fee for contesting a tax which was assessed in 1904, the contest being made in 1905, is it your view that they could not charge to the operating cost of gas the fees for counsel in contesting that tax?

A. No, you cannot charge it——

Q. You cannot charge it in 1905 because it was a 1904 tax.

A. Exactly.

Q. But you could charge it so long as the charge did not exist and the services had not been rendered in 1904?

A. I don't think you could charge it to arrive at the cost of this gas.

Q. So that you reduce it to this: that you never can charge counsel fees in the operating cost of a gas company unless performed in the very year in which the tax is assessed and in relation to that particular tax?

A. No, I don't say so.

Q. Well, I wish you would explain a little because I am hazy as to your theory. When can you charge a counsel fee for contesting a tax in the operating cost of a gas company, and when can you not?

A. You can charge to the operating cost the ordinary, general expenses of the business; not such items as counsel fee for contesting a franchise tax?

Q. You can never charge that?

A. Not against the cost of operation.

Q. No matter whether the tax is assessed in the particular year with which you are dealing or not? 4442

A. No.

Q. And no matter whether the services in contesting the tax are rendered in the particular year?

A. No.

Q. And the same theory applies in your view, does it, to the further expense of protesting a tax, that is to say to the interest which would accrue on it?

A. That is right.

Mr. **Burr**: I believe you have already stated that it is the fixed principle of the Company to contest all taxes.

Mr. **Mathewson**: I have never said anything of the sort. On the contrary, we are paying taxes largely, and I think we are the largest taxpayer in the City of New York, or at least have been for a long time.

Mr. **Burr**: When you pay.

Mr. **Mathewson**: Yes, when we pay and as we pay. How does the city stand as a payer of its debts, as far as the Gas Company is concerned?

Mr. **Burr**: We are perfectly willing to pay you when you are willing to accept.

Q. Now, take the next item to which you object, No. 67, contingent expenses, (includes renewals and replacements) $1,328,316.37. I understand that in effect you rejected the whole of that and then substituted for it $167,427.84?

A. Yes, plus the depreciation from the gas stoves, making $222,382.82.

Q. And that amounts to how much?

A. 1.71 cents per thousand feet of gas distributed.

Q. Do you mean the gas sales?

A. Gas sold to the consumers.

Q. Now let us see where you deal with that. Is that on
4443 page 34 of your report?

A. 34 and beginning of page 33.

Q. Now I understand you to say that the renewals and replacements which appear as part of the 10 cents are not actual expenditures?

A. It is stated so in the books depreciation.

Q. Now let us see. You understand by the Company's books that 10 cents per thousand feet was charged in its accounts to represent actual renewals and replacements plus a contingent or reserve fund, the 10 cents to cover all that I have stated have you not?

A. An arbitrary charge to cover that.

Q. You understand that at the conclusion of the year, into that account is written the amount of renewals and replacements?

A. No, I do not.

Q. You did not understand that?

A. No.

Q. Didn't you know that a portion of this $1,328,316.37 was covered by items written in representing renewals and replacements at the end of the year?

A. No.

Q. The balance only of that sum representing what might be called a contingent or reserve fund?

A. No, I did not.

Q. Now let us look at page 34 of your report for a moment. You have "plant" $3,424. That represents, does it not, the cost of sundry plant and apparatus, dismantled, to make room for new plant, and apparatus plus the cost of dismantling, less what was recovered from the sale of old apparatus as scrap or from its use as repair material. Also the book value of plant and apparatus sold, less the amount recovered?

A. It so states.

Mr. Burr: That is quoting from the resolution?

Mr. Mathewson: Yes:

4444 Q. In other words, when a piece of apparatus was worn out and abandoned you found that the cost of that, as appears in the book, was charged off?

A. Yes.

Q. It would be depreciation, if you please to put it so, whatever you please to call the account?

A. Yes.

Q. And if other apparatus were acquired within the year, that the cost of that other apparatus was charged to capital or construction?

A. Yes.

Q. So that the cost of the old apparatus would represent a replacement or depreciation?

A. No, it would represent a depreciation?

Q. If you take the new apparatus at the cost which is charged to capital, that represents to a certain extent replacement of apparatus which has been charged off or is worn out, and become useless, does it not?

A. This particular amount is charged off as depreciation, as the entry appears here.

Q. Yes, I understand, but I simply ask you as to the facts; is not my statement a fair one?

A. Do you mind repeating it?

Mr. Mathewson: The Stenographer will repeat it.

The Stenographer (Reading): If you take the new apparatus at the cost which is charged to capital, that represents to a certain extent replacement of apparatus which has been charged off or is worn out and become useless, does it not?

A. Yes.

Q. So that if apparatus amounting to $3,424, which is the amount mentioned, is abandoned, and apparatus representing $10,000 is installed, that $10,000 expenditure would represent the expense of $3,424 of replacement and apparatus abandoned, would it
4445 not?

A. No. It would represent a depreciation of the old apparatus.

Q. Yes, a depreciation, and if you please to put it in another way, it would represent a replacement to that extent?

A. You might call it that. I wouldn't.

Q. Well, that is what we do call it?

A. Well it is wrong.

Q. Well, in that event it would not be a mere charge off without any corresponding effect on capital account because the capital account would be increased only by the difference between the cost of the new apparatus and the cost of the old apparatus which is charged off?

A. It might be in that particular case.

Q. And if that be the case there is no criticism on your part, is there?

A. There is a criticism.

Q. What is it?

A. That account was depreciation. This account marked here.

Q. You mean it is headed, "Depreciation" in the company's books.

A. No. It is depreciation.

Q. If a greater expense is made for apparatus than this $3,424, isn't the apparatus of the company replaced to the extent of $3,424, even if you consider it first charged off to depreciation?

A. Then your accounts are not properly kept?

Q. Do not worry about that; we will take care of that. Just answer the question.

A. It must be in that particular case of plant.

Q. Well, let us take mains and see what about them: Mains, $90,561.54. That appears to be the cost of mains abandoned during the year and of mains replaced during the year.

Mr. Burr: The book value of mains abandoned.

Mr. Mathewson: Yes, very good. Abandoned during the year, and of mains replaced during the year with mains of larger 4446 capacity, less the value as scrap of the old mains taken up.

Q. Now you find, do you not, that if mains were replaced by larger mains, the cost, as appeared on the books, of the mains taken up was charged off to depreciation?

A. Yes, sir.

Q. And you found, did you not, that the cost of the larger mains which was installed, was charged to construction?

A. Yes.

Q. And the net result is that your cost of main, cost of new main, is a replacement of old main abandoned, to the extent of $90,561.54?

A. No, sir.

Q. And that only the balance represents new construction and capital account, isn't that so?

A. No, that is a depreciation of your old mains.

Q. Let us forget the words and get at the substance. As a matter of fact, if you have $90,000 worth of mains which are charged off and you get $100,000 of new mains within that year, so far as your main account is concerned, it means that you have charged off $90,000 worth of mains, that you have replaced them by the new mains and that you have carried $10,000 more to capital account, doesn't it?

A. Yes.

Q. So that it makes no difference at all whether you call this depreciation or not. If you have put down $100,000 of new mains you have replaced $90,000 worth of mileage, and it does not show in the capital account at all, and you have charged $10,000 more of mains at cost into the capital account, because it is beyond the cost of the mains which were replaced, isn't that right?

A. That is what it comes to, the net result.

Mr. Burr: Are you speaking of an assumed condition or from the books of the company?

Mr. Mathewson: No, I am speaking of the exact condi- 4447 tion, the substance and not the words. It has been testified over and over again what the situation is, and I do not care what you call it, that is the fact.

Q. Now, we have services, for the book value of services taken up or cut off or abandoned in the streets, $37,401.00. That you say is depreciation?

A. Depreciation.

Q. But don't you find in the company's method of keeping its accounts, that if it put in other services new that year to the extent of $50,000, that it would carry into capital account only a difference between the $37,401 and the $50,000 as an increase to capital?

A. That may be, but it does not alter——

Q. But don't you find that to be the fact?

A. Yes.

Q. So that as a matter of fact of that $50,000.00 expended for services $37,401.00 would be a replacement of services to the same extent as they were charged off to depreciation, isn't that so?

A. That is your way of looking at it.

Q. With your way of looking at it this $37,401 would represent an actual expenditure for new services, wouldn't it?

A. No, sir. That is a depreciation of the old services.

Q. But if new services are put in, or new mains are put in, to the value of the services or mains charged off, and do not go to increase the capital account, but the capital account is increased only by the difference between the mains or services charged off and the total expenditures for constructing mains and services, then as a matter of fact it amounts to a replacement of the mains and services up to the extent of the mains and services charged off, doesn't it?

A. I do not see it that way.

Q. Doesn't it amount to the same thing?

A. No, I do not see that.

4448 Q. What do you mean by depreciation in a case like this where a main of 6 inch diameter is replaced by a main of 30 inch diameter?

A. When you lift the old main out of your books that is depreciation. The new main is straight construction.

Q. But if the main is put down it is a replacement of the old main to the extent of the old main?

A. No, a new main is straight-out construction work.

Q. But it does not yet appear as within the capital account?

A. No, because you necessarily must take the old main out of the books.

Q. Precisely, and then does not the whole expenditure for mains represent a renewal of your mains value to the extent of the mains charged off, and doesn't it represent additional capital to the plant beyond the amount of mains charged off?

A. It represents additional capital.

Q. Is my question answered in the affirmative?

(Question repeated).

A. The plant represents additional capital.

Q. And does not the expenditure, excluding the plants, represent in effect a renewal or a replacement of your mains value to the extent of the mains charged off?

A. No, the expenditure represents absolutely new construction.

Q. But doesn't it represent a renewal or replacement of mains value which you have lost or abandoned to the extent of what you have lost or abandoned?

A. No, I don't see it that way.

Q. If a railroad lays a 100-pound rail instead of a 60-pound rail, does that 100-pound rail have to be charged to new construction or to additional capital?

A. Additional capital. The 60-pound rail would naturally be written off as depreciation.

4449 Q. Would not the cost of a 100-pound rail represent an investment of the 60-pound rail to the extent of the original cost of the 60-pound rail?

A. It might.

Q. Would it?

A. No, the 100-pound rail is new construction.

Q. Wouldn't it represent a replacement of the 60-pound rail to the extent of the value of the 60-pound rail?

A. Yes.

Q. And if you put in a 36-inch main in place of a 6-inch main, does not the same hold true?

A. Yes.

Q. And if you put in $100,000 worth of mains and lose or abandon or charge off $60,000 worth of mains in the same period, wouldn't that represent a replacement in your capital account of $60,000 worth of mains charged off plus $40,000 more to new capital?

A. It represents an additional capital of $40,000. It represents $40,000 worth of new capital?

Q. Won't you answer the first part? Doesn't it represent a replacement in your mains account of $60,000 worth of mains which you had lost by charging of- other abandoned mains to depreciation?

A. No, I won't say that.

Q. Forget you are an accountant and just give me an answer to the question in ordinary terms. You have lost $60,000 worth of mains because they have been abandoned?

A. Yes, sir. That is depreciation.

Q. You have now put in $60,000 worth of mains which brings your capital account, so far as capital account is concerned, up to the original level?

A. Yes.

Q. And you put in $40,000 worth of mains which now appear in your books as new or additional capital or construction?

A. Yes, sir. That $100,000 represents new construction.

4450 Q. But is not $60,000 of that in effect a replacement of that amount in your mains value, so that it brings your capital merely up to the level at which it stood before you charged off the $60,000 of old mains?

A. It brings your capital up to that level, but your $100,000 is new construction and $60,000 is depreciation.

Q. Is not replacement of a 60-pound rail by a 100-pound rail on a railroad new construction also?

A. The 100-pound rail is new construction.

Q. Or does it replace the 60-pound rail to the extent of the value of the old 60-pound rail abandoned?

A. If you look at it that way, it may, but that is not the way to look at it.

At 5 P. M. adjourned to December 4, 1906, at 10.30 A. M.

Last Exhibits:

Complainant's, 256.
State's, Y.Y.
City's, 87.

4451 Circuit Court of the United States, Southern District of New York.

Consolidated Gas Company of New York, Complainant,
vs.
Julius M. Mayer, as Attorney General of the State of New York; William Travers Jerome, as District Attorney of New York County; Frederick E. Gunnison, John C. Davies, and Lucien L. Shedden, Constituting the New York State Commission of Gas and Electricity, and The City of New York, Defendants.

Before Arthur H. Masten, Special Master.

New York, *December* 4, 1906.

Met pursuant to adjournment.
Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Kirby.

4452 Mr. Burr: I want to note a correction on page 4364 of the record. The figures 1.08 on the third line from the bottom should be .03.

James Hall resumes the stand, and further testifies:

Cross-examination by Mr. Mathewson (continued):

Q. You included in depreciation and as an operating charge items to the amount of $222,382.82, if I understand you correctly?
A. Yes.

Q. And the reason you deducted from the total amount of depreciation charged off, to wit, $282,219.67 the sum of $59,836.85, was because you conceived that that sum represented charges applicable to the years prior to 1905?
A. Yes.

Q. Now, the reason why a depreciation account is allowed in an operating expense is, is it not, that a company is entitled to keep up its property, to maintain its property?
A. It is.

Q. Now, a depreciation account, speaking technically, is never an account of expenditure, is it?
A. No, sir.

Q. It is the marking off or down of apparatus or property disused or lost, or which should come out of the property account as a living asset?
A. Yes.

Q. Now, the expenditure comes in, does it not, when you come to produce more property by new construction to take the place of the property which has been marked off by depreciation?
A. Yes.

Q. And when you make an expenditure for new construction equal to the amount which has been marked off in depreciation you have then replaced in the property account a similar amount of property and brought your total property account back to the former figures?

A. Provided the items can be identified one with the other.

4453 Q. Oh, yes, assuming that. And then any addition to new construction would represent an addition to property account?

A. Yes.

Q. Up to the extent of the amount of the items charged off to depreciation this new construction would merely represent a replacement of property account to the extent which it had been charged off to depreciation?

A. Always provided there was a connection between the items.

Q. Now, let me show you Complainant's Exhibit 79, showing the treatment of the accounts from 1884 down to date. In this case you see in one column the valuation at the time of the consolidation in 1884?

A. Yes.

Q. And then in the second column you see "construction since consolidation?"

A. Yes.

Q. And in the third column you see "depreciation (renewals) since consolidation"?

A. Yes.

Q. And the net increase appears to be, does it not, the difference between the total construction and the amount which has been marked off in depreciation fund, or whatever you please to call it?

A. That appears to be so.

Q. So that in that case the net increase of property in the case of plant in this exhibit would appear to be $3,904,937.31?

A. It would.

Q. While to new construction, $5,132,620.41 was applied, $1,227,683.10 to replace items which had been marked off in depreciation, leaving the balance $3,904,937.41 net?

A. Not necessarily.

Q. Well, that would be the effect of it?

A. That would be the effect of it.

Q. And so, too, for each one of the other items of property appearing in Complainant's Exhibit 79; they appear to have been treated in the same way, do they not?

A. They do.

Q. And the marking off of depreciation on the property of the corporation where it is proper makes available a fund for the 4454 purpose of replacing that value in property by new construction?

A. Yes.

Q. And that is where the actual expenditure comes in?

A. In the new construction account.

Q. And the amount expended in new construction to keep up or replace the property marked off to depreciation would, of course, exactly equal the amount marked off to depreciation?

A. Not necessarily.

Q. To keep the property up to its original value? Wouldn't it?

A. Do you mind repeating the question?

The STENOGRAPHER (reading): And the amount expended in new construction to keep up or replace the property marked off to depreciation would, of course, exactly equal the amount marked off to depreciation, to keep the property up to its original value, wouldn't it?

A. Yes.

Q. Now, are you familiar with Field's Analysis?

A. I have seen it. I have studied it to a certain extent.

Q. You were speaking yesterday about investigating expenses. Will you look at this Field's Analysis for 1905, and see whether "Law and Parliamentary Expenses" are not included there?

A. They are.

Q. In the operating cost of gas?

A. They are; but, as I stated yesterday, this was prepared for a different purpose.

Q. Don't you know that the parliamentary expenses there referred to are parliamentary committees and investigations?

A. I understand what they are.

Q. That is true, isn't it?

A. Yes, that is quite true.

4455 Q. And these parliamentary investigations, as a rule, are for the very purpose of determining the price which may be charged by different companies for gas, in investigating their conditions of manufacture generally, are they not?

A. I understand so.

Q. Now, the $282,219.67 of items charged off for depreciation, less the $59,836.85, which you deducted from that amount in reaching your net figure of 1.71 cents appear at pages 34 and 35 of your report?

A. Yes.

Q. In figuring 29.14 cents as the average cost of gas to the companies delivering it to the Consolidated Gas Company, including cost of labor and material and whatever is stated in the agency agreements, did you take into consideration the fact that one of the companies, the Central Union Company, did not maintain gas of the candle-power required by the Consolidated Gas Company for all the year 1905?

A. I did not study the question of candle-power.

Q. Your attention was not drawn to that fact?

A. It was not.

Q. As to leakage; you say that you have included in this 52.5 cents an allowance for leakage amounting to .73 of a cent?

A. Yes.

Q. Will you tell me how you obtained that figure?

A. Take the amount of the leakage of 300,000,000 odd cubic feet, the cost of manufacture 31.69 cents, and divide by the amount distributed.

Q. By leakage you include unaccounted-for gas?

A. Unaccounted-for gas.

Q. And gas used by the company itself?

A. Yes.

Q. You spoke of the difference between the 29.14 cents at which you figured gas of the other companies and about 34 cents at which price the Consolidated Company paid for it as return on capital. You do not mean that that was return on capital of the Consolidated Gas Company? 4456

A. No; the subsidiary companies.

Q. And so far as the Consolidated Gas Company is concerned, it expended, did it not, according to the records, the amount specified in Exhibit 94, which is 34.82 cents per thousand feet of sales, in order to procure the gas?

A. Yes.

Q. How much did you deduct from that figure to get your 29.14 cents? I mean in dollars and cents?

A. $142,580.32.

Q. Now, as we are dealing with the price at which the Consolidated Gas Company can sell its gas, and not return on capital of the other companies, will you divide that amount by the amount distributed, sold by the Consolidated, of 13,283,000 feet, and let me know how much that amounts to in cents per thousand on the entire sales of the Consolidated?

A. Approximately 1.1.

Q. Then if that was to be added to your 52.5 cents, that would make 53.6 cents?

A. It would.

Q. Now, the 53.6 does not include any amount to equalize the repairs and renewals in the year 1905 with the average for the previous twenty years, as was done by Professor Bemis and the other witnesses, does it?

Mr. Burr: Will you point out where Professor did it?

Mr. Mathewson: Is there any doubt that he did do it? I cannot point it out now.

The Witness: I do not know anything about Professor Bemis' evidence.

Q. I supposed you had been in consultation with Professor Bemis?

A. I have not.

Q. You didn't know, then, that he did it that way?

A. I didn't know what his evidence was at all.

Q. I see. I assumed you were familiar with it. Well, that does not include anything to equalize the depreciation or repairs and renewals, whatever you please to call them, for the year 1905, with the average of the twenty years prior to 1905, does it? 4457

A. In my opinion, the depreciation written off here is for the purpose of averaging it to what you consider your fair average depreciation.

Q. What is your basis for supposing that is the fair average depreciation?

A. The statement appearing in the books on page 34.

By the **Master**:

Q. You mean the resolution of the Board of Directors?
A. The resolution of the Board of Directors.

By Mr. **Mathewson**:

Q. Is that the sole foundation for that belief on your part?
A. Yes.
Q. Now, as a matter of fact, you yesterday examined State's Exhibit L, by which it appears that the total amount of the repairs and the depreciation fund (or renewals—as they are denominated) was 7.34 cents for the year 1905, did you not?
A. No.
Q. You did not see this?
A. No, I did not see that.
Q. I think it was shown you?
A. I saw it in another connection.
Q. Now, it appears that the repairs and depreciation (or renewals) for the year 1905 amounted to only 7.34 cents, and it also appears in evidence that for the twenty years preceding 1904 they averaged 10.89 cents, or a difference of 3.55 cents below normal in 1905, below the average. An equalization, I think, was added by each witness, at any rate by some. Will you now add 3.55 cents, which would equalize for the twenty preceding years to the 53.6 cents, if you can do it in an instant, and tell me what that would make if they are averaged. 57.15, isn't it? 4458
A. 57.15.
Q. That would be 57.15 cents, would it not?
A. Yes.
Q. Did you make any allowance in your cost for the additional enrichment due to the 22 candle power gas?
A. Before you get away from this, I do not say that I add this 3.55.
Q. I understand you do it at my request.
A. Yes, at your request I make that computation.
The **Master**: Acting as his computer?
The **Witness**: Acting as his computer.
Q. I am merely adding to see where we get with respect to the computation of the other witnesses.
A. I do not wish to take any responsibility for it.
Q. Did you make any allowance in your cost for additional enrichment due to 22 candle power gas, whereas only 20 candle power gas was required for the first half of 1905?
A. No, I find in your records that the candle power averaged 25 to 26.
Q. Well, however that may be, that is in evidence and you need not to trouble yourself about that proposition. You have never run a gas business and you do not know what margins there may be necessary in this locality.

Mr. **Burr**: He is only telling you what appears by your books.
Mr. **Mathewson**: That is already in evidence by another witness.

Q. The Gas Commission, as the papers in evidence show, figure 1.8 for additional enrichment, for the additional candle power of 22 candles, as against your 20 candles. Will you take two-thirds 4459 of that, or 1.2, and add it to 57.15, and see if it would not give you 58.35?

A. It would.

Q. And if we add to that the 2.18 for street lamp maintenance, following the forms of the Massachusetts Gas Commission and the New York Gas Commission, that would make, would it not, 60.53?

A. Yes.

Mr. Burr: I do not see that this is a proper cross-examination. He is assuming, if he puts back all these things he has eliminated, it will indicate a certain figure. I do not see that it proves anything.

Mr. Mathewson: I am seeking if he proceeded on the basis of the two Gas Commissions it would not produce a certain result. I think I am through, with one or two more questions, on this line.

Q. Did you observe in connection with this Chicago investigation that Professor Bemis allowed 3 cents for reserve or contingent fund or for the depreciation, which you said you had not estimated but which must be allowed in Chicago?

A. I don't recall P*or*fessor Bemis' evidence in Chicago.

Q. Well, I will say to you that he allowed according to the testimony 3 cents for depreciation or reserve there in addition to actual depreciation charged off, and also before the Gas Commission in New York a similar 3 cents last winter. Now, if we assume the same reserve fund to be permissible and add to it 60.53, that would make a total of 63.53, would it not?

A. It would.

Q. That would exclude repairs to gas stoves and interest on consumers' deposits and the taxes to which you object and the general office expenses which you have ruled out, would it not?

A. It would.

4460 Q. And it also would exclude all fixed charges of the company upon its outstanding obligations or return upon capital?

A. Yes.

Q. Will you now turn to the portion of your report dealing with the leakage month by month upon which you commented yesterday?

A. Exhibit B.

Q. You found that upon your basis of computation in June, July, August and September there would apparently be an amount of sales exceeding the amount manufactured, did you?

A. Yes.

Q. Now take the month of June, for example. You know, do you not, that the meters are read all through the month of June at different periods?

A. Yes.

Q. And that a meter read on the 3d of June would carry a period from the 3d of May to the 3d of June and be largely in May?

A. Yes, I know that.

Q. And that what you get in this kind of a computation is simply an average reading which would occur as of the middle of each month?

A. Yes.

Q. And that the amount therefore of the sales as it is produced by these meter readings is not the amount of actual sales for the month with which you are dealing?

A. I recognize that.

Q. While the make, on the other hand, is the actual make for the actual month?

A. That is true.

Q. So that there might be a discrepancy and would be some discrepancy between the two?

A. One practically offsets the other, under ordinary conditions.

Q. Well, there would be some discrepancy?

A. There naturally is, yes.

Q. Take, for instance, the calendar month of April; that has thirty days?

A. Yes.

Q. And you get thirty days' make?

A. Yes.

Q. On the other hand, if you take the month, the average reading as April 13th, you would get from March 13th to April 13th, which would be 31 days; that would be a very substantial difference, would it not? 4461

A. It would.

Q. When you take the entire year, however, you find by the figures which you quote on Exhibit B, that the leakage is 2.21 cents, as I see, which corresponds with the company's figures, does it not?

A. It does, a difference of three million feet, I think.

Q. A trifling difference?

A. A trifling difference.

Mr. Burr: Which way?

The Witness: Our leakage is less than the company's. I took into account the stock on hand at the beginning and end, which they did not.

Q. The company's was 2.22?

A. Yes; there was very small difference.

Q. Nothing more than would be likely to occur in casting it up?

A. No.

Mr. Burr: He says he took into account the amount of gas on hand, which the company did not.

The Witness: The company did not.

Mr. Mathewson: Yes, I see.

Q. Will you turn to the figures that you have made on the real estate account of the constituent companies forming the Consolidated in 1884? Where is it?

A. At the very back of the reports, the last one, page 3.

Q. In making the figures you took the cost of the real estate as it appears on the books of the constituent companies, did you?

A. Yes.

Q. And you took their figures of charges for depreciation and charges for appreciation?

A. Yes.

Q. Did you go through with great care and see what pro-
4462 portion has been charged off for depreciation, what percentage
year for year, percentage on the value of the property?

A. Would you mind repeating that question?

(Question repeated.)

A. I did not work out the percentage; I went over the account with care.

Q. Is it not the case that in a great many instances of charges for depreciation you could not tell from the books of the companies whether it related to real estate or not?

A. No.

Q. You accepted Yalden's figures as to the Metropolitan Company, you say?

A. I did.

Q. Did you also accept his report in excluding the Knickerbocker Company?

Mr. Burr: How do you mean, excluding the Knickerbocker Company?

Mr. Mathewson: Any assets of the Knickerbocker at the time of the consolidation.

A. The Knickerbocker assets were included in the Municipal Company assets, in the Municipal Company books.

Q. But beyond what they were included in the Municipal Company's books, you assumed no assets for the Knickerbocker, did you?

A. No assets.

Q. Let us take the Manhattan Gas Light Company. It appears by its books that the buildings and improvements stood originally at $1,378,691.45, does it not?

A. Yes.

Q. You know that land was bought in 1835, something like that?

A. Yes.

Q. And yet the accounts of the Manhattn Gas Light Company, just prior to November 11th, 1884, showed a valuation of buildings and improvements and land actually $21,700.00 less than the original cost; is that right?

A. Yes.

4463 Q. Now, when you show in the third column appreciation
on transfer to Consolidated on November 11th, 1884, you find that this appreciation was written up on the books of the constituent companies, don't you, at that time?

A. It was not written up in the books of the constituent companies; it was that difference between the book value and the price at which the Consolidated took it over.

Q. Did you find any record in the books of the constituent companies of that appreciation?

A. In some cases.

Q. And, of course, you have no means of knowing what the increase in value of the land of the Manhattan Gas Light Company from 1834 or 1835 down to 1884 was?

A. No.

Q. And the same would apply to the other five companies?

A. Yes.

Q. How do you know whether your data as incorporated in the first column on page 3 of this schedule relating to real estate as showing what the real estate of these constituent companies cost agree with the figures of Mr. Yalden?

A. They do not.

Q. In what respect do they differ?

A. The Manhattan Gas Light Company's figures differ; the Harlem Gas Light Company's figure differ, and the New York Gas Light Company's figures differ.

Q. In what way do they differ?

A. Mr. Yalden included in the Manhattan Gas Light figures certain apparatus amounting to $1,994,745.29. I excluded that.

Q. What about the other two companies to which you referred?

A. In the Manhattan a reference to Mr. Yalden's report gives the most of the figures; in the Harlem Gas Light Company Mr. Yalden did not include certain charges which I included. I make the figures considerably higher than Mr. Yalden does. Then in the case of the bulkheads and office buildings at Harlem, I could not 4464 determine the cost to the company, consequently I allowed what the Consolidated paid for them.

Q. As a matter of fact, while your first column is headed "Original Cost, Buildings and Improvements," it really refers to the real estate, the land with whatever buildings there were on the land?

A. Yes.

Q. And so, too, as to the other columns on page 3 of this schedule, they likewise relate to the land plus any buildings thereon?

A. The real estate only.

Q. Not buildings which formed part of the plant of the company, the manufacturing plant?

A. So far as I could determine, no.

Q. But they do include the general office buildings of the company and other improvements of that kind as might have existed outside of the buildings which form the plant of the company?

A. They do.

By Mr. Burr:

Q. Does not that all appear in Rowland's appraisement, and does it not also appear in these schedules attached to your report on the real estate, what real estate was transferred on the 11th of November, 1884, by these companies to the Consolidated?

A. It does.

By Mr. Mathewson:

Q. While you have headed this first column, "Original Cost," your information comes wholly from the books of the constituent companies, does it not?

A. It does.

Q. And you found it was very difficult in some cases to ascertain original costs, didn't you?

A. Yes, sir, in one case.

Q. Which case was that?

4465 A. The Harlem Gas Light Company, and in that case my figures differed from Mr. Yalden's to the amount of $180,000, giving the company the benefit.

Q. And did you not find the books of the constituent companies entirely satisfactory in every detail?

A. In that one case, I did not; in the others, they were very well kept.

Q. You were informed, were you not, that in reference to the Metropolitan Company's books and some others which were not to be had, a careful search was made and the company was unable to find them in their files?

A. I was.

By Mr. BURR:

Q. You do not know whether a careful search was made or not?

A. No.

Mr. MATHEWSON: I did not ask him that, but whether he was so informed.

By Mr. MATHEWSON:

Q. In other words, there was no refusal to give them, so far as you have observed?

A. So far as I observed. I was informed that a careful search had been made.

Q. Do you mean to say that you found the real estate account of the Knickerbocker Company in the books of the Municipal Company?

A. A study of Yalden's report states so.

Q. Well, but did you find it in the books of the Municipal Company?

A. I cannot distinguish it.

Q. You cannot?

A. No.

Q. Now, yesterday, if I understood you correctly, you said that the general practice of gas companies was not to make any profit on merchandise business, which would include stove sales, and you subsequently said that the company should not charge gas stove repairs to operating expense because the company makes a profit on 4466 the sale of the stoves. How do you reconcile those two theories or answers?

A. The point is, the companies certainly aim to make a very small margin of profit, and they do not run the business to get a return on capital invested in gas stoves.

Q. They do make some profit, or are supposed to?

A. A very, very small margin.

Q. And that is the explanation, and the only explanation, is it, of the two replies to which I have called your attention?

A. Yes, the company aims to come out just on the right side.

Q. Don't you know that some companies put stoves in at no charge whatever to the consumer, merely for the purpose of inducing a large consumption of gas?

A. The selling price of that stove includes the putting in.

Q. I am speaking about putting in the stove at no cost or price whatever to the consumer, delivering the stove gratuitously to the consumer and allowing him to use it gratuitously for the purpose of increasing the sales of gas.

A. I never heard of such a case.

Q. Now, did the Municipal Company's accounts indicate the location of the real estate shown on the books of that company, the cost of which you undertook to ascertain?

A. I would prefer to refer to my original data to answer that.

Q. Have you not your original data here so that you can tell?

A. No.

Q. You did have a schedule of the real estate of both the Knickerbocker and Municipal Companies, did you not, so that you would have been able to ascertain whether the Knickerbocker real estate was included in the Municipal schedule?

A. I can ascertain that with reference to that data.

Q. Haven't you done so, so that you can reply now?

4467 A. I did go into it, but I do not recall just at the moment.

Redirect examination by Mr. Burr:

Q. Mr. Mathewson has asked you did you find the books of the constituent companies very satisfactory. I ask you did you find the books of the Consolidated Gas Company very satisfactory?

A. In some ways.

Q. And in some ways not?

A. And in some ways not.

Mr. Mathewson: Do not lead him. He is your witness; let him testify.

Q. In what way did you find the books unsatisfactory?

A. Unsatisfactory?

Q. Yes.

A. There did not appear to me to be a proper method of accounting for the stock and material purchased.

Q. Will you explain that a little more in detail?

A. When the material was purchased it was charged up to the account, for example, repairs to apparatus or meters, whereas it ought to be charged to a stock account, and then when used charged out to the different accounts, the different operating or construction accounts of the company.

Q. Was that a proper method of keeping that account or a loose method of keeping that account?

A. It appears to me to be a loose method.

Q. A method, would you say, whereby the company——

Mr. Mathewson: Wait a minute. Supposing you let him testify about this. I want his views, if we are going to have them, and not yours. He saw the books and you did not.

Q. Would you say by that method the company would lose money?

4468 Mr. MATHEWSON: Well, is not that a little bit extreme?

Mr. BURR: What is the difference between well-kept books and ill-kept books, between loose methods and strict methods?

The MASTER: You may ask him if you choose what the effect on the business of that method would be.

Q. What would be the effect on the business of the Consolidated Gas Company through the books being kept in that manner which you have described, with regard to that particular account?

A. There would be a tendency of storekeepers and superintendents to take advantage of the company.

Q. Because they could take advantage of the company without being readily discovered?

A. Exactly, because no correct note is kept of stock which goes in and goes out, so far as my information goes, it is that no stock books are kept, consequently they cannot check up the quantity of stock on hand.

Q. And did you discover that each station kept its own books, its own set of books, showing repairs, or what method did you find was adopted and carried out by the Consolidated Gas Company in regard to labor and material used at the station?

A. My information is, from Dr. Marks and Mr. Lacombe, that station books are kept.

Q. In adding these figures which Mr. Mathewson has asked you to add to your 52.50 cents, do you wish to be understood as approving the addition of those figures?

A. Certainly not.

The MASTER: He made that very clear, Mr. Burr.

Q. Are you aware of the circumstances under which these figures were presented in this case?

A. I am not.

4469 Q. Or in any other case?

A. I am not.

Q. I want to ask you in regard to the mains, the abandoned mains of 1903 and 1904; where were those charged up or when were they charged up in the books of the company?

Mr. MATHEWSON: The statement shows in 1905, $59,000, and we have gone all over that.

Mr. BURR: So that you apparently understand that, Mr. Mathewson?

Mr. MATHEWSON: Yes, it is perfectly clear in the report as to his charging them off; that is lucid.

Q. You were asked with regard to wear and tear. Is wear and tear allowed for in the 1.71 cents which you have allowed in your 52.50 cents?

A. It appears to be, from the resolutions from the company embodied in the report.

Q. You refer to the resolution appearing on page 34 of your report?

A. I do.

Q. Your attention was called to the stove repairs yesterday. Does the company treat all its receipts separate from its expenditures?

A. It does not.

Q. Does it not, as a matter of fact, deduct the amount it receives from jobbing, including its profit, from the cost of operating?

A. Yes.

Q. And as a matter, does it carry over the balance of the jobbing account to the cost of distribution?

A. It does.

Q. Then, according to that, it treats the receipts from jobbing and stove rentals in a different manner?

A. It does.

Q. If all the charges and credits which appear in the account of the Consolidated Gas Company for its stoves were included in one account, what would be the result shown?

A. The expenses would amount to $217,635.40 and the
4470 rents $122,332.60, leaving a balance at the debit side of $95,-
302.80, or .75 cents per thousand cubic feet of gas distributed.

Q. So that the 52.50 cents, cost of gas as found by you, actually includes .73 cent for cost of the stove department?

A. Yes.

Q. Is the full amount of the tax assessed for 1905 included in the cost of 52.50 cents?

A. Yes.

Mr. Mathewson: He means applicable to the gas business; those other items were excluded.

Mr. Burr: He means just what he said.

Q. That being so, if there was an additional charge made on account of the cost of contesting the levy of previous years' taxes, the accounts of 1905 would bear more than their fair proportion, would they not?

A. They would.

Q. Can depreciation always be equalized by actual expenditures in each year?

A. Would you mind reading that?

Q. Can depreciation always be equalized by the actual expenditures in each year?

A. No.

Q. As a matter of fact, the expenditures for renewals will exceed the average allowance required in some years, will they not?

A. They would.

Q. And in other years they will be less than the requirements?

A. Yes.

Q. How, in your opinion, should this discrepancy be equalized?

A. By forming a renewal fund each year and charging up to that fund all renewals and replacements, that renewal fund to be a fair average for previous years.

Q. That is, by charging a sum equal to the difference between the average amount required and the actual expenditures?

A. Yes.

Q. And when the expenditures exceed the requirements, what would be done with the excess?

A. Stand to the debit of renewal fund.

4471 Q. Charged to reserve or renewal fund account?

A. Yes.

Q. That is, the fund created for that purpose in previous years?

A. The fund created for that purpose in previous years.

Q. When does an allowance for depreciation or contingencies first appear on the books of the company?

A. You refer to the 10 cents per thousand?

Q. I refer to the 10 cents per thousand.

A. May, 1905.

Q. Does that appear in any schedule annexed to your report?

A. No, not annexed to it; it is referred to in the body of the report (handing book); it is referred to there.

Q. Is that allowance of ten cents, in your opinion, an excessive amount?

Mr. MATHEWSON: Wait a minute. This witness is not in the gas business and is not an engineer, and he is asked whether an allowance of ten cents per thousand for contingencies in the gas business is an excessive allowance or not. I submit he is incompetent.

The MASTER: Is that competent?

Q. Can you say whether or not that is an excessive amount?

Mr. MATHEWSON: Wait just a minute. The witness is not entitled to reply to that because it is for the Master to say whether he is competent on his qualifications shown here.

The MASTER: It does not seem to me, in view of his statement, he is competent.

Mr. BURR: I will withdraw the question. We have already gone over that very thoroughly.

Q. What is the name of the account in the Consolidated
4472 Gas Company to which the charge of $282,420.83 finally
deducted under contingency and renewal account were originally made?

A. Depreciation.

Q. You say the renewal and contingency account first appeared in the books of 1905?

A. It did.

Q. What is the amount included by you in the account for 1905 for repairs, and what is the amount per thousand cubic feet?

A. Repairs amounted to $715,151.44, or 5.61 cents per thousand cubic feet manufactured and distributed.

Q. Are any renewals and replacements included in these expenditures?

A. Yes.

Q. And is the amount of these repairs and renewals along with the amount included as depreciation sufficient, in your opinion, to have kept the plant in a thorough state of efficiency and to have replaced all waste which may have taken place during the year?

Mr. Mathewson: Objected to, as the witness is wholly unqualified.

Mr. Burr: This does not require a gas expert or professor to answer.

Mr. Mathewson: Yes, it does.

The Master: He can answer it if you think it is of importance, simply from the standpoint of an accountant, comparing it with other plants, but I do not think it amounts to anything unless he can show that the ratio of those things in the gas business is the same in every other business which he examines.

Mr. Burr: I will ask him what he bases his answer on.

The Master: How is his answer of value unless you do show that?

Mr. Burr: I will ask for the reason.

4473 Mr. Mathewson: I would like an exception, on the ground that the witness is incompetent to reply.

The Master: I will let him answer.

Mr. Mathewson: Did you sustain the objection or overrule it?

The Master: I overruled it and you except.

The Witness: What is the question?

(Question read.)

Mr. Mathewson: I did not understand that he was to ask that question. I except to that. That is clearly incompetent.

The Master: One moment. I will sustain the objection. You can take it over the objection.

Mr. Burr: And I except.

Q. What is the answer?

A. It does.

Q. On what do you base that statement?

Mr. Mathewson: Same objection and exception.

The Master: Same ruling.

Exception.

A. The fact that in all large corporations the repairs in any well sustained plant practically keep it up to date and the margin of depreciation is trifling, it would be very, very small in a large corporation, and that margin is provided for in the depreciation written off by the company.

Q. That is in that 1.71?

A. Yes, sir.

Q. And therefore, in your opinion, there is no further allowance necessary to offset the gradual depreciation caused by wear and tear in the capital assets, which you admit should be made good out of revenue?

A. No.

Mr. Mathewson: Objected to both as leading, and as the witness is incompetent to testify.

4474 The Master: Objection sustained.

Mr. Burr: Exception. You called his attention to the situation as found in his report at Chicago, and I called his attention to it as he found it here, and am asking whether any additional allowance should be made over the 1.71.

Mr. Mathewson: I have not asked him any such questions.

The Master: The question was asked and it is ruled upon. There is no need of further discussion.

A. There is no further allowance required.

Q. Is there anything in the accounts of the Consolidated Gas Company submitted to you to show that an amount equivalent to $3,424, charged on account of plant to the contingency and renewal account, was actually expended during the year 1905 on the replacement of old plant by new?

A. Do you mean by a similar piece of plant—do you mind repeating that?

Q. (Question repeated.)

A. No.

Q. I am especially referring to the items as they appear in the resolution attached to your report on page 34.

A. Yes.

The Master: I do not understand what you mean by an amount equivalent to the amount of $3,000.

Mr. Burr: Well, I mean was that amount or any such amount.

The Master: An amount equivalent to the amount of $3,000 is $3,000, is it not?

Mr. Burr: Yes. I will change that.

4475 Q. To show that the amount of $3,424 charged on account of plant to the contingency and renewal account was actually expended during 1905 on the replacement of old plant by new?

A. No.

Q. Is there anything in the accounts of the Consolidated Gas Company, as submitted to you, to show that the amount of $90,561.54 charged on account of mains to the contingency and renewal account was expended during 1905 on the replacement of old plant by new?

A. No.

Q. I ask you the general question, was there anything in the accounts of the Consolidated Gas Company, as submitted to you, to show that the amounts respectively, of $37,401.00 for services, $25,646.20 for meters, $31,570.89 for meter cocks and connections; $5,338.62 for horses, wagons and harness; $8,140.87 for office furniture and fixtures, and $24,483.65 for tools and implements, were actually expended during 1905 on the replacement of old plant by new?

A. No.

Q. And the same situation applies to gas stoves and automobiles?

A. It does.

Q. Gas stoves, $54,954.98, and automobiles, $697.92?

A. Yes.

Q. In your testimony yesterday, Mr. Hall, at the bottom of page 4433 and top of 4434 you were asked:

"Q. You do not think they would be chargeable to operation even if they were not extraordinary expenses? A. Under no condition.

Q. They then should go to increase capital account? A. Yes.

Q. And wherever you have excluded items on the ground they are not proper operating expense, but should have been charged to construction, by so much the capital account of the company should be increased? A. Naturally.

4476 Q. And that would be true for as many years as such items have been charged by the company in a similar manner? A. No."

Will you be a little more explicit in regard to what you actually mean?

A. Let me see it, please? (Testimony handed to witness.) (Reading) "Q. And wherever you have excluded items on the ground they are not proper operating expense, but should have been charged to construction, by so much the capital account of the company should be increased," with regard to items which should originally have gone to construction only, with regard to items such as legal expenses, which we excluded.

Q. But you had in mind only those items——

A. Only the construction charges I had in mind.

Q. Which should have been properly charged to construction?

A. Yes.

Mr. MATHEWSON: We concede that we ought not to capitalize legal expenses, and that is why we charge them in operating expenses. We have to do one or the other.

Q. For what purpose do you understand Field's Analysis is prepared?

A. For the purposes of comparison and for the purposes of complying with State requirements.

Q. Statute requirements?

A. Statute requirements.

Q. Mr. Mathewson has called your attention to situation claimed by him to exist in regard to the meters in June and July and the met-red gas in June?

A. Yes.

Q. What have you to say as to that?

A. Were the met-red gas at the end of any month taken into account my statement as submitted in Exhibit B would be decidedly different, and would be altered. Of course, the unmet-red gas in one month offsets the unmet-red gas in any other month. Were the total sales for any other month taken in, take the month of December, all the met-red gas for the month of December, the result would be quite different; there would be no such balance as I give here. 4477

Q. Turning to Exhibit B, showing the gas made, purchased, sold and so forth, will you add the gas made and purchased in June, 907,163,250 feet, July, 615,470,770 feet, August 689,883,910 feet, September 906,466,471 feet, October 1, 199,791,920 and see if it amounts to 4,318,776,321 feet?

Mr. Mathewson: Were those figures taken from the schedule Exhibit B?

The Witness: That appears to be right.

Q. Now, add the gas sold during those months; June, 1,024,624,520 feet; July 813,279,310 feet; August, 784,027,539 feet; September, 942,837,678; October, 1,089,808,184, and see if it amounts to 4,654,577,221?

A. It does.

Q. Does this include any gas used by the company or lost by leakage or condensation?

A. No.

Q. Subtract from the sales of gas the feet of gas made and purchased during those five months, June, July, August, September and October and see if the excess of sales over gas made and purchased was 335,800,910 feet?

A. It was.

Q. Is this excess of sales over 42 per cent. of the total sales in August?

A. It appears to be about 42 per cent.

Q. How much gas was on hand June 1st?

A. 24,268,390 feet.

Q. How much was on hand November 1st?

A. 109,983,736.

Q. Was the increase in gas on hand 85,715,346 feet?

A. It was.

4478 Q. Add this to the excess of sales over gas made and bought of 335,800,910 feet, and does the total amount to 421,516,256 feet?

A. Yes.

Q. Is this the real increase of gas made and bought over sales in five months?

Mr. Mathewson: Whether or not it is appears from these figures what it is.

Mr. Burr: From that exhibit.

A. Repeat that question.

Q. Does this appear to be the real increase of gas made and bought over sales in five months as appears by that exhibit?

A. The increase of sales over gas made and bought?

Q. Increase of gas made and bought over sales in five months?

A. No.

Q. What does it show?

A. It shows you have sold more than 421,000,000 feet in excess of what you have made.

Mr. Mathewson: And bought.

Q. That is the same thing, isn't it?

A. I probably took it up wrong.

Q. Is this over half of the total sales of either July or August?

A. Yes.

Q. Would in your opinion therefore a difference of two or three days in the meter readings account for this excess of gas made and bought of over fifteen day's consumption?

A. No.

Q. What is the explanation that you can give?

A. That is what I cannot give. I have been trying to find out what its explanation is for some time past.

Q. Never have been able to get any explanation from the company?

A. I cannot get it.

4479 Q. Now, your attention has been called to the real estate accounts. You examined, as I understand, carefully all the books and data which were submitted to you on that subject by the officers of the Consolidated Gas Company?

A. Yes.

Q. And you have stated in your report there the books which you examined and the books which were missing?

A. Yes.

Q. And the manner in which you have arrived at the conclusions stated in your report?

A. Yes.

Mr. Burr: That is all.

Recross-examination by Mr. Mathewson:

Q. Do you mean to say that the company makes no correct note of the material and supplies that it receives?

A. Nothing that I could consider a correct note.

Q. Don't you find that it has a record of the supplies which it has received and the amount of such supplies?

A. I have not seen it.

Q. Do you mean to say that they have no record of the supplies or material which go out to make repairs?

A. I understand they have.

Q. You understand they have?

A. They have, yes.

Q. And you do know that every particle of material which is used in repairs or new constructions is accounted for and they have a note of it?

A. I understand so.

Q. Did you visit the branch station and see what accounts they had there?

A. I was not allowed to.

Q. You did not have time to, did you?

A. I could have made the time if I had been permitted.

Mr. Burr: He made the demand and was refused.

Q. Well, how did you make the demand?

A. The demand was made in my behalf by Dr. Marks, I understand.

4480 Mr. Burr: And I make it also and you objected because he was not a gas engineer.

Mr. Mathewson: We never made any objection to his going to the stations at all.

The Witness: I would have been delighted to have gone there.

Q. As to jobbing items, being placed in the cost of gas, did you know that jobbing was done without any profit but at a cost to the company?

A. The profit was ten per cent. in some cases.

Q. For jobbing?

A. For jobbing.

Q. Do you think, that the company, according to the figures you examined, makes a profit on jobbing?

A. In certain pieces of jobbing they made a profit of ten per cent.

Q. Over cost of labor and material?

A. Over the amount of the bill they paid to Smith Brothers for doing the work.

Q. What was that?

A. Several heaters and other pieces of appliances on which Smith Brothers did the work and supplied the material, the company billed out at a profit of 10 per cent.

Q. This was the case in which you say they carried the balance in to the cost of gas?

A. Yes.

Q. In other cases, don't you find as a general rule that the jobbing was done at cost?

A. As a general rule, the small jobbing.

Q. When you say that the taxes of the company are included in the 52.5 cents which you stated, you do not include all the taxes of the company, do you, whether assessed on the securities of other companies or otherwise?

A. Excluding those assessed upon the securities of other companies, yes.

Q. And also excluding interest?

A. Excluding interest, yes.

Q. When you say that 10 cents per thousand appears in
4481 the company's books first in May, 1905, you find, do you
not, that the custom of charging 10 cents per thousand to cover depreciation and contingent expenses and so forth was at that time entered so as to cover the year from January 1st?

A. It was.

Q. The system was changed on January 1st?

A. It dated back to January 1st.

Q. When you gave your opinion over objection that the amount for repairs and depreciation was sufficient to keep the property up, you said among other things that in large companies the depreciation was small. What company have you ever managed, gas company or electric company?

A. Never managed any companies.

Q. Have you read Professor Bemis' testimony in the Boston case as to the amount expended even by English companies for repairs, depreciation and so forth?

A. I have not.

Q. You did not know that he testified it was nearly 13 cents for large English companies, then?

A. I don't know anything about his testimony.

Q. Do you know what the English companies do charge for depreciation and repairs and renewals per annum?

A. No.

Q. Don't you know that many of them charge more than 12 cents?

A. I do not.

Q. Did you not figure out that with your repairs at 5.61 cents and depreciation at 1.71 cents it amounted to only 7.32 cents per thousand?

A. I did.

Q. Don't you know that large electric companies frequently have to virtually scrap and rebuild their electric plants within ten years time by reason of the progress in the art?

A. Yes.

Q. Don't you know that in the gas business there have been processes which 20 years ago were considered excellent, which
4482 were totally discarded within 10 years and other apparatus had to be substituted?

A. I did not know it.

Q. Your experience as an operator of gas works has been nothing?

A. I never operated a gas works.

Q. And you never constructed a gas works?

A. Never.

Mr. Burr: I believe he said the same about electric light companies also.

Mr. Mathewson: Yes.

Q. Now referring to page 34 of your report and the charge to depreciation of $3,424 for plant in 1905 do you mean to say that a similar amount or greater was not expended in new construction in 1905?

A. I did not.

Q. Well, if it was, then whatever depletion of plant arose, the $3,424 charged to depreciation would be replaced by the new expenditure to that extent, would it not, in order to bring the plant up to the same figure it stood originally?

A. What I did say was there was no identification between a particular article of plant, the new item which went in, and the depreciation of those old items.

Q. But that would not make any difference as to charging the $3,424 into depreciation and into operating expense?

A. None.

Q. And the same answer would be true of all the other items, pages 34 and 35, would it not?

A. Yes.

Q. Now, you have stated that in arriving at a proper charge for depreciation, as you term the account, it is necessary to take a term of years, is it not, in order to arrive at a fair average?

A. Yes.

Q. And if you were examining a gas property for an individual purchaser and found the amount charged for depreciation in the
last year very much smaller than the average for a larger term
4483 of years you would not think of advising the purchase, would
you, on the basis of the expenditure of the last year alone?

A. I would not.

Q. You would want to make an average?

A. I would.

Q. Now, when you say that this Exhibit B shows greater sales for certain months than the apparent make, you mean to say that the books of the company do not show what the explanation of that is so far as you have gone?

A. I do.

By Mr. **Burr**:

Q. You have had no opportunity of comparing renewals for instance as claimed by the Consolidated Gas Company to have been made for the past 22 years, to obtain any average, have you?

A. I have not.

Q. When you say that you understand that such accounts were kept with regard to stock and material as Mr. Mathewson has referred to, that was what you were informed by Mr. Carter?

A. Yes.

Q. Was the situation?

A. Yes.

Q. Of that you know nothing of your own knowledge?

A. Of my own knowledge I know nothing.

Q. And as a matter of fact you had a good deal of difficulty with regard to a considerable number of vouchers for material, didn't you?

A. I had.

Q. In ascertaining what disposition was made of the material represented by those vouchers?

A. Yes.

Q. And that as a matter of fact was the occasion for referring the matter to the Board of Advisory Engineers?

A. It was.

Q. And it was long after that that you discovered a separate set of books was kept in the stations?

A. Yes.

Q. Mr. Carter never gave you such information when you
4484 applied for information in regard to that, did he?

A. He did not.

By Mr. **Mathewson**:

Q. You did not know that the books of the several stations were produced before the Gas Commission and have been produced here?

A. I did not.

Q. You were not informed by your counsel or by your client or by anybody else?

A. I was not. I asked the question of the Secretary and he informed me there were no books.

Q. No books kept at the stations?

A. He did, that there was no account kept of the stock of material.

Q. At the general office, didn't he?

A. He did not qualify it.

By Mr. **Burr**:

Q. You asked for information on that subject and he told you that there was no account kept of it?

A. Exactly.

By Mr. **Mathewson**:

Q. You do not mean to say he told you there were no books kept at the several stations?

A. He said no account of what went into the repairs.

Q. You mean to say he told you there were no books kept at the several stations, account books?

A. He made the statement there was no note kept of that stock, which was the question I asked him.

Q. That was all?

A. Yes, and reiterated the statement.

By Mr. **Burr**:

4485 Q. And that was the reason for inspecting the plant for the purpose of ascertaining where this material went to?

A. Yes.

By Mr. **Mathewson**:

Q. And you were not informed by Doctor Marks, who was present all through the Gas Investigation, and with whom you consulted, that the station records of the Company did show those things and that they were put in evidence before the Gas Commission, were you?

A. I was not.

Q. And was not your talk with Mr. Carter with reference to the accounts at the general office?

A. With reference to all accounts.

Q. Now, as a matter of fact, referring to this renewal or depreciation account since 1884, you were at liberty to examine that if you had time, were you not? It was not denied you?

Mr. **Burr**: We are only permitted to examine for the year 1905.

A. My instructions were for the year 1905 and that I had no access to books of previous years.

Q. You did not know that the repairs and renewal accounts from 1884 down to date was subject to your inspection, and you were not informed by your counsel to that effect?

A. I was not.

Q. It was not denied you, was it?

A. I didn't ask for it.

Mr. **Burr**: Will you let us——

Mr. **Mathewson**: Wait a moment. I submit that I should get through with this matter first.

The **Master**: I am tired of this whole question of the refusal to

permit inspection of books and plant. I have nothing else but that reiterated for weeks and months and I do not like to waste any more time on it. Now let Mr. Mathewson finish his cross-examina-
4486 tion, and Mr. Burr may then redirect the witness on that point as long as he desires.

Mr. **Mathewson**: Your Honor will remember it was expressly provided and stipulated when we settled this that that account would be subject to inspection if they desired it.

The **Master**: I told the parties early in the sessions that they could have any books they wanted and if they did not get them I would see that they got them. That is the reason it is irritating to have so much time spent on the question as to what books have or have not been refused.

Mr. **Burr**: Do I understand that they had no objection to this account being examined?

Mr. **Mathewson**: I am not going to make any further statements. I have gone over and over the matter and got sick of having you state refusals were made when I know they were not made. If you read the record, I prefer to refer to that.

Mr. **Burr**: My recollection is that the Master said we would be confined to the year 1905, and later on if we could show there was any necessity for going further we could come in here and apply to him, particularly with reference to having another year examined with reference to 1905.

Mr. **Mathewson**: That is another proposition.

Mr. **Burr**: That is the way that matter has remained to the present time. I am through with this witness.

By the **Master**:

Q. I notice that in your report here you say in regard to
4487 Item 69, "Fixed Charges," that you have excluded that as not coming within the scope of your inquiry as to the cost of manufacturing and distributing gas. Will you just explain to me what you did consider the scope of your inquiry was?

A. It was to determine exactly what it cost to manufacture and distribute gas to the private consumer of New York.

Q. You mean in the abstract or what it cost this Company?

A. What is cost this Company.

Q. And, as I understand, then you took in no account of any question involving capital invested at all?

A. I did not.

Q. Not at any point?

A. Not at any point.

Q. As I understand, while you allowed certain taxes, you excluded all consideration of franchise taxes?

A. No, sir; I included franchise taxes at the amount they were assessed for the year 1905, $406,000, page 33 of the report.

Q. But the charges in connection with franchise litigation you did not include?

A. I did not include.

Q. And what is your theory about that?

A. The franchise litigations were in respect to litigations of past years.

Q. And, therefore, although paid in the year 1905, were not considered as part of the expenses of the company?

A. That's it.

Q. Then suppose the company litigated its franchise tax for 1905 and they did not pay the bills until 1907?

A. As a matter of fact, sir, I do not think the franchise tax or any expense in contesting it is a fair charge against the consumer. Assuming the rate of gas to be 80 cents or 90 cents, any saving would be to the benefit of the stockholder, not to the consumer.

4488 Q. Very possibly. But assuming that the franchise tax or some other tax was ordinarily litigated from year to year, if you selected any one year, for instance, like 1905, and did not make any allowance for litigation on that account, wouldn't you be rather underestimating the ordinary expenses of the company?

A. I do not think so. I do not consider franchise litigation normal expenses for this purpose.

Q. How long did you say you were working on this investigation?

A. I was at the office of the company between five and six weeks and another week in our own office preparing the report; between six and seven weeks.

Q. And did you start at work as soon as you were retained on behalf of the defendant?

A. The day we got instructions, yes, sir.

By Mr. Burr:

Q. And you worked night and day, didn't you?

A. Yes.

Q. And it took you all that time to examine the year 1905, Exhibit 94?

A. It did; and the real estate.

Q. Did you have time to do anything else but that during those six weeks that you have been actively employed with the shift of from twenty-three to thirty-three men?

A. By working longer hours I might have done a little more.

Q. As a result of that continued examination you arrived at some conclusions, did you not, with regard to the necessity of further examination of some items for the purpose of testing those items as they appear in the books for the year 1905?

A. I do not follow you.

4489 Q. I say, as the result of the examination of the books for 1905, did you not, as a matter of fact, arrive at some conclusions with regard to the necessity for examining certain accounts in the books for previous years, for the purpose of testing the accuracy of those same accounts as they appear in this year, 1905?

A. I did.

Q. Particularly with reference to the oil and renewals?

A. Yes.

Q. And do you still think it absolutely essential to a correct and thorough understanding of these accounts that a comparison should be made of those accounts in the books of other years?

A. I do.

Q. Of some other year?

A. I do.

Mr. Burr: We now ask you to consent, in view of this, which I reserved until this time, to a comparison and examination of the books of the Consolidated for some year since 1900, for the purpose of testing the oil account, and for the right to examine the books for the past fifteen years to ascertain the exact condition of the renewals account.

(No response from counsel for the complainant.)

Mr. Burr: I make that application to the Master. We are ready to proceed at once to carry out that——

The Master: Specify the books.

Q. In what books would the oil account be kept, Mr. Hall, for the past years?

A. Operating ledgers in the general office; manufacturing records.

Q. What books would the renewals account be kept in?

A. Operating ledger.

Q. So that if you had the operating ledger for say the year 1902 you could obtain all the information you desired with regard to the oil contracts and the oil supplied and used by the company during that year?

A. With the assistance of the subsidiary books.

4490 Q. What books would those be?

A. Manufacturing records.

Q. Those manufacturing record- woulds consist of what books?

A. The five stations, showing the manufacturing records, the averages, the quantities they buy and the Beaume test and so on.

Q. Showing the amount of oil and the kind of oil used in the manufacture of the gas?

A. Yes.

Q. What book or books would the renewals appear in?

A. Operating ledgers.

Q. That would also apply to the subsidiary books?

A. Yes.

Q. What books would those be?

A. General books and vouchers.

By the Master:

Q. How long would it take to make this examination?

A. Renewals and repairs for fifteen years, and one year of oil?

Mr. Mathewson: Repairs and renewals for twenty years. If anything, take the whole period. Depreciation account I suppose you refer to.

The Witness: From ten days to a fortnight.

The Master: Then it is useless to pass upon it. Defendant's time expires on Monday. I shall not certify any more unless you can get all counsel to stipulate to withdraw all the other witnesses and to devote the rest of your time to this matter so as to finish up on Monday. The application is merely academic as far as I am concerned.

By Mr. Burr:

Q. You could finish the examination of the oil account by 4491 the end of the week, couldn't you?

A. Yes. And to a certain extent the repairs and renewals by the end of the week; we could do something by the end of the week.

Mr. Mathewson: If the Master please, the matter of oil is as to what we are paying for oil. It is what we are paying. It has been suggested we ought not pay so much. That is another proposition. It is not what we paid for oil in 1903 or 1904, or what we could get oil for then. It is what we have to pay for it now, and the idea of examining in 1902 the oil account to know what we have got to pay for oil now is ridiculous.

The Master: It seems hardly worth while to discuss it in view of the situation the case is in. I assume that counsel have got all that they can do to get through with the witnesses they have on hand, and it certainly seems a useless waste of time and money to start in on a further examination of these voluminous books without any prospect that there will be any opportunity for the witness to come and give the results of his examination.

Mr. Burr: He says he believes he could have his report on the question of oil ready and be able to testify regarding it on Monday—have it ready by the end of the week and be ready to testify on Monday. It would be very short. And probably something on the question of renewals he would have by Monday and be able to testify regarding.

The Master: Will you and counsel for the State unite in a stipulation on the record that the case shall be closed in all respects this week and nothing left but to take up this witness and that 4492 will close the cases of both defendants?

Mr. Burr: I understood we had even under the limitation in your certificate until Monday, didn't we?

The Master: Yes.

Mr. Burr: I say if his report is in to me on Saturday and he is ready to testify on Monday I do not think we should stipulate that we shall close the case as a condition for allowing him to testify Monday.

The Master: But I assume the counsel for the State may very possibly, if you have other witnesses, or the State has other witnesses, raise objection to your taking up this witness on Monday with an unfinished witness on the stand left over from this week, provided you understood you were absolutely to close your case on Monday.

Mr. Burr: Well, we will see what can be done in that regard?

The Master: You had better consider it and if there is any prospect of the evidence resulting being used I shall grant the application. If there is not I think it is hardly worth while to waste time over it.

Mr. Mathewson: But certainly there would be no sense in going back to 1902 in any event, as to oil.

The Master: I should have to look into it far enough to be satisfied of its materiality.

Mr. Mathewson: Everybody knows oil is going up. Ten years ago you could buy naphtha for what we could buy only half that grade of oil now.

Mr. Burr: In view of the statement of counsel for com-
4493 plainant we have strong reason to believe that the amount
paid for oil is excessive and that the Consolidated are in receipt of a rebate from the Standard Oil Company, and that is what we want to have a comparison for.

Mr. Mathewson: I think we went over that very thoroughly with Mr. Cuthbert. He went into all that.

Mr. Burr: I would not have alluded to it again if you had not made your little speech.

Mr. Mathewson: You may repeat it all you desire, Mr. Burr.

Charles F. Lacombe recalled on behalf of the city.

Direct examination by Mr. Burr:

Q. During the progress of this examination of the books by the accountants, Marwick, Mitchell & Company, you, I believe, acted as chairman of the Board of Advisory Engineers, composed of yourself, Dr. Marks, and Mr. Edgerton?

A. Yes, sir.

Q. And the purpose of that organization was to aid the accountants, I understand?

A. Yes, sir; purely.

Q. You kept records of the proceedings of the various meetings that you held?

A. Yes, certainly. We kept minutes clear through.

Q. And you were in constant communication with the accountants, were you?

A. Yes.

Q. Do you recall what matters were submitted by the accountants, to you, for your consideration, growing out of their examination of the books?

A. Well, a very large number of detailed items going into very
nearly everything, operating, construction, stoves, meters, and
4494 what the Consolidated Gas Company calls distribution ac-
counts. Those were the principal items that I remember.

Q. Now, will you take them up in their order as they were passed upon by you and tell us what you did or what the Board did?

Mr. Mathewson: Is that material?

The Witness: May I have the minutes to refresh my memory with?

Mr. Burr: Yes, here they are.

Mr. Mathewson: I object to it on this ground: it appears from the witness' qualification and his previous testimony that he is not an expert in the gas business, has never managed a gas business, never constructed a gas plant, he is not practically familiar with the business, and he is not competent, according to my view, which in this instance concurs with that of Dr. Marks, to testify on this subject.

The **Master**: Well, I think in view of Mr. Lacombe's official position and experience here that his testimony can be regarded as competent on the general subject, but the question is objectionable in the form in which it is put. It is certainly not material to bring out by this witness the action of a so-called Board of Advisory Engineers or have him describe what they did. What I will allow is for you to take up the various questions that were raised and you can ask him, taking up those questions, I say, what his opinion is, based on his knowledge and experience as to the matters involved, but that is entirely irrespective of any action of the Board. That is not evidence for any purpose. You can take this up just as new matter, these various questions that were suggested there, and ask him what 4495 his opinion is as an engineer on those subjects, based on his knowledge and experience. That is all you are entitled to.

Mr. **Burr**: I wanted to first show just exactly what the situation was, it being desirous of having an honest and accurate account for the year 1905, that we did everything possible to aid the accountants to arrive at that conclusion, and that this Board of Advisory Engineers was organized for the purpose of helping them out wherever any matter relating to the practical operation of the gas works arose, with regard to which the accountants themselves needed advice or were at all in doubt. It does seem from their report, and Mr. Hall has testified, that various matters were referred to the engineers, and you have stricken out or refused to allow the report so far as it refers to the action taken by the Board of Advisory Engineers. I am now producing Mr. Lacombe, the Chairman of that Board, to state what action was taken with regard to these various disputed items.

The **Master**: I understand you are and I have ruled it is not competent in that form.

Mr. **Burr**: He can state what action he took upon the matters referred to by the accountants.

The **Master**: I do not care what action he took at all. His action is not material. You can ask him, as I say, his opinion as to the various questions involving expert knowledge or experience.

Mr. **Mathewson**: To shorten this, after looking it over, I do not know that I should object to the marking in of these reports, assuming that Mr. Lacombe says they are statements of actual pro- 4496 ceedings, as I assume he will; and that they represent what was done, if that meets Mr. Burr's views.

The **Master**: It will certainly save a great deal of time.

Mr. **Burr**: Yes, that is satisfactory.

Mr. **Mathewson**: That would not be admitting the weight which would be given to the advice of these gentlemen, but that they gave it.

The **Master**: Of course, you take the chance of their not all being produced here for cross-examination.

Mr. **Mathewson**: Yes, I know I take that chance.

Mr. **Burr**: Then I understand the objection is withdrawn as to the introduction of those minutes?

Mr. **Mathewson**: Yes.

Mr. **Burr**: So the stenographer, instead of marking that as that Exhibit A, minutes of the Board of Advisory Engineers, that Exhibit A is to be printed with the rest.

Mr. **Mathewson**: As to the action of the Board without, as I said, admitting the weight that would be attached to these.

The **Master**: That being done, the references in the body of the report to the action of the Board might be still allowed to stand and the report considered as in.

Mr. **Burr**: The statements in the body of the report are to the effect that these matters were referred to the Board of Advisory Engineers and these minutes show what action was taken upon those matters.

Mr. **Mathewson**: Very good.

Mr. **Burr**: Then I will ask Mr. Lacombe this one question, whether these various schedules that are attached to the report, 4497 particularly schedule E, were not necessary in helping you arrive at the conclusion which you did.

A. Well, this particular schedule was not. It was not referred to. There were schedules.

Q. You consulted the schedules that were prepared by the accountants, did you not?

A. Only such as they submitted to us.

Mr. **Burr**: Well, whatever they were. Now I have no other witnesses here. Of course I assumed we would go on with Mr. Lacombe now. I will tell you what I propose to do and consult with my friend Kirby and find out what he is able to do this afternoon. We will be ready to testify to-morrow morning with regard to the examination of the 14th Street plant. That is, I will be able to give testimony with regard to the valuation of the 14th Street plant, so that you may have your people here for that purpose, Mr. Mathewson, to-morrow.

Mr. **Mathewson**: What goes on this afternoon?

Mr. **Burr**: I do not know now.

At 12:38 P. M. no other witness being present, an adjournment was taken to 2 P. M.

4498

After Recess.

Mr. Page also present at afternoon session.

Mr. **Burr**: I desire to recall Mr. McHale for the purpose of testifying as to Block 989, page 2 of Exhibit 48. The city claims that by reason of the deeds and grants heretofore introduced in evidence the complainant has no title to a certain portion of that block.

MARTIN MCHALE, recalled on behalf of the City.

Direct examination by Mr. BURR:

Mr. MATHEWSON: You refer to the water grants which have been put in here recently?

Mr. BURR: Yes. A map is being prepared showing exactly the situation as we claim it exists by reason of these grants.

Mr. MATHEWSON: Showing no title to which block?

Mr. BURR: 989.

Mr. MATHEWSON: You mean Block 989, Lot 26?

The WITNESS: This is the property right here, indicating on Exhibit 48, page 2.

Mr. BURR: A copy of the water grants and maps are being prepared by Engineer Waters and we will present them later on. Meanwhile I want to use Mr. McHale's diagram, and ask him what change he desires to make in his testimony, if any, with regard to the valuation of that plot, assuming that this red line marked on this diagram, running through Block 989, shows that the Consolidated Gas Company does not own the section of that block embraced between the red line extending from 15th to 16th Street, and to the east of that line. 4499

A. I wish to change my valuation from $105,032.63 to $36,463.28.

Mr. BURR: I will ask to have this diagram marked for identification. When we have a copy of the original map presented by the engineer, it may be seen whether this shows the situation correctly or not.

Marked for identification, City's Exhibit 88.

By Mr. MATHEWSON:

Q. That is on the assumption that the company owns what is south of the red line?

A. Yes, sir.

Mr. BURR: South and west.

The WITNESS: On the assumption that the company does not own on the north of the red line.

By Mr. BURR:

Q. And the difference, then, is to be subtracted from the total valuation which you find as the valuation of the real estate?

Mr. MATHEWSON: It is not unless the Master finds we have not any title to the land. He has already testified that would be the difference, assuming that we do not own it.

Q. There is another correction I believe you wish to make as regards the valuation of some plot?

A. Yes, I made a mistake of $115,200 in Block 1704.

Q. That is your testimony as it appears upon page 2803 of the record?

A. Yes. My original figures on that property were $281,584. There was a mistake made in addition. It should be $396,784.

4500 Cross-examination by Mr. **Mathewson**:

Q. Then the net result would be to increase your total by an amount equal to the differences between this last amount——

A. There is a mistake of $115,200, to increase my total.

Q. That would be an increase of your total?

A. No, sir.

John M. Thompson recalled on behalf of the City.

Direct examination by Mr. **Burr**:

Q. You have already testified with regard to the valuation of Block 989, as the same appears on Complainant's Exhibit 48, page 2.

A. Yes, sir.

Q. Assuming that the diagram marked for identification, City's Exhibit 88, correctly shows the situation as to the title and ownership of the parcel by the Consolidated Gas Company, what change, if any, would that make in your valuation?

A. I should think that that property there is worth——

By Mr. **Mathewson**:

Q. Do you mean Block 989, Lot 26?

A. Yes, sir, Block 989, part of lot 26, I should think that to be worth $34,270.

By Mr. **Burr**:

Q. Instead of?

A. Instead of $99,530.85.

Q. Do you wish to make any correction further than that in your previous valuation?

A. Not any change in the valuation but there is an error in addition in Block 1704.

4501 Q. What is the correct amount?

A. The correct addition is $396,784 instead of $281,584.

Q. As appears in your former testimony?

A. Yes, sir.

Q. On page 2803 of the record?

A. Yes, sir.

Cross-examination by Mr. **Mathewson**:

Q. That would make an increase in your total then of $115,000 and odd more than as you originally testified?

A. $115,200.

Mr. **Burr**: That is all the testimony I have to-day. I will have the engineers to testify as to the values of the plants to-morrow.

Charles D. Chamberlain, a witness, called on behalf of the State, being first duly sworn, testified as follows:

Direct-examination by Mr. Page:

Q. Where do you reside?

A. Cleveland, Ohio.

Q. What is your occupation?

A. I am Secretary and Treasurer and General Manager of the Globe Oil Company of Cleveland, Ohio.

Q. What is the business of the Globe Oil Company?

A. The manufacture and dealing in different kind of petroleum and its products; other oils.

Q. Do you manufacture and sell, or does the Globe Oil Company manufacture and sell, what is known as gas oil?

A. Yes, sir.

Q. What is gas oil, as distinguished from any other sort of oil?

A. Gas oil is the term that we apply to oil that is used for enriching coal gas by gas plants, and is not a distinction of absolute quality for differentiation because the gas oil can be a higher or lower gravity, according to the facilities that the gas companies
4502 have for vaporizing the oil or gasifying the oil and rendering it into a fixed gas. And gas naphtha is sometimes used for designating the higher grades such as 54 to 63 gravity, and then gas oil usually runs from 34 to 36 gravity, but it is a distillate oil. That is, a product of the still. Some gas companies can use a lower gravity oil, in which case we sell crude or residual oils of 28 to 30 or 32 gravity.

Q. Well, 28 gravity oil, do I understand then, is practically a crude oil?

A. Crude oil or a residual oil from which the lighter portions of the crude have been taken.

Q. Now, in the oil fields of Ohio and Pennsylvania do they produce a 28 gravity oil?

A. You mean as a crude oil?

Q. Yes?

A. No. The gravity runs lower in Ohio than it does in Pennsylvania. The gravity in Ohio runs from 34 to 38, sometimes as high as 39 in its crude state, and in Pennsylvania the average gravity is about 45, running from 41 to as high as 47.

Q. From what section of the country is the crude oil of 28 degree gravity obtained?

A. There is some 28 degree gravity crude oil obtained in Kansas, Indian Territory and some from some parts of Texas. I give this on information.

Q. Then as I understand, the 28 degree oil except such as may come from the Texas, Kansas or Indian Territory fields is residual oil after the lighter oils have been distilled?

A. Yes, sir, generally.

Q. Now, is the 34 degree oil a residual oil?

A. No, the 34 degree is a distillate oil.

Q. Well, if you take the Pennsylvania oils that run so much lighter and distil from that the lighter portions, you then obtain a 34 degree oil that they would sell in this way?

A. No, the Pennsylvania crude is of too high values to 4503 sell the residual portions in that way. They would obtain a 34 degree distillate oil of little value from the distillation of Pennsylvania oils, but I would not have in mind any case where they would make a residual oil of the Pennsylvania products.

Q. Are you familiar with the prices at which oil is sold?

A. In a general way, yes, sir.

Q. Are you familiar with the prices at which oil is sold for export?

A. Yes, sir.

Q. What gravity oil is exported?

Mr. Mathewson: From Ohio or Pennsylvania? What do you mean, abroad?

Mr. Page: I mean export, exported from this country.

The Witness: Yes, it is 44½ gravity usually and what is known as 73 Able test or Standard white.

Q. That is a refined oil?

A. Yes, sir.

Q. At what price does that oil sell in large quantities for export?

A. To-day's quotation is 4.40 in New York, 4.35 in Philadelphia.

Q. That is 4.40 cents per gallon?

A. Yes, 4.40 per gallon.

Q. Do you know how that price corresponds with the price for the last year?

A. It is very nearly the average of the last year as I remember the quotations.

Q. You think there has been very little fluctuation?

A. Very little. I presume it has been as high as 4¾ within the year; I would not say absolutely, but it has run within the year, well about four—well, I guess, 4.65 is the highest I remember its having reached, and from that down to 4.35, that is about the lowest.

Q. Well, for gas making purposes, oil of 44½ degrees would produce better results, there would be less residual and more il- 4504 luminant obtained than from the lower gravity oil?

Mr. Mathewson: Is Mr. Chamberlain in the gas business also?

Mr. Page: No, he is in the oil business.

Q. Well, of course, I know that the higher gravity oil is more easily volatilized; I have — shown that in talking with gas men with whom I have been dealing.

By Mr. Mathewson:

Q. But you never had experience yourself in the use of oil in gas making?

A. No.

By Mr. Page:

Q. It is your experience that you have acquired in selling oil to gas men?

A. Yes, sir.

Q. And you are familiar with the fact that at first the very highest, naphtha was the oil that was used in making gas?

A. Yes, I have sold a great deal of naphtha for gas making.

Q. Until that became so expensive that they could not use it?

A. Yes.

Q. And that the higher degree, that is, naphtha, which was a very high degree, was the best for gas making purposes.

Mr. MATHEWSON: Just a moment. The witness said he sold it for that purpose. It does not seem to me he can testify it was the best, if he has not had experience in the gas making business. It would depend upon candle-power and one thing and another.

Mr. PAGE: It has been testified in this case that the best gas was made from naphtha, but it could not be used now on account of the price.

4505 Mr. MATHEWSON: No, he said he sold it for gas making, and it was the best because it was easily volatilized.

Mr. PAGE: I will not press it.

Q. What is the price of 34 degree Beaume oil?

A. The last that I sold I sold at 3.15 cents delivered, about twenty-five miles from the point of shipment; I think the rate of freight was about five cents a hundred pounds.

Q. What would be the price free on board at Cleveland?

A. It would be about three cents there.

Q. Are you familiar with the freight rates from Cleveland to New York?

A. The present rate——

Q. On oil I mean.

A. On oil, as I remember, it is twenty and one-half cents; the point of shipment was Findlay, Ohio, however, and the rate from there is 22 cents.

Q. 22 cents on what?

A. On 100 pounds.

Q. Can you get that in any way reduced to gallons?

A. Yes. A 50-gallon barrel would weigh 325 pounds. It would be a little over a cent and a quarter a gallon.

Q. As I understand, that is the freight rate of freight shipments as charged by the railroad companies to the independent refiners?

A. Yes, sir.

Q. And has nothing to do with the rates that may be charged to the Standard Oil?

A. No.

Q. And it does not take into consideration delivery by pipe line?

A. No.

Q. And delivery by pipe line is much cheaper than delivery by railroad?

A. Yes, sir.

Q. Do you know the price of 28 gravity oil?

A. 28 gravity oil would be about a quarter of a cent cheaper than 34 gravity.

Q. How do the prices that you have given for 34 and 28 degree gravity oil correspond with the prices during the last year?

4506 A. They are slightly higher than they have been heretofore by perhaps a half a cent a gallon, taking the lowest market price within the last year, it would be fully half a cent, perhaps five-eighths of a cent more than the prices I have given now.

Q. Have you had read to you the contract between the Consolidated Gas Company and the Standard Oil Company which appears on page 977 of the printed record in this case?

A. Yes, sir.

Mr. MATHEWSON: Which is that, the present contract?

Mr. PAGE: The 255,000,000 gallon contract.

Mr. MATHEWSON: Can you give me the date of that?

Mr. PAGE: The contract was dated November 1st, 1905, that is the one in existence now.

Q. And have the prices that you have given for 34 degree Beaume and 28 degree Beaume oil been for similar oil as described in this contract?

A. Well I presume so. What is known as 34 degree gravity distillate gas oil is I think commercially recognized to be about the same by all companies. The 28 degree I am not certain as to what it might be. It might be Texas, it might be heavy residual oil made from any of the other crudes and it might be a distillate oil from the Texas crude, so I would not be certain about that.

Q. To be positive I suppose it would be necessary for a person familiar with oil to have a sample of the oil which this Company is now using?

A. Yes, it would be desirable to have a sample of both, before being absolutely certain as to what they are.

Q. Well the price that you have given would be an oil which would answer this description as specified in the contract: "The gas oil we expect to furnish will be homogenous oil and of a gravity as agreed upon," that is 34 and 28 degree? 4507

A. Yes, and homogenous there, I suppose, refers to the fact that it is not a mixed oil, that is, it is not an oil of higher and lower gravities united for the purpose of obtaining 34 degree, but cut out of the still at very near 34 degree gravity; within one or two degrees each way; because if it were a mixed oil and not homogenous, the lighter portions would vaporize and leave too much of a residual and it would interfere with the distillation of it.

Cross-examination by Mr. MATHEWSON:

Q. How long have you been in the oil business, Mr. Chamberlain?

A. About 22 years.

Q. All the time in Ohio?

A. Yes.

Q. You have never been engaged in the gas business?

A. No, sir.

Q. Does your company own oil wells?

A. No, sir. That is, the Globe Oil Company does not. I am interested in a company that does.

Q. From what section does the oil come in which you deal?

A. It comes from various sections; we buy oil from the Pennsylvania districts, some comes from Southern Ohio, and some comes from the Findlay districts.

Q. Do you deal with the Standard Oil Company?

A. No, sir.

Q. I observed in the press the other day that the Government suit in St. Louis against the Standard Oil Company recites that 90 per cent. of the oil in the United States is owned or controlled by the Standard Oil Company. Is that about right?

A. I don't know that that is the statement that is made.

Q. I so read it, and I ask you whether that is about right?

A. If you are referring to the producing of oil, I should
4508 say no. If you refer to the manufacture and sale of oil, I
should say that it was very nearly; perhaps a trifle high; perhaps 85 would be nearer; however, I would not be able to give any figures to substantiate it.

Q. If the officers of the Government preliminary to this suit in St. Louis made a careful investigation and make that assertion in their papers, that would be entitled to considerable weight, would it not?

A. I should give it credence, yes, sir.

Q. Now, you do not mean to say that all gas oil can be economically converted into a fixed gas, do you?

A. All gas oil?

Q. Yes, can be economically converted into a fixed gas?

A. Now, you refer to the different quantities or grades of gas oil?

Q. Yes?

A. I would not think that they could all be equally economically converted.

Q. Is crude oil used for gas making?

A. Yes, sir, very largely.

Q. In the west?

A. Yes, sir.

Q. You do not know of any place in the East where high candle power is required, where crude oil is used in gas making, do you?

A. I am not familiar with any, no, sir.

Q. Do you know what quality of oil is exported for gas making?

A. I do not. I don't know anything about the export of oil for gas making purposes.

Q. It is a matter of common knowledge, is it not, that various manufactured products are sold abroad, in some cases at lower figures than they can be produced in America?

A. I have heard of those things, yes, sir.

Q. You have no doubt about it, have you?

A. I have no doubt about it.

Q. On what railroads are the freight rates 22 cents per 100 pounds from Findlay to New York?

4509 A. I spoke of that rate, I think it is all on the trunk line roads.

Q. That includes the entire freight from point of production?

A. Yes.

Q. Or the rate from Cleveland only?

A. No, from Findlay, that is my remembrance of it.

Q. You speak of the delivery of oil by pipe line being much cheaper. It is not your experience, is it, that the seller of any commodity, no matter what his facilities for transportation are, sells for a lower figure than he can dispose of this product and get a good profit?

A. He generally tries to get the highest market price.

Q. Do you know anything about the harbor delivery and storage, and how that affects the ultimate cost of delivery by pipe line as compared with freight?

A. I don't know just what you are getting at. Do you mean the lighterage charges across the bay?

Q. Yes, and the storage charges on oil pipes up, so to speak, at a terminal by pipe line?

A. I don't know what they are, no, sir.

Q. Have you ever bought oil in the City of New York?

A. No, sir.

Q. Referring to the contract of November 1st, 1905, between the Consolidated Gas Company and the Standard Oil Company to which your attention has been drawn, it provides, you observe, for the delivery of 255,000,000 gallons of oil. That is a very large order, is it not?

A. Yes, sir.

Q. How long a period is that?

A. I did not notice.

Q. Two years and eight months?

A. Yes, it would be about 2,000,000 barrels a year.

Q. That is a larger order than your company ever filled, is it not?

A. Yes, sir.

Q. This contract also calls for homogenous oil as you indicated. If you had to provide homogenous oil of the character you 4510 have described instead of oil of the same degree of test obtained by mingling other oils at your own convenience you would expect that a somewhat higher charge would be made for it, would you not?

A. Oh, no, I do not think so. In the higher oils there is very little danger of their mixing anything higher than that because the higher oils would go into the water white or prime white.

Q. Anything higher than which, the 28 or 34?

A. No, anything higher than would make homogenous oil at 34; say it would run down to about 41 or 42, and would go into prime white oil and then from that on down to 31, would average perhaps about 34, 34 to 35 gravity.

Q. And you observe that 40 per cent. of this 255,000,000 gallons must be 34 degrees Beaume?

A. Yes.

Q. And only 60 per cent. 28 degree and you observed the 34 degree is to be delivered exclusively during the months of November, December, January, February and March of each year and the 28 degree gravity during the months of March, April, May, June, July, August, September, October and November of each year?

A. I did not notice that.

Q. Look at it (handing book) and see if it does not say so, is that correct?

A. Yes.

Q. It would take very large distilling facilities, would it not, to provide for that contract?

A. Yes, sir.

Q. And would not the fact that all of this high grade oil has to be delivered within these few months in the winter, and perhaps accumulated and stored for that purpose, tend to make the contract more onerous on the contracting party, the Standard Oil Company?

A. Well, it is rather more advantageous to the parties delivering, because it would be taken during the time when the most refined oil is marketed, that is, during the winter. It is more advantageous to deliver that oil in the winter than in the summer. 4511

Q. But do you know what the expenses for storage are? I think you said you did not?

A. Not in the harbor, no, sir. The expense of storage at the refinery, of course, would be the interest on the investment, that is practically all.

Q. It would make a difference to the purchaser of the oil, whether the company which was to deliver it, had very large storage facilities, would it not?

A. They would have to rely upon the fulfillment of the contract, yes, sir.

Q. And especially if they only had 24 or 48 hours' supply on hand which the consumer must himself *could* provide for?

A. He would have to provide to protect his contract, of course.

Q. Do you know of any other independent producer as distinguished from the Standard Oil Company and the company which it controls which has ever undertaken to fill an order for 255,000,000 gallons of these gravities within this period?

A. I could not state, no, sir.

Q. You have never known of such a case?

A. No, sir, not that I can testify to.

Q. Do you contend that kerosene oil, as used in lamps and the like, is more economical as to gas making than gas oil made from Pennsylvania or Ohio oils?

A. Well, on that question I don't know that I can testify, not being a gas maker; but I know that gas companies have preferred in buying to get the lighter gravity oil.

Q. Will you define the term of residual oil as you used it?

A. Yes, it is the oil that is left in the still after distillation.

Q. The freight rate to which you have referred would be merely to the harbor line of New York, would it not? In other words, it would not carry the oil into the tank of the gas company in New York? 4512

A. No.

Q. And whatever additional charges there would be in that connection, you do not know personally?

A. I know that there is a lighterage charge of three cents usually exacted in New York harbor on delivery to the New York side, that is, New York proper; but I don't know anything about the facilities for receiving the oil after it is delivered here; I don't know anything about that.

Q. Do you know what per cents. would be distilled at the several distillation temperatures?

A. I am not familiar with the making of gas, no, sir.

Q. When you speak of what is left in the still, you mean final distillation?

A. No, distillation down to the point of 28 gravity in the still. That would be partial distillation, taking off the benzine and the lighter oil, the water white oil. Of course final distillation leaves nothing but coke in the still.

Q. How much oil does the Globe Company sell per annum of 34 degree Bea*mue* homogenous?

A. I cannot tell you.

Q. Well how much of 28 degree homogen-ous?

A. I cannot tell you that, either, not now. I can send it to you if necessary.

Q. Can you not state approximately?

A. No, I don't think I could. I haven't it in mind. I have not kept track of it. It is not our principal business.

Q. Would it be 100,000,000 gallons?

A. No.

Q. Would it be 50,000,000 gallons of 34?

A. No.

Q. Would it be 25,000,000 gallons of 34 homogenous in a year?

A. No, I don't think so.

Q. And you cannot be any more definite in regard to 28 degree?

A. No.

Q. Do you sell more 28 degree or 34 degree?

A. I think more 28.

4513 Q. Do you insert in your contracts the word homogen-ous in selling oil usually?

A. We usually comply with the specifications; if they are in the specifications of the gas company of course it is inserted.

Q. If they are not in the specifications of the gas company you never suggest homogenous, do you?

A. It would not be to our advantage anyhow.

Mr. Mathewson: That is all.

Mr. Page: Now, if the Master please, we have a witness and he can answer a great many of Mr. Mathewson's questions, but it is necessary, as has been shown by this witness, for us to have a sample of their oil of the 34 and 28 degree, and I would make an application for a quart of each for which we will pay at the current rate described in this contract, which is higher than we could buy it in the market probably, but nevertheless we will pay it. And to be sure, we would like to help draw it. Have you any objection to that Mr. Mathewson?

Mr. Mathewson: I do not think that I am called upon to say anything about that subject. We have contracted for 34 degree oil, if we do not get it, we are getting cheated. What we contracted for was 34 and 28 degree oil, and if it appears that it is something else, which I have no notion it would be, we would simply have an action for damages, perhaps. I do not see how it affects this case.

Mr. PAGE: Brother Mathewson knowns that I do not have any desire to affect the very pleasant and cordial relations existing between the Consolidated Gas Company and the Standard Oil Company, and I would hate to throw a firebrand which would in any way affect those relations. But the purpose is entirely different; it is not to help them in any suit for damages but it is to enable us to ascertain the exact quality of oil they are using so that another witness can go on the stand and say what he would furnish that identical oil for, and that is what I will do if they give me that information. 4514

The MASTER: That is a matter for you and Mr. Mathewsen to arrange by stipulation, if possible; if not, by application to the Court. I do not know that I have any power to compel them to furnish you with oil any more than I would permit the inspection of the plants. The books and papers are a different matter. The two quarts of oil I think are *ultra vires* as far as I am concerned.

Mr. PAGE: Mr. Burr suggests that we already have the right to inspect the plant and the supplies on hand and this is part of the supplies on hand, but I prefer to inspect it by the way of experts. As I understand, then Mr. Mathewson refuses to let us have the sample.

Mr. MATHEWSON: Senator, don't understand so much as that, but this proposition is one which I would like to consider a little, and it seems to me it is wholly immaterial. I cannot see the bearing on the case, provided you should get your sample and you should prove we are being cheated in the oil we are getting.

Mr. PAGE: But I might show that this contract, and which is probably the fact, is a hokus pokus contract with a higher price named than you are paying, and that everybody else can get it at a lower price than you are paying.

Mr. MATHEWSON: There is the contract for certain oil. The question of whether it is a provident contract or not or whether it should be set aside——

4515 Mr. PAGE: But the City and State have a right, in fixing the price which you shall charge for your product, to hold you to paying no more than the market rate for your material, and this contract you know is the result of one which was cancelled, having a large portion of it still undelivered and having a higher rate fixed; whether for the purposes of this case or not, I *no* not know.

Mr. MATHEWSON: It appears in the evidence that that was delivered currently, and that we could not call for the required gravity under the old contract in the winter.

The MASTER: Is there anything further with this witness?

Mr. PAGE: As I understand, the Master's ruling is that he has no power to grant that.

The MASTER: I have no power to compel them to do it if they do not want to.

Mr. **Page**: I do not suppose the Court would have any more power than you have.

The **Master**: Well, the Court might take the power, whether it has it or not. The Court could lock a man up for non-compliance with his order, and I cannot without application to the Court, so that is the distinction.

Mr. **Burr**: Will they produce a barrel of oil in response to a subpœna *duces tecum?*

Mr. **Mathewson**: How much would you pay us for the oil that you want for a sample per gallon?

Mr. **Page**: We have offered to pay the contract rate.

Mr. **Mathewson**: We would expect to make a profit.

4516 **Emerson McMillen**, recalled as a witness in behalf of the defendant, the State of New York, testified as follows:

Direct examination by Mr. **Kirby**:

Q. Mr. McMillan, you have already testified as a witness in this case, have you not?

A. Yes, sir.

Q. I believe you are President of the American Light and Traction Company, are you not?

A. Yes, sir.

Q. And does this company control the gas companies operating in Milwaukee, Detroit and Grand Rapids, Michigan?

A. Yes, sir.

Q. Is it the fact that in the City of Milwaukee such gas company furnishes a yearly output of gas of 2,142,397,000 cubic feet and sells 2,010,016,000 cubic feet, is that the fact?

A. That is about the figure.

Q. What is the average price such company receives for its gas?

Mr. **Mathewson**: I object to that. It seems to me that is no criterion of what gas can be produced for here. Testimony of the same sort was offered before the Gas Commission, and even they excluded it as being without value. Conditions are different, materials are different, the cost of labor likely is quite different.

The **Master**: That is all so, Mr. Mathewson, but we have taken a great deal of testimony in one form or another involving the conditions of the gas business in other cities, and of course everybody realizes that the conditions in those two places are the same, and that this may raise a lot of collateral issues, but, however, I think all the testimony ought to be regarded as some value, and I will take it and give you an exception.

Mr. **Mathewson**: Exception.

4517 A. I will have to look at my figures to get the exact amount. I think I have got them here (referring to paper) for the twelve months ending October 31st, the average price was 85.44 cents.

Q. You have a certain price there for the first one thousand feet used in any one month, haven't you?

A. Yes, sir. The price prevailing at present and the price prevailing for some years was and is $1.00 for the first one thousand feet; 90 cents per thousand feet for the next 25,000 feet and all over the twenty-sixth thousand feet, 80 cents, for the gas consumed in any one month through one meter.

Q. That is for illuminating purposes?

A. That is for illumination. And for fuel, the first ten thousand feet was and is 80 cents a thousand; the second ten thousand feet 70 cents a thousand and all over twenty thousand feet is 60 cents per thousand feet. Now, the average of those for the twelve months ending October 31st, was 85.44 cents per thousand feet.

Q. Have you made any reduction in price in Milwaukee, the same to go into effect after January 1st, 1907?

A. We have.

Q. What are such prices to be after January 1st, 1907?

A. The prices which have been officially fixed by the Board of Directors and announced to the public is that gas used for any and all purposes for the first ten thousand feet will be 80 cents; the second ten thousand feet 70 cents, and all over twenty thousand feet 60 cents, from and after January 1st.

Q. If these prices had been in use for the twelve months ending October 31st, 1906, what would the average price have been during those past twelve months?

A. 77½ cents.

Q. Did the prices in use up to November 1st, 1906, give you a satisfactory return upon your capital invested?

4518 Mr. Mathewson: Is not that a little bit extreme? I think I shall object to that.

The Master: I think that is a little objectionable, as to form.

Mr. Page: The Master recalls that this witness was called as an expert as to what was a satisfactory return, by the complainant.

The Master: Hardly satisfactory, was it?

Mr. Page: What he should expect to get.

The Master: What the market conditions were, as respects gas securities and what investors required as a return. I think you could show the same thing as regards this company and how its securities sold and were disposed of and on what basis.

Mr. Page: It was not on that theory that they offered it at all.

Mr. Mathewson: The earning power of capital invested.

The Master: Ask him what the return was. You can get it in that way.

The Witness: Then he objects.

Q. Was the reduction which your company has made and which goes into effect on January 1st, 1907, a voluntary reduction on your part?

A. Yes, sir.

Q. Now, one of your companies sells gas in the City of Detroit, doesn't it?

A. Yes.

Q. Can you tell us the number of thousand cubic feet of gas made and sold in Detroit by your company?

A. During the twelve months ending October 31st, it made 2,288,447,700 feet and it sold 2,121,765,300 feet.

Q. What was the average price which you received for the gas sold?

A. 81.66 cents.

Q. And the candle-power of that gas was what?

A. The average was 18.2.

4519 Q. And what was the average candle-power of the gas at Milwaukee?

A. 17.

Q. One of your companies makes and sells gas in the City of Grand Rapids, doesn't it?

A. Yes.

Q. And how much gas was made and sold there for the twelve months ending October 31st, 1906?

A. It made 739,158,400 feet and sold 670,016,500 feet.

Q. And what was the average price received for that gas per thousand?

A. 87.76 cents.

Q. And the average candle-power?

A. 18.3.

Q. And the prices in Detroit and Grand Rapids were those set by your company and were voluntary on their part, were they not?

A. The prices in Grand Rapids are voluntary on our part, yes. The price in Detroit is less than the average of last year, but the price now, the highest price is 80 cents, while the average for the twelve months was 81 cents. We made a reduction in April.

Q. What was the reduction from?

A. Previous to the middle of April we sold illuminating gas at 90 cents and fuel gas at 80 cents. The reduction was made to 80 cents all around for the first fifty thousand, 70 cents for the second fifty thousand, 60 cents for the second one hundred thousand and 50 cents for all over that.

Q. And those reductions were voluntary on part of the company?

A. Yes.

Q. Have you figured what the average price would be under the reduced rates?

A. The reduced rates if they had applied last year, the average would have been 79 cents. The very low rates cut no figure now. We hope to get power for that business after a while.

Q. You anticipate an increased consumption by reason of the reduction in price?

A. Yes.

4520 Q. Has there been any reduction in Grand Rapids from the figures for the twelve months ending October 31st, 1906?

A. Yes, it would be a little bit hard to explain, as we have adopted in a very large measure there a system known as the "readiness to serve"; the consumer pays so much for having his meter set there per month and so much for capacity, so much per light for that meter, and then he pays 50 cents for his gas after that, and we figure that it would reduce our profits on the quantity that they consumed previous to that about $40,000 or $50,000 a year, the reduction that we made would cut that a big figure.

Mr. MATHEWSON: Was that in Detroit?

The WITNESS: In Grand Rapids. I would like that on record, that we did that because we thought we were making too much money.

Q. But you anticipate that satisfactory results will result therefrom?

A. We expect to get it back, yes, sir.

Q. Where you have reduced your prices it has been your experience, has it not, that the amount of gas sold would increase owing to this reduction?

A. Nearly uniformly so, yes.

Q. If it did not increase you would consider that an exception to the general rule, would you not?

A. Yes.

Cross-examination by Mr. MATHEWSON:

Q. You find that consumption increases even when you do not lower the price, don't you?

A. Yes, sir.

Q. So that you would not consider all increase of consumption is due to a lowering of the price?

A. By no means; perhaps not half of it.

4521 Q. Do you know what the consumption per capita is of each of your companies to which you have referred?

A. I could hardly state them now, but I know about.

Q. Can you tell about?

A. Yes. That is of these companies that have been named? They are running about—Milwaukee and Detroit, I think, a little less than 6,000, Grand Rapids a little more.

Q. 6,000 feet per capita?

A. Yes.

Q. It is testified that the consumption at present in the Island of Manhattan is over 9,000 feet per capita, or higher than any other city in the world. Would it not be true that the higher consumption you get per capita the less opportunity there would be for increased consumption per capita beyond that?

A. Absolutely, yes, sir.

Q. And would not that be something to be taken into consideration when you are estimating what increase there might be per capita in the future?

A. Yes, sir.

Q. Would not the situation be affected also by the fact that Manhattan Island is surrounded by water and this company has no franchises in the suburbs outside, while in the case of Detroit and Milwaukee and cities of that character there is a suburban growth which the companies can annex constantly?

A. But which they dislike to annex as a rule.

Q. But it finally reaches a point where it is extremely profitable?

A. It reaches a point where they have to, to keep some other people from getting it. It helps street railways, but is bad for gas companies and electric light companies.

Q. You say a certain amount of meters is charged?

A. That is fixing the person for readiness to serve, we fix a charge of 50 cents for that service.

Q. And you know no such charge can be made in New York City?

4522 A. We do not make them there except by contract with each party. We are not required to do that.

Q. And you know in New York they are not permitted to make meter charges, don't you?

A. We do not call it a meter charge, but that is what it is in effect.

Q. And if you were comparing prices in cities where such a meter charge could be made with a city where it is impossible to make such a meter charge, that of course would have to be taken into consideration?

A. Yes. I do not lay any stress on the charges. You notice Grand Rapids averages 80 cents, even with this readiness to serve.

Q. And what is to be considered as nearly the average price which you get for your entire output?

A. That is the average price between these charges I speak of?

Q. And the average price is the important element?

A. Yes.

Q. You say that the Milwaukee gas is 17 candle power, about. Tested where?

A. It is tested of course, these records that we have are tested at our stations.

Q. You refer to 17 candle power at your station?

A. Yes.

Q. And maintaining an average of 17 candle power at your station don't you find that the candle power at the station sometimes drops below 15?

A. At the station?

Q. Yes.

A. No.

Q. It would at the consumers' in some instances?

A. It might, but we do not test it out there.

Q. Is that coal gas or water gas?

A. Chiefly coal gas.

Q. You have stated that these prices are prices which you have fixed voluntarily. Is it not a fact that in Detroit the prices 4523 were fixed pursuant to an arrangement which you made with the city by which your franchises were renewed or confirmed or something?

A. No.

Q. Is it not true in either one of the three cities?

A. No. In Detroit under our franchise we would have been compelled to make some reduction within a couple of years and we made it in advance of the time and asked the city to repeal a clause of the franchise that required us to report the quantity of illuminating gas sold each year; we would agree to report all of it, but we did not want to separate it, for it required us to keep two meters; and then we wanted the privilege of charging less than eighty cents and it took us about six months to get the privilege of reducing the price.

Q. In Milwaukee the gas is coke oven gas, is it not, largely?

A. A portion of it is.

Q. In which gas is regarded as a residual?

A. In the coke oven, yes, sir.

Q. Is there any law forbidding you to raise the price of gas again in any one of these three cities if you find that such conditions arise that it cannot be profitably delivered at these prices?

A. We could not raise the price of gas in Detroit until the expiration of the present franchise.

Q. How about Milwaukee and Grand Rapids?

A. In Milwaukee we have a perpetual and exclusive franchise where the price is not mentioned; it has been litigated and sustained by the Supreme Court.

Q. You would make an allowance, of course, if you were obliged to deliver in Milwaukee or in any one of these three cities gas testing 22 candle power, from your works with a penalty of $1,000 for every time the candle power fell by such test below the 22, as against the gas which you do now furnish, would you not?

A. I could not sell it at the same price at all, no.

4524 Q. Now you were almost asked what return you were earning in Milwaukee on your investment. Have you any objection to stating?

A. I am not almost persuaded to answer.

Q. Would you rather not state it?

A. I would rather not, yes, sir.

Q. Well, it is true is it not that your four and one-half per cent. bonds in Milwaukee are selling at about 93 or such a matter?

A. Well, I think that is the price they sold at the last that were sold. I don't know of any bonds sold at any price at the present time.

Q. Is it not true that the earnings were sufficient several times over to pay the interest on those bonds?

A. I prefer not to answer that question unless it is essential to do so.

Q. It is true, is it not, that the price of bonds depends to a considerable extent on the margin of earning capacity over the amount required to pay the interest on the bonds?

A. Yes, sir, and the character of the franchise.

Q. And in Milwaukee you say it is perpetual and exclusive?

A. Yes sir.

Q. Now, in Detroit you say the candle-power is 18 and a small fraction on the average; that also is at your works, is it?

A. At our works, yes, sir.

Q. And at Grand Rapids, 18 and a fraction, that is also at the works?

A. Yes, sir.

Q. Your experience in the gas business shows that conditions in the East in cities like New York, for instance, are substantially different from those prevailing in many regards in the manufacture and distribution in Western cities like Grand Rapids, Detroit and Milwaukee, does it not?

A. Yes, very much different.

Q. And you would not be willing to take any one of those three cities as a criterion of what you could afford to manufacture 4525 and sell gas in the City of New York, under conditions here prevailing?

A. I am not familiar with the conditions prevailing here now, I could hardly answer that question in a way which would be of any value to you. Years ago I was, but I know nothing of the conditions here now.

Q. Have you a franchise tax in the case of any of these cities?

A. In fixing the value of the property they took into consideration the value of the franchises. I think in the two largest of those cities, Detroit and Milwaukee, they put them something like two and one-half million dollars, the assessors themselves, but as I remember it, it is lumped, it is not put down as a separate item.

Q. Do you remember what your taxes per thousand are in the City of Grand Rapids?

A. I am not sure about that, I can tell you, but I cannot remember. What city did you ask for?

Q. Grand Rapids, or in any one of the three.

A. I have not got the details. I have got a great many details here which speak about the average of all the works we have, but not separately. I think in those two places the taxes are about 6 cents a thousand.

Q. Isn't it true that the cost of material and labor differs in different parts of the country?

A. We find it so, very materially so.

Q. And when you were in the City of New York and managing the Standard and East River Gas Companies, didn't you find that the expenses in many directions, as, for instance, laying mains and services, of repairs and maintenance, would cost far more than they did in the western cities?

A. Yes, sir.

Q. In view of the questions which you have been asked in the testimony to-day, do you desire to change your testimony at all 4526 as heretofore given as to the return which an investor in gas properties expects to earn on the investment?

A. No, sir.

Q. From your knowledge of the gas business, is it not true that that you would not be able to express an opinion as to the price at which gas could be manufactured and delivered in the City of New York with an adequate return upon capital, without a very careful consideration of details in New York?

A. No, sir; I would not want to.

Q. That depends finally and fundamentally, does it not, upon the conditions prevailing in each community as to the cost of material, cost of labor, character of pavements, burdens placed upon the company in the way of taxes and otherwise and all the other elements which differ in different cities, is that a fair statement?

A. Absolutely correct, yes, sir.

Redirect examination by Mr. **Kirby**:

Q. If you were considering the cost of producing and distributing gas in the City of New York, you would take into consideration these elements just spoken of by Mr. Mathewson, but would you not also take into consideration the cost at which you find you can produce and distribute gas in other cities?

A. I do not believe I get the gist of that question.

Q. If you were considering the cost of producing and distributing gas in a certain locality, would you not take into consideration the cost of producing and distributing gas in other cities with which you were familiar, as well as those elements of labor, material and such to which Mr. Mathewson has just referred?

A. He named about all, I think.

Q. Would you not take into consideration the density of the community or of the population, the amount of gas sold, and of mains?

A. I would. It is an important element.

4527 Q. And would you not consider that a large sale per mile of mains would be more advantageous as affecting the cost than a small amount of gas sold per mile of mains?

A. Yes. Very much prefer to have the larger sale It produces the interest on the investment.

Q. That is, a large consumption per capita is an element going to reduce the cost and distribution of the gas?

A. Yes, sir.

Q. Mr. Mathewson has made reference to the value of certain gas securities and the franchises which your companies have in the cities spoken of. Would you consider that where a franchise was doubtful or questioned by the municipality in which the company operated that a less return would be expected from the company's securities than if such franchises were not doubtful or questioned?

A. Well, I certainly would not expect to sell securities of a company located in a city where the franchise was in doubt at as good a price as I could sell it where the franchises were beyond doubt.

Q. In Milwaukee where a small portion of the gas which you use is coke oven gas, do you, or do you not, consider that your purchase of coke oven gas raises the price of your gas over that which it would be if you manufactured gas in place of your coke oven gas used, as respects the cost?

A. Let us reason a little bit. He did not ask me whether that reduced the cost or increased it.

Q. He did not.

A. Do you want to?

Q. I know what his argument is going to be and therefore I press the question.

A. Let us leave the coke oven out.

Q. Well, I had hopes it would be left out, but Mr. Mathewson asked the question and I think he might withdraw the question and we will leave the record stand without it. I do not want to go into it.

4528 Mr. **Mathewson**: I merely asked if part of the gas was coke oven gas.

Mr. **Page**: And which gas was a by-product?

Mr. **Mathewson**: Coke oven gas is a by-product, always, I believe. I do not understand there was any objection to my question.

The **Witness**: It is a residual with the manufacturer, but it is a principal with the purchaser.

By Mr. **Page**:

Q. And you buy it?

A. We buy it, yes, sir.

Q. What do you pay per thousand feet for the coke oven gas that you buy?

A. I won't tell you.

Mr. **Page**: I would rather have the record stand that way than have Mr. Mathewson's idea of it.

The **Witness**: I do not want to be disrespectful, but I should prefer not to tell.

Mr. **Page**: I have not asked that you be compelled to answer.

By Mr. **Mathewson**:

Q. You have stated that you were furnishing coal gas of the candle power that you have described in these cities; could you furnish to consumers a gas of 22 candle power tested a mile from your works at least—straight coal gas?

A. No; couldn't make it.

Q. You would have to enrich in water gas in that case, wouldn't you?

A. Yes, sir.

By Mr. **Kirby**:

4529 Q. And in these companies where the gas is furnished it is enriched so that it will be of the candle power indicated, is it not?

A. Yes.

By Mr. **Mathewson**:

Q. I desire to ask you whether there is natural gas in any one of these three cities to which you have referred?

A. Not at present; there has not been in any of them for three or four years.

Q. There was formerly, in Detroit?

A. In Detroit, formerly.

By Mr. **Page**:

Q. As I understand, the density of population, the amount of gas delivered per mile of mains, the amount of gas delivered per meter or consumer, is a very important element in determining the price which could be or should be charged for gas, is it not?

A. Yes, sir.

Q. In any of the cities that you have testified to is there as great a density of population, as large a sale per mile of mains, or as large a sale per meter as in the City of New York?

A. I should think not. Certainly not such a sale per mile of main, and I should think not as large per meter as in New York.

Q. And the per capita has been stated by Mr. Mathewson to be the largest sale of any city in the world, in the City of New York here to-day?

A. I don't know of any larger.

By Mr. Mathewson:

Q. Do you remember the sales per meter of these companies?

A. In the neighborhood of 30,000 a year per meter, I think.

Mr. Mathewson: Ours is only 34,000 feet per meter.

4530 The Witness: I can remember when our figures varied all the way from 30,000 to 35,000.

By Mr. Page:

Q. How many miles of main can you recall that you have in Milwaukee?

A. I think it is between 300 and 400.

Q. And Detroit and Grand Rapids, if you can recall?

A. Detroit would not be very far from the same, and Grand Rapids would not be more than half as much; less than half as much.

The witness is now excused.

Mr. Burr: The accountants inform me, since considering the matter during recess, that if they are afforded facility they can examine certain accounts for the year 1902 and report and testify regarding the same on Monday. Repair and renewal accounts, depreciation, legal and advertising, general expense, gas stoves, and oils.

The Master: That is what they said this morning.

Mr. Burr: Yes.

The Master: Well, what about the other questions that I suggested; that is, how it fits in with your associate, the State's plans, to have Monday taken up for that purpose? Also, what is there now to show me as to the materialty of this when it is done? I want some sort of succinct statement to indicate how in determining the reasonableness of the cost of gas at the present time a comparison of costs in past years as far back as you propose to go is going to be of service.

Mr. Burr: The testimony already in the case would tend to show that these items for 1905 were at least suspicious because they 4531 are so large. Take the question of the oil. Now, we believe that that is a very excessive price.

The Master: If I built a house in 1905 and had built a house of the same kind in 1900, would the fact that it cost me more in 1905 than it did in 1900 be necessarily suspicious? Might it not be at least more expensive in one year than in the other?

Mr. Burr: This is a little different. This is a public utility corporation whose expenses in one year are so much and in another year so much larger. We are entitled to have you know the exact situation for both years so that you might see the situation as the examination of the books shows; and we claim as a matter of argument upon that situation that these accounts to-day are most excessive, and that these prices that are paid are excessive in these various items and that they should not be charged to the cost of gas.

The **Master**: It may be. I do not say that you cannot show it, but I do not see how it necessarily follows from the fact that it was lower five years that the prices are excessive.

Mr. **Burr**: But to have the matter fairly presented we ought to have the benefit of a comparison with a prior year, in 1902.

Mr. **Mathewson**: If the Master please, I confess it is not necessary for me to add much to the statement of counsel, but it would be simply preposterous to go into the price of oil in 1902 to prove what we ought to get it at in the market to-day. Even 1904 is not the criterion, because their own witness has testified this afternoon that oil is up five-eighths of a cent beyond what it was a short time ago, a year ago, something like that, and it would consume time to absolutely no purpose.

4532 Mr. **Burr**: It is not consuming your time; it is consuming our time.

Mr. **Mathewson**: Well, it is. It is consuming our time.

Mr. **Burr**: Now, on that point, Mr. Master, we want to have an opportunity to compare the company's accounts before its investigation with them as they appear since its investigation.

Mr. **Mathewson**: The contracts as to oil are in evidence, covering, I think, the whole of the year 1904, or practically that, which was a period before any investigation was thought of. That was begun in 1905 and the resolution introduced in the Legislature in 1905, so that if it were pertinent at all, 1904 would be reasonably near and more valuable; but even that, it seems to me, would be wholly valueless, in view of the fluctuating prices of oil. It does not seem to me it makes any difference what we had to pay for oil in 1902 or in 1895. It is what oil is worth now and what we prudently can get it at.

Mr. **Burr**: It shows how much and what kind of oil you are using.

Mr. **Mathewson**: We had a lower candle power to take care of, also had a law which permitted us to have tests once a week and no penalty affixed unless three successive tests, a week apart, showed each time a candle power below 20.

The **Master**: Mr. Burr, unless you can show me something a little more specific, your application does not commend itself to my discretion very much. I do not think——

Mr. **Burr**: I cannot make it any more specific than I have made it; that, I think in justice to the defendants we are entitled to have a comparison of the accounts named for another year besides 1905. 4533

The **Master**: And another thing, especially when made at this stage of the case, when defendants are finishing up their case. If there was anything so very important about this it ought to have been revealed before this time, it seems to me.

Mr. **Burr**: We could not be in a position to make the application until the accountants had reported. They only finished their report this afternoon, by testifying to-day.

Mr. **Mathewson**: These oil contracts were put in by us months ago.

Mr. Burr: Months ago I asked for this examination and it was refused. It does not come out of your time, it will come out of our time. If these accountants can report on Monday on a few items, I think it would be wise to permit us to have it done.

The Master: You object to it, Mr. Mathewson, do you?

Mr. Mathewson: I do, most strenuously. It is impossible to do it, in the first place, as far as we are concerned, in that length of time, even to get out the vouchers for such examination as has been suggested by counsel.

The Master: How much of a force are you going to employ there?

Mr. Burr: The same force as they had before.

The Master: If I were at all satisfied of the materiality I would run the risk of the inconvenience and all that, but the difficulty in my mind is that I do not see how it is of any importance.

4534 Mr. Burr: It is important to show, for instance, whether the method of operation was different in 1902 from what it is at the present time, and whether the change in that method of operation has increased the cost of the manufacture and distribution of gas.

The Master: Assume there was a difference. What difference does that make? The question that I have got to decide is, what the conditions are to-day. Now, what they have done in the past, whether good, bad or indifferent, I do not see how it affects the question before me.

Mr. Burr: It will throw some light on it, if, as we claim, their expenses are enormous or unnecessarily excessive.

The Master: If that is so, there are plenty of ways to show it without trying to prove it out of their own mouths. Prove it by somebody else.

Mr. Burr: I think their books will show that.

The Master: I do not see that it is competent evidence as to value.

Mr. Burr: Well, I cannot do anything more than make the application.

The Master: If you can show me how you are prejudiced in any material way by not having it, or can satisfy me that the evidence would be such as I deem admissible when it does come here, that will be another thing.

Mr. Burr: If a condition of things appears, that they were economically conducting their business in 1902, in comparison with the method in which they are conducting their business now, that is something you should know. If there is any justification for the expense they are putting the company to to-day——

4535 The Master: It might be something interesting to know, but I do not think that would be of any assistance to me in determining the issues raised by this suit. The reason I hesitate is that I am loath in this case now to refuse any reasonable source of information. I think I have tried to be liberal in allowing testimony, even testimony about which I had grave doubts, but this involves a good deal of inconvenience to the complainant, on your own showing, and the time is very short. You have got other witnesses to examine before your time expires and I do not think that the importance of it is sufficient to justify me in asking that order now. I will deny the application, Mr. Burr, and let you have an exception to my ruling.

Mr. BURR: I take an exception.

Mr. KIRBY: We have no other witness this afternoon, Mr. Master.

The MASTER: None at all?

Mr. KIRBY: No, sir, none at all. It is after four o'clock.

The MASTER: Mr. Burr, you have no other witness?

Mr. BURR: I will be, as I explained, ready in the morning to proceed with Dr. Marks.

The MASTER: There being no other witness ready we will adjourn until to-morrow at half past ten.

Mr. PAGE: In order that we may make our preparations, are we going to sit Saturday of this week?

The MASTER: If you like. I am at your service. I made no other engagements.

Mr. PAGE: I shall be glad to sit Saturday, and we will be prepared to go on.

At 4:10 o'clock P. M. adjourned to December 5, 1906, at 10:30 A. M.

4536 UNITED STATES OF AMERICA,
Southern District of New York, ss:

I, John A. Shields, Clerk of the Circuit Court of the United States of America, for the Southern District of New York, in the Second Circuit, do hereby Certify that the foregoing (Vol. 6) pages, numbered from 3667 to 4535 inclusive, contain a true and complete transcript of the record and proceedings had in said Court, in the cause entitled Consolidated Gas Company, Complainant, Appellee, against Julius M. Mayer, as Attorney General, *et al.*, Defendants-Appell*ee*-, as the same remain of record and on file in my office (Vol. 6).

In Testimony Whereof, I have caused the seal of the said Court to be hereunto affixed, at the City of New York, in the Southern District of New York, in the Second Circuit, this 15th day of May in the year of our Lord One Thousand Nine Hundred and eight and of the Independence of the said United States the One Hundred and thirty-second.

[Seal of U. S. Circuit Court, South. Dist. New York.]

JNO. A. SHIELDS, *Clerk.*

4537 Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,
vs.
JULIUS M. MAYER, as Attorney General of the State of New York; WILLIAM TRAVERS JEROME, as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIEN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and THE CITY OF NEW YORK, Defendants.

Before Arthur H. Masten, Special Master.

NEW YORK, *December 5th*, 1906.

Met pursuant to adjournment.
Present: The Master, Mr. Mathewson, Mr. Page, Mr. Burr.

U. S. Circuit Court, Southern District, N. Y. Filed June 24, 1907. John A. Shields, Clerk.

4538 Mr. MATHEWSON: A request was made yesterday by one of the counsel for the defendants for leave to sample the oil which the company is using. I saw no objectiion to it personally, except that it seems to me to be immaterial, but I felt that it was a little outside of counsel's province and I desired to consult the officers of the company. I have to say this morning that, subject to the objection that it is immaterial, we have no objection to its being done. But in order that no question shall arise, I would like to have it understood that the sample shall be drawn in the presence of a representative of the defendants; that the sample which is drawn shall be equally divided between the defendants and ourselves; and that the defendants shall indicate the plant at which they want the sample drawn, and they can draw the sample at any plant they please to designate from the oil just as it is being fed to the machines, so that there can be no doubt about it. Is that a fair suggestion?

Mr. KIRBY: That seems to be fair, and it is quite satisfactory to the counsel for the defendants, who made the request, and to the defendant.

Mr. MATHEWSON: I should say this, that during this cold weather for some time we have been using, as I understand, nothing but the 34-degree or above oil, and I do not think we have any 28-degree oil at all from which samples can be drawn. That is something that we have no control over, but that, I understand, is the situation.

Mr. KIRBY: I presume, however, that such oil could be obtained at Bayonne.

Mr. MATHEWSON: I do not know, but we are talking about the oil delivered to us under the contract.

Mr. **Kirby**: I mean designated by you as such as would be delivered under the contract.

Mr. **Mathewson**: I don't know about that, no. I would 4539 not like to say that, because I don't know. The question was whether we are receiving the oil as prescribed under the contract, and I do not see how that can be tested except by testing the oil which we are receiving, because I may say that all the oil as the company receives it, every tank, is tested by the company.

Mr. **Kirby**: I believe that is so from your books that we have had the opportunity to see.

Mr. **Mathewson**: And you can see by drawing oil at Bayonne, if you found oil of less gravity than we require we would simply say that if it had been tendered to us we would have rejected it.

Mr. **Kirby**: Very good. Then shall I arrange with Mr. Addicks or Mr. Bradley about it?

Mr. **Mathewson**: Yes, you had better telephone Mr. Addicks, as he is the officer with whom I spoke.

Mr. **Kirby**: I shall make the arrangement with him as soon as I am through with these two witnesses, who will only take a very few moments.

Edwin Craven Midgley, called as a witness for the defendant, the State of New York, being duly sworn, testified as follows:

Direct examination by Mr. **Kirby**:

Q. Mr. Midgley, on the days of November 28th and November 30th, did you, with one Michael Gilmore, who, I believe, is sitting at your right here, make an inspection of certain openings in the street in the Island of Manhattan for the purpose of ascertaining how far below the surface of the street were such gas pipes as you observed in such openings?

A. Yes, sir.

Q. And did you observe any of such pipes to be 24 inches 4540 or less below the surface of the street?

A. Yes.

Q. Did you make a list of such pipes?

A. I did.

Q. Is the schedule which I show you (handing paper) one giving the location, the size of such main, and the depth of such main below the surface of the street?

A. It did.

Q. Will you state the results shown upon such list?

Mr. **Mathewson**: Let me see it; it is not necessary to have him repeat it.

Mr. **Kirby**: I want it to go in in connection with his testimony.

The **Witness**: I found fourteen places in which the gas mains were two feet or less below the surface; there are thirteen in this list and the one which I found yesterday.

EXHIBIT A.

List of Some Gas Mains Which Are Laid Two Feet or Less Below the Paving Surface.

Location of gas mains.	Size of main.	Depth below surface of street.
S. E. cor. 7th Ave. and 135th St.	16 inches.	20 inches.
N. E. cor. Broadway and 112th St.	6 "	24 "
S. E. cor. Park Ave. and 60th St.	10 "	23 "
N. W. cor. 2d Ave. and 60th St.	4 "	22 "
S. W. cor. 2d Ave. and 62d St.	6 "	20 "
S. W. cor. 2d Ave. and 62d St.	6 "	18 "
S. W. cor. 13th St. and 6th Ave.	12 "	12 "
N. W. cor. 1st Ave. and 40th St.	6 "	20 "
N. W. cor. 6th Ave. and 14th St.	6 "	23 "
S. E. cor. 6th Ave. and 11th St.	16 "	15 "
Whitehall and Water Sts.	6 "	15 "
S. W. cor. 8th Ave. and 35th St.	12 "	15 "
N. W. cor. Fulton and Pearl Sts.	...	11 "

Q. Where is the one which you just spoke of, which is not upon this list?

4541 A. That is at the northwest corner of Tenth Avenue and 42d Street—no, it is the southeast corner of Tenth Avenue and 42d Street.

Q. What was the size of that main?

A. There are two mains there, one 12-inch main, 16 inches deep, and one 6-inch main, 22 inches deep.

Q. Did you find any mains besides those which were slightly above two feet in depth below the surface of the street?

A. I found three others at a depth of two feet—between two feet and two feet four.

Q. Are they indicated on this schedule I hand you (handing paper)?

A. They are.

Mr. MATHEWSON: How deep?

The WITNESS: Between two feet and—well, the deepest was two feet four inches.

EXHIBIT B.

List of Some Gas Mains Which Are Laid Between Two Feet and Two Feet Six Inches Below the Paving Surface.

Location of gas mains.	Size of main.	Depth below surface of street.
N. W. cor. Broadway and 119th St.	6 inches.	2 ft. 2 in.
Clairmont Ave. and 119th St.	6 "	2 ft. 4 in.
N. W. cor. 40th St. and 1st Ave.	20 "	2 ft. 2 in.

Q. Now, Mr. Midgley, in making this inspection, or in such instances as you did not, did Mr. Gilmore make these measurements?

A. In every case.

Q. How did you make the measurements?

A. We obtained a plank or straight edge of some kind and placed it across the trench and used a rule to measure the depth from the top of the main to the under edge of the plank, the straight edge which would be level with the pavement.

Q. Did you observe other pipes in the street at the time 4542 you made these inspections?

A. Yes, we visited a great many of them and in most cases we observed pipes of one sort or another.

Q. And in all instances you did not observe gas pipes?

A. Not in all instances, no.

Q. And how did you ascertain which were gas pipes or mains and which were not?

A. I relied chiefly on Mr. Gilmore's knowledge of the mains, and with that, and by a process of elimination of any other mains, we arrived at the gas mains.

Q. What do you mean by process of elimination?

A. We would find the position of the water mains.

Q. How would you find that position?

A. By the manholes; the covers were lettered along the street.

Q. Lettered in what way?

A. D. P. W. or Croton Water.

Q. Having found the water main, what would you eliminate?

A. The subways and salt water mains which are being put in on certain streets and the steam pipes.

Cross-examination by Mr. MATHEWSON:

Q. One of these pipes which was laid at a depth of 24 inches or less from the surface, according to your schedule, was at the corner of Whitehall and Water Streets, wasn't it?

A. Yes.

Q. Now, is it not true that every instance of these thirteen which was only 24 inches or less in depth was at the corner of the street?

A. Certainly, practically every opening we examined was at the corner of a street.

Q. Well, every one on this schedule was at the corner of a street?

A. Yes.

Q. How many openings altogether did you examine in the streets?

A. I did not count them, but I went to a good many.

Q. And these are all the measurements that you took, 4543 shown in these two schedules?

A. I took only measurements—I regarded the measurements of such as were less than 2 feet 6 inches below the surface. I was not interested in any others.

Q. No. You found a great many more that were more than 2 feet 6 inches below the surface, didn't you?

A. A good many.

Q. At the corners of the street also?

A. At the corners of the streets?

Q. As well as in the streets and not at corners?

A. There were very few openings in the streets which were not at corners, which disclosed gas pipes. They were mostly too far out from the curb.

Q. Were not the surfaces of the streets where these occurred curved, that is, convexed upward?

A. Very slightly, I presume; there is a curve on every street.

Q. Did you take a measurement from the curb to these various pipes?

A. In all cases.

Q. Have you such measurements?

A. I have (producing paper).

Mr. KIRBY: Just read it.

Mr. MATHEWSON: No, I do not think it worth while to read it yet.

Q. I suppose this relates to these schedules?

A. Yes, in every case I took a measurement.

Q. Do you know whose gas pipes these were, whether of the Consolidated Gas Company or other companies?

A. I was informed in some cases that certain mains were the Consolidated Gas Company's or the Standard's.

Q. Who informed you?

A. Mr. Gilmore.

Q. Did you measure to the top of the pipe in each case?

A. Yes.

Q. The top of the pipe at the highest point of the pipe?

4544 A. Well, as far as could be judged by the eye, it was at the highest point.

Q. Was it down to the run of the pipe or was the measurement to the top of the pipe where it is nearest the surface, including the flanges or fixtures?

A. Do you mean the bells?

Q. Yes.

A. No, we never took a measurement to the top of the bell; it was always to the straight run of the pipe.

Q. You found that the pipe was nearer the surface at some one point where you made the measurements than it was at some other point, didn't you?

A. No, we did not——

Q. You merely took what appeared to be the highest point to the eye, as you say, and made your measurements that way?

A. No, the place we took the measurement in nearly every case was the best place to take a photograph, at one end of the trench, and the best place to see the street surface.

Q. Are these openings still existing?

A. I could not say.

Q. Have you any objection to pointing out to our representative the particular pipes shown in these schedules?

A. I have no objection whatever.

Mr. **Mathewson**: Assuming that they cannot be identified by us otherwise, Mr. Kirby, you have no objection, I presume?

Mr. **Kirby**: Absolutely none.

Q. Now, can you give me any estimate of the number of measurements which you made and which you did not include on these two schedules?

A. On a very rough guess I should say about as many again, perhaps slightly more; but not very many more.

Q. What is your business?

A. I am employed in the office of Kirby & Wood; I am employed in Mr. Kirby's office.

4545 Redirect examination by Mr. **Kirby**:

Q. Are you a graduate of any university or school?

A. Cambridge University.

Q. What course did you take while there?

A. Engineering, special and general.

By Mr. **Mathewson**:

Q. Did you measure the width of these trenches at the top?

A. In a few cases, but as the gas main in most cases ran across the trench and not along it, with either a trench for a subway or the salt water system, I did not take very many of such measurements.

Mr. **Kirby**: I will give Mr. Mathewson more information along that line——

Mr. **Mathewson**: Is there any objection to me having a copy of the location of these pipes which the witness says he has, and hasn't spread on the record?

Mr. **Kirby**: I am going to put in evidence the schedule, which will give all this detailed information, and which will save the trouble of Mr. Midgley going around, or anybody else.

By Mr. **Kirby**:

Q. Have you prepared a schedule showing the result of your and Mr. Gilmore's inspection of these mains, giving the distance from the curb, such observations as you made as to whether or not the mains were those of the Consolidated Gas Company, and Mr. Gilmore's and your own conclusions as to whether or not you were absolutely sure that the mains examined were or were not the Consolidated Gas Company mains?

A. I have.

Q. Is this schedule which I show you the result of your inspection in that regard?

A. It is.

4546 Q. Did you find these mains to be in good condition? By that I mean were they under repair at the time you examined them?

A. Well, I do not feel that I am called upon to judge of that. I can only say there was only one or two instances that I smelled any gas.

Q. Were the workmen, as a rule, working upon the gas main which was exposed, or other work?

A. No, in very few instances were they working on the gas mains.

Mr. Kirby: That may be spread upon the record.

Inspection of Gas Mains, Nov. 28th, 1906.

1. N. W. cor. Broadway and 119
6-inch Main runs under sidewalk 11 feet 2 inches W. of
W. Curb line 27 inches deep Sure
Stop cock cover Con. Gas. Co.
Water Main runs 3 feet E of gas main.

2. Clairmont Ave. and 119 St. Con Gas
28 inches deep 6 inch main Sure
3 feet 6 inches E. of W. Curb.

3. 7th Ave. and 135 St. S. E. Cor.
6-inch Main Consol. Gas Ribbed 2½ inches by ½ inch.
20 inches deep Sure
3 feet 6 inches N. of S. curb line
Trench 22 inches wide.

4. N. E. Cor. Broadway and 112 St.
6-inch main, 24 inches deep. Laid under sidewalk. Sure
7 feet S. of N. curb and 11 feet E. of E. curb.
Valve box on sidewalk.

5. S. W. cor. Broadway and 62 St.
6-inch main under sidewalk Sure
11 feet W. of W. curb.

4547

6. S. E. cor. Park Ave. and 60th St.
10-inch main 23 inches deep. Wrought Iron (Standard) Sure
11 feet 4 inches W. of E. curb.

7. N. W. cor. 60th St. and 2nd Ave.
4-inch main 22 in. deep Sure
2 feet 9 inches S. from N. curb.

8. S. W. cor. 2nd Ave. and 62nd St.
6-inch main 20 inches deep Sure
4 feet N. of S. curb.

9. Also Elbow curves over other main 18 inches deep Sure
9 feet E. of W. curb.

10. S. W. cor. 13th and 6th Ave.
12-inch main. In his opinion a gas main but not positive
12 inches deep
10 feet E. of W. curb.

11. Corner of Fulton and Pearl Sts.
Main 11 inches deep
Water main runs down middle of St.

12. N. W. corner 40th St. and 1st Ave.
3 ft. N. of corner 7 feet 4 inches E. of W. curb Sure
6-inch main—Consolidated—Ribbed Spirally
20 inches deep.

13. 20-inch main 1 ft. West of #13
26 inches deep Sure
Water main in these cases 15 feet E. of W. curb.

14. N. W. corner of 6th Ave and 14th St.
6-inch main, 23 inches deep
3 feet 6 inches S. of N. curb
In G.'s opinion a gas main, but not sure, as could not locate water main.

4548

15. S. E. corner 6th Ave. and 11th St.
16-inch main with 4-inch outlet 8 ft. E. of W. curb Sure
15 inches deep
12 in. Salt water main, trench averages 2 ft. wide.

16. Corner of Whitehall and Water St-.
9 feet W. of E. curb Sure
6-inch main 15 inches deep—shows plug
Water main 1 ft. West.

17. S. W. corner 8th Ave. and 35th St.
12-inch main 13 feet E. of W. curb
15 inches deep. Not absolutely sure

By Mr. Mathewson:

Q. Were the streets paved in every instance?

A. The greater number were asphalt streets. I think there were one or two up in the far north which were macadamized.

Q. The plank to which you have referred was laid across on top of the pavement whatever it was?

A. It was.

By the Master:

Q. For how long a time have you been engaged in this work?

A. I took two days.

By Mr. Mathewson:

Q. These are all the measurements for location which you have made, which are shown on this schedule?

A. Yes.

4549 MICHAEL GILMORE, called as a witness in behalf of the defendant, the State of New York, being duly sworn, testified as follows:

Direct examination by Mr. KIRBY:

Q. Mr. Gilmore, at the present time are you in the employ of the Department of Water Supply, Gas and Electricity of the City of New York?

A. Yes, sir.

Q. What position do you there hold?

A. Inspector of lamps and gas.

Q. When did you enter the employ of the City?

A. In 1903, in March; March 4th, I think it was.

Q. Prior to that by whom were you employed?

A. The Consolidated Gas Company.

Q. And as such, what duties did you perform for that company?

A. Fitting serves and stand-pipes and resetting lamp-posts.

Q. To perform such duties it was necessary for you to know a gas main when you saw it, was it not?

A. Yes.

Q. And it was to these gas mains that you made your fittings of the services to the houses or lamp-posts or whatever it might be?

A. Yes.

Q. How long were you employed by the Consolidated Gas Company?

A. 11 years.

Q. Are you the Mr. Gilmore spoken of by Mr. Midgley as having spent the days of November 28th and 30th in measuring the depth of certain gas mains below the surface of the street?

A. Yes.

Q. Will you describe how you went about ascertaining whether or not the pipe, the depth of which you measured, was or was not a gas main?

A. Well, the same as Mr. Midgley stated, the first thing I looked for was to get a line on where the water main was by looking for the manhole cover with the Department of Water *of* Supply on, 4550 and then outside of the subways, all other pipe is considered gas pipe.

Q. When you would find the pipe itself, which by this process of elimination you would consider as being or which ought to be a gas pipe, would you look at the character of the pipe for the purpose of ascertaining whether or not it was a gas main, to your mind?

A. In some cases we did.

Q. And in those cases did you come to the conclusion that where you made the measurements you were positive that it was the gas main?

A. Yes.

Q. Now, there were three instances, were there not, as set down in this schedule, in which you were not positive, but which, in your opinion, you believed to be a gas main?

A. Yes.

Q. And those were the ones set down on this schedule as No. 10, the main at the southwest corner of 13th Street and Sixth Avenue; No. 14, northwest corner of Sixth Avenue and Fourteenth Street, and No. 17, southwest corner of Eighth Avenue and 35th Street?

A. Yes.

Q. In each other instance your were positive it was a gas main?

A. Yes.

Q. And came to such conclusion by reason of your experience and training in such matters and through the manner that you have stated?

A. Yes, sir.

Cross-examination by Mr. MATHEWSON:

Q. The measurement was made down from the plank to the highest point of the plank in each case?

A. Yes, sir.

Q. Who did the measuring, you or Mr. Midgley?

A. Mr. Midgley sometimes and sometimes I made the measurements, between the two of us.

Q. When you made it, what sort of a rule did you have?

A. Two-foot rule—three-foot rule.

4551 Q. Did you have a telescopic rule so you could put it directly against the plant in the middle and pull it down until it struck the main, or vice versa?

A. No, sir; just an ordinary three-foot rule.

Mr. KIRBY: A yardstick?

The WITNESS: A yardstick.

Q. Did you put the rule on the top of the pipe and then note the reading at the bottom of the plank?

A. Yes.

Q. Or did you put the rule in any case up against the bottom of the plank and then conclude where the top of the pipe would come on the rule?

A. No, we put it on top of the pipe and held it up to the stick.

Q. What were your duties while you were with the Consolidated Gas Company?

A. Refitting of new lamps and refitting of new services and standpipes to the lamps.

Q. You were not connected with the mains department, the laying of mains?

A. No.

Q. How do you know a gas pipe from any other pipe in the street, from any other pipe of the same size and material?

A. Well, generally, the water main is laid in the center of the street and it has "Department of Water Supply" on it or "Croton Water"; all other mains near the curb are considered gas mains.

Q. And that was the rule you proceeded on in determining these were gas pipes?

A. In some cases.

Q. Was that not the case in most cases?

A. No.

Q. How else would you know?

A. By the spiral running around a 6-inch main, which indicates the Consolidated Gas Company mains.

Q. A spiral?

A. A mark running around a 6-inch main.

4552 Q. That indicates a Consolidated main?

A. Yes, sir.

Q. Where did you learn that?

A. In my business, in the gas business.

Q. With the Consolidated Gas Company?

A. Yes.

Q. And when in this schedule, which has been spread upon the record, I find the word "sure," that means, if I understand you correctly, that you felt very sure those were gas mains?

A. Those were gas mains, yes, sir.

Q. Is it your contention that no other company but the Consolidated used these spirals in indicating its pipes?

A. Yes, sir, that is running around.

Q. That is your understanding?

A. Yes, sir.

Q. When you were with the Consolidated Gas Company, how did you know the pipes of the Consolidated for the purpose of connecting them up where they came within your province? Were they pointed out to you by a foreman?

A. No, sir.

Q. How did you know them?

A. I did know them.

Q. You did not?

A. I did know them.

Q. Do you mean to say you know the mains of the Consolidated from the mains of any other company when they are exposed?

A. When they are exposed.

Q. When you went to make your connections while you were with the Consolidated Company, how did you know that the mains were the Consolidated Gas Company's mains?

A. On the north side of street, three feet or four feet from the curb, is the Consolidated; on the south side of the street, three or four feet from the curb, is the New Amsterdam; outside of that, or wrought iron pipe, is the Standard.

Q. You mean to say that is universal?

A. That is universal.

4553 Q. All through the city?

A. Pretty nearly all through the city.

Q. And that was the way you determined which were the mains of the Consolidated in making connections?

A. Yes, sir.

By Mr. Kirby:

Q. You spoke of measuring the distance from the highest point of the main to the surface of the street. Do you mean by that that you measured from the top of the bell?

A. We measured from the top of the pipe where you tap. We put a rule on the center like this here (indicating); we put it on the top of this right here and then we hold the stick over the pavement and get the level.

Q. But you would not measure where two pipes join or come together, and where there was an edge or bell?

A. Do you mean at the hub?

Q. Yes.

A. No, sir.

WILLIAM D. MARKS, recalled on behalf of the City:

Direct examination by Mr. BURR:

Q. Since your last appearance here as a witness I believe you have been acting as one of the Advisory Engineers to the accountants engaged in making an examination of the books of the Consolidated Gas Company?

A. I have.

Q. And you have also made an examination of the plants of the company, or some of them?

A. With Mr. Lacombe I examined the meter shop and also one of the fitting or jobbing shops.

Q. For what purpose?

4554 A. As a member of the Advisory Commission, being taken to these two shops by Vice-President Addicks for the purpose of examining their methods of doing work and keeping account of it at the shops; the meter shop and the jobbing shop.

Q. Was that visit the result of any difficulty which, as a member of the Board of Advisory Engineers acting in connection with the accountants, you experienced?

A. Yes, sir.

Q. And it was for the purpose of verifying those vouchers that that visit was made by both yourself and Mr. Lacombe with President Addicks to these shops?

A. As members of the Advisory Commission we were confronted by a very large number of vouchers which did not go into detail or definitely indicate their use after disappearing into these shops, and it was for the purpose of finding out how this material was handled that we applied directly to Mr. Addicks, Vice-President, and had from him an explanation which was very satisfactory and clear.

Q. That explanation or information you were unable to obtain before that time?

A. We made a number of applications before that, failing to obtain the information, and have particularly charged the accountants—Mr. James Hall in charge—with the question of what became—in fact, we made a record of our query, which is noted in the minutes of the Advisory Commission. I can read that, if you wish.

Q. No, that is all in evidence here. Whatever you did with regard to those disputed or doubtful vouchers, your action appears in the minutes of the Board?

A. It does.

Mr. Mathewson: Mr. Master, I do not intend, if I can help it, to waste time in putting in any rebuttal evidence. The Master knows very well, I think, from what has appeared here that we offered long ago to permit an inspection of any apparatus, if the vouchers
4555 were pointed out which were in doubt, and we were not given a list of the vouchers. I do not like to have the witness appear and say he never had any opportunity——

Mr. Burr: I do not like to have statement appear on the record, because it is not true. The vouchers were spread out for your examination.

The **Master**: Do not let us have any further argument on this subject.

Mr. Mathewson: I do not care anything about your statement that my remark is a misstatement. I did tell the truth, and you can say anything you please. It does not worry me at all.

Mr. Burr: I can return the compliment.

Q. Is it or is it not a fact that these various vouchers which were recognized as disputed or doubtful by the accountants and by your Board of Advisory Engineers were laid aside for the inspection of the officers of the Consolidated Gas Company, and their attention specifically called to those vouchers?

A. They were. I saw them on either Mr. Addicks' or Mr. Carter's table the day on which Mr. Lacombe and myself went for the purpose of seeing Mr. Addicks directly.

Q. Was their attention called to the specific vouchers in writing or orally, if you recall?

A. Mr. Hall was instructed in writing to place these vouchers, and a list of them, I think, although—no, no list, but simply to select these vouchers as mentioned and place them before the officials of the Consolidated Gas Company.

Q. Now, in addition to that occupation since your last ap-
4556 pearance here have you also been engaged in making an examination of the maps of mains?

A. I have.

Q. Those maps of mains number how many volumes?

A. The maps of mains shown by the Consolidated Gas Company number twelve volumes, of which Mr. Simpson said that two volumes——

Q. I only want to know how many volumes there were, how many maps in each volume, so that the Master can get an idea of the magnitude of the task you undertook to accomplish?

A. (Continuing:) Of which Mr. Simpson said that two, volumes 9 and 10, devoted to The Bronx, had very little in them, and would not interest us. We accepted his statement and figured on those volumes. Of these twelve volumes there were about three hundred and ten maps, each mapping a certain portion of the Island of Manhattan.

Q. And do you recall the testimony in this case that there were mains belonging to the Consolidated Gas Company in every street in the City of New York?

A. I do.

Q. So that you have practically made an examination of the mains of every street in the City of New York, so far as they are shown by the maps of the company? I mean on the Island of Manhattan?

A. On the Island of Manhattan, so far as they are shown by the maps of the company, and measured them.

Q. Have you been engaged in any other work since that time that I speak of, when you last appeared here as a witness? I mean in connection with this case?

A. I have also been engaged in the appraisal of the 14th Street coal gas station of the Consolidated Gas Company.

Q. Have you just finished that appraisal?

A. I have.

4557 Q. That work that you have described as having been engaged on has kept you pretty busy since the time you appeared here as a witness, has it not?

A. With a number of assistants, amounting to about eight, and myself, we have toiled uninterruptedly.

Q. About how many hours a day?

A. I should say an average of fourteen hours a day, working time.

Q. And from your observation of counsel for the city, have you any hesitation in saying he has worked the same number of hours in the same business; that is, in the trial of this case?

A. What is that?

Q. Is it or is it not a fact that counsel worked about the same number of hours preparing for the trial of this case during that time?

A. Counsel has been ever with us.

Mr. Mathewson: The counsel has been here a considerable part of the time and you have not, Doctor. I do not see how that can be.

Mr. Burr: The Doctor is speaking of the time I have spent here, the time I spent with him and the time I spent with the other experts in this case. The point is, I want to show there has been no *laches* or neglect on the part of either——

The Witness: I referred more particularly to the meetings of Mr. Burr before attending the session in the morning, the meetings at noon, and then in most cases the whole of the evening as well.

Q. Well, you say you have made an examination of the 14th Street plant?

A. I have.

Q. Before proceeding to that subject, Doctor, I want to call your attention to a particular item in the accounts to which your especial attention was called by Mr. Mathewson when you last appeared here. I refer to the charge, depreciation, $282,219.67?

A. Yes.

4558 Q. And you recall the examination of Mr. Mathewson in that regard, do you?

A. I do.

Q. And the inquiry made of you as to the reason for your rejection of the 2.12, contingent per thousand, which Mr. Carter adopted, and the adoption by you of another figure for a lesser amount?

A. I do.

Q. What do you find, as a matter of fact, from the examination of the accounts in the books of the company?

A. I find that the $282,219.67 did not represent an actual expenditure as I had suspected, but that it represented a cross entry to depreciation made by order of the Board of Directors of the Consolidated Gas Company, January 30, 1906. And, further, that this $282,219.67 cross entry, not representing any actual expenditure whatsoever, as I suspected——

Mr. Mathewson: Oh, I move to strike that out, "as I suspected." This is virulent from the beginning.

The Master: Strike it out.

Mr. Burr: Exception.

The Witness (Continuing): Was $60,000 in excess of the proper cross entry, because depreciated mains for 1903 and 1904 were introduced into the depreciation for the year 1905, leaving a balance of about $220,000 charged by cross entry to depreciation, or an average as deduced by the accountants of 1.71 cents per thousand cubic feet of sales.

Q. In other words, you stated to Mr. Mathewson, at that time, your reason for rejecting that amount and adopting the smaller amount, as your testimony appears on page 3686, where you say: "I explained as fully as I was able my reasons for that selection. I do not think I can add anything to it." And you are confirmed in your——

4559 Mr. Mathewson: Whether he is confirmed or not appears, doesn't it, from what the fact is? Is there any use in rehearsing his prior testimony?

Q. Do you see any reason to change your testimony in that regard as a result of the examination of the accountant or does it confirm what you previously testified to?

A. It confirms.

Mr. Mathewson: Objected to as——

The Witness: It confirms my previous testimony.

Mr. Mathewson: Wait a minute when I object. I object to it as incompetent, immaterial and irrelevant.

Objection sustained. Exception.

Q. When did you begin to make an examination of the 14th Street plant?

A. During the early part of last week. I cannot fix the date exactly.

Q. How long were you engaged in it?

A. In the actual inspection of the plant, almost all of the week.

Q. And have you since been engaged in tabulating the result of such examination and inspection?

A. I have.

Q. Have you finished the tabulation of the mains this morning, or will you have them ready to-day?

A. I have finished the tabulation of the mains for the Island of Manhattan and The Bronx, as stated in the estimate from Mr. Simpson and the book figures. I have gotten the lengths in feet and miles of each size, but I have not yet quite completed the computation of the value of these mains. That should be completed within a few hours.

Q. In making this examination of the 14th Street plant, were you assisted by anyone?

4560 A. In examining the 14th Street plant I was assisted by Chief Engineer Lacombe and by Mr. H. H. Edgerton.

Q. What is the total amount of your appraisel of the buildings and apparatus of the 14th Street station?

Mr. **Mathewson**: Has the witness made a schedule of the 14th Street station?

Mr. **Burr**: Yes, sir.

Q. Regarding the schedule, Doctor, how was that made up? How was the schedule made up?

A. I have not answered the other question. I should like to find the figures, first.

Mr. **Mathewson**: I object to this question on the ground that the witness is incompetent and not proven expert sufficiently enough to testify on that subject.

Mr. **Burr**: All his qualifications have already been gone into.

Objection overruled. Exception.

A. $1,454,664.00 for the buildings, holders, and manufacturing apparatus of the 14th Street station.

Q. How did you obtain this?

A. From a catalogue furnished by the Consolidated Gas Company, a bill of material or an inventory was drawn off for the use of the three engineers appointed. From the testimony given by Mr. Mayer the values fixed were placed on this bill by a careful reading of the testimony, as Mr. Mayer's inventory as a whole was not put in evidence. This bill of material or inventory was taken and the prices fixed by the gentlemen named, Messrs. Lacombe, H. H. Edgerton, and, so far as the iron work was concerned, by President Logan of the Logan Iron Works. With the exception of myself, 4561 no one member of the Committee of four fixed all the prices or the prices on all the different parts of the works. For the purpose of obtaining a clear comparison of the views of each of the gentlemen named, their values were put down in a tabulated form, giving the value for each item as given by or estimated by each member of the Commission. Then, in addition to this, the inventory by Thomas L. Rowland, 1884, shown in Senate Document 97, was analyzed for the purpose of obtaining his values of such details as were in existence in 1884, and from this comparative tabulation, which is in rather too bulky a form for ordinary use, I drew off a brief statement of the value of the works, making it $1,454,664.

Q. Now will you give us the details?

Mr. **Mathewson**: Do you mean the detailed valuations of the different classes——

Mr. **Burr**: A summary; the totals.

Mr. **Mathewson**: Mr. Master, I shall have to object to this testimony as to valuation. It is not the testimony of this witness apparently, as to what he believes the present value or the cost of reproduction of these works is; it is evidently conglomerate, made up from various things and considerations and men; and, besides that, he puts in here Mr. Logan's valuations, as he says they are; whereas Mr. Logan himself has been on the stand and testified, and you will remember that Mr. Logan in many instances said that he thought the figures which Mr. Mayer had given as present value less depreciation, were not too high. I then asked him whether the figures which Mr. Mayer gave as the original cost of them were too high, if he considered new value, and he said no, he thought they were right.

I do not know what figures the witness has used here, and 4562 I do not think it is of any importance, but, I submit, you cannot prove the value of a plant by any such method of testimony as this. It is utterly impossible to cross-examine this witness as to what was done by Mr. Rowland or what his theory is, or what Mr. Lacombe's theories are.

Mr. **Burr**: You misunderstood the witness. The witness says that for the sake of convenience he has arranged the schedule. You asked him with regard to a schedule or inventory, and he proceeded to tell you what sort of an inventory he has here before the Master, and he tells you he has arranged the various valuations on the schedule. He is about to testify to his own valuation of the matter, his own consideration of the plant and apparatus.

Mr. **Mathewson**: I move to strike out the witness' testimony that the value is $1,454,664.00, of the 14th Street plant, in view of his statement as to the method in which that was made up.

The **Master**: He has said that he himself had valued all the articles, and he was the only one that did. Now, it is perfectly proper for him to come and testify as to his own valuation on those articles, and that he will be restricted to. Of course, he cannot testify about any average made by comparison of his figures and those of the other members of the so-called Advisory Board. I do not understand that he proposes to do that. If he does that, the objection is sustained.

Mr. **Burr**: There is no such intention. He is going to state his own valuation of this plant and give his reasons for the valuations.

The **Master**: But the fact that he was sustained or confirmed in any way by any of these others is entirely incompetent and 4563 irrelevant. He dwelt on that at some length, but that does not cut any figure here.

Mr. **Mathewson**: He says the iron work, which is part of this, was valued by Mr. Logan, and not by him.

The **Master**: That was redundant and irrelevant, but let it go, in view of what Mr. Burr says, that he is going to testify to his own valuation.

Q. Will you give us in a little more detail the valuation amounting to $1,454,664.00 which you have placed upon this plant?

Mr. **Mathewson**: Let me see. I would like to ask a question in advance, whether I understand that the valuation that *you* placed upon this property is $1,454,664.00?

A. It is.

By the **Master**:

Q. And the statement you are about to present is a detailed statement of your own figures, which results in the aggregate to that sum?

A. It is.

By Mr. **Burr**:

Q. Now, will you proceed?

A. I have visited every building and every piece of apparatus, for which figures are given, at least twice; and have checked the figures given by others and fixed my own at the same time.

Referring to apparatus visible from 1884, although liberal, my valuation of their structural cost is $1,706,294. The retort house——

4564 By Mr. **Mathewson**:

Q. What is that $1,706,294?

A. My valuation of the property in existence in 1884.

Q. Which is still in existence?

A. Yes, still visible and in existence; my valuation of that is $1,706,294. In this I agree with Rowland's valuation. The depreciation on this property is estimated at fifty years, since the retort house and the principal appurtenances to it were built in 1853, according to the testimony of Mr. Mayer.

The depreciation is .85 of 1 per cent., or 42½ per cent., giving $725,175 depreciation, and leaving a balance of $981,119.

There has been added since 1884, my valuation:

(71)	1 stack 24 benches 6s	$50,000	
(72)	4 stoking mach. (Bronder)	16,000	
(73)	1 stocking mach. (Bronder)	4,400	
(74)	1 stoking mach. (De Brower)	10,500	
(76)	1 Ross Drawing Mach	5,000	
(77)	3 Extra engines	700	
(87)	1 Isbell Porter scrubber	7,000	
(88)	1 Hunt Aut. Ry. (coke passage)	8,000	
(90)	2 sixty-ton Coal Hoppers	3,000	
(100)	Exhauster House App. (15th St.)	8,000	
(101)	2 fifty H. P. boilers	3,000	
	Total additions	116,000	
	Depr. 12 yrs. at .85 of 1%, say 10%	11,600	
			$104,400

4565 Yard & Holder pipe connections in 1906	$146,895	
In 1884	82,178	
Increase Value Yard Connections	$64,717	
Depr. 12 yrs. at .85 of 1%, say 10%	6,472	
		58,245
Holder & steel tank, 3,250,000 c. ft.	$225,000	
Foundation for steel tank	50,000	
		275,000
Coal Hopper Bldg.	$7,000	
Exhauster House, 15th St.	19,500	
Boiler House, 15th	3,400	
Boiler House, 15th, new (practically completed)	6,000	
		35,900
No depreciation.		
Total estimated present value of buildings and apparatus		$1,454,664

By Mr. Burr:

Q. You have not been able to make any examination of any other plants of the company for the purpose of placing a valuation on them?

A. I have had no time to do so.

Q. Although you stand perfectly willing and ready to do so?

A. I am.

Q. You have here a schedule, have you not, giving the valuation you have placed upon each piece of apparatus in this plant or station?

A. I have it here.

4566 Mr. Burr: This is all I can ask this witness with regard to the plant. I expect in an hour to have the mass of detail with the amounts tabulated and the results totaled, but I submit I have no more questions to ask him now upon the valuation of the plant, and Mr. Mathewson is at liberty to examine him with regard to that.

Cross-examination by Mr. Mathewson:

Q. You remember that it was assented that certain engineers should be permitted to examine the plant of the Consolidated Gas Company for the purpose of estimating their value, that being something like two months ago? You remember that, do you not?

A. I do not.

Mr. Burr: Objected to. I do not know what he desires to show by this.

Mr. Mathewson: You have gone into this complaint about not being able to see——

The Master: Objection overruled. Proceed.

Mr. PAGE: The objection is, I suppose, that the question assumes a fact that does not exist.

The MASTER: No ground of objection was stated.

Mr. BURR: I object to it as incompetent, irrelevant and immaterial, and because, as the Senator says, it assumes a state of facts which does not exist here.

Objection overruled; exception.

Q. You do not remember that?

A. As far as I remember, I most positively do not.

Q. Do you remember that any arrangement was made several weeks ago that several engineers named by the defendants might examine the plants of the Consolidated Gas Company and 4567 that the Consolidated Gas Company consented to that; do you remember that?

A. I remember——

Q. Do you remember that? That is the question.

A. I don't remember that specifically. I remember visiting the works about——

Q. That is not the question. I asked you whether you remembered that an arrangement was entered into by which certain engineers were permitted by the Consolidated Gas Company to examine the plants of the company for the purpose of making an estimate of values?

A. What engineers?

Mr. BURR: Do you refer to Messrs. Hough and Logan?

Mr. MATHEWSON: I had nothing to do with the naming of the engineers. I refer to an arrangement by which the defendants were entitled to send engineers to the plants of the Consolidated Gas Company, to inspect those plants for the purpose of testifying as to their value.

Mr. BURR: You need not examine this witness with regard to that. We concede that was the fact.

The WITNESS: That matter was arranged by counsel amongst themselves, and I have never had any definite statement from any of the counsel so far as I am individually concerned.

Q. You do remember that it was also arranged that the defendants' experts might have an opportunity to examine the books of the Consolidated Gas Company respecting the cost of gas, and so forth?

A. I do.

Q. And you were in charge there, were you not?

A. I was.

Q. And you were not appointed for the purpose of inspecting the plant in order to determine their value at that time, were you?

A. I was assigned in charge of the accounts distinctly.

4568 Q. Now, you subsequently came to Mr. Carter, did you not, several weeks ago and asked him for permission to examine the plants, because, you said, there were certain vouchers which you could not determine whether to charge to construction or to repairs or replacements until you examined the apparatus involved?

A. That was all related in a letter addressed to Mr. Burr.

Q. But in substance that was the fact, so far, wasn't it?

A. As near as I can remember, yes.

Q. And did not Mr. Carter tell you subsequently that if you would give him a list of the vouchers which you doubted, with the items which you had a question about, that you might inspect that apparatus to see where the application should be made; do you remember that, in substance?

A. There was a statement that there was a list required from Mr. Carter.

Q. Do you remember telling him at that time that you would not give him any list, the first time you discussed it?

A. I don't remember saying that I would not give him any list. I told him it would be a very difficult and very tedious operation, and had the vouchers sent to him.

Q. You did not at that time consent to give him any list?

A. I had the vouchers sent to him.

Q. You did not consent at that time to give him any list or to name the vouchers?

A. I repeat exactly what I have said to you, that I told him it would be very difficult indeed, because it involved a large number of vouchers, which were subsequently sent to him.

Q. Did you tell him at that time when this first came up, several weeks ago, that you would give him a list of the vouchers or that you would give him the particular vouchers to which question was made?

A. I never told him that I would give him a list, but, after
4569 consultation with Mr. Burr, I sent the vouchers to him.

Q. Don't you remember that subsequent to that conversation you were in Mr. Burr's office when Mr. Burr called me up on the telephone and asked why Mr. Marks could not inspect the plant, and weren't you informed that I told Mr. Burr that what we wanted was a statement of the vouchers which were in question, so that we could get which were doubted, and in that event you should be permitted to inspect the apparatus involved in those vouchers, to determine what their obligation should be? Don't you remember something like that?

Mr. Burr: I object to that, asking this witness to testify to a conversation between Mr. Burr and Mr. Mathewson over the telephone.

The Master: If he cannot answer the question he can say so.

A. Why, of course, I cannot answer it.

Q. Were you informed by Mr. Burr at that time that my position was that if you gave a list of the vouchers or told us which the items were that were questioned that you might inspect the plant as to those items? Weren't you so informed by Mr. Burr, in substance?

A. I recall Mr. Burr mentioned, and I don't know at that time mentioning the fact that this request had been made, and my reply being that the number of vouchers involved were so large and so numerous, being classifications of vouchers which required a general examination because they were general classification work, that it was impossible, and finally I think it was my suggestion that all of the vouchers of which we were in doubt should be sent down for Mr. Carter's examination, which was done, I think.

Q. No matter about that, you are getting ahead of the story. 4570 Weren't you informed that some days subsequent to that a conference took place in the office of the Master at which Mr. Burr was present and at which I was present, at which the same subject was brought up and that I repeated before the Master that if a statement was given of the vouchers to which objection was made, or if we were informed what they were, that Mr. Marks might inspect the plant to determine what their application should be? Weren't you informed of that?

A. I was not present at the time.

Q. Weren't you informed of that? Be good enough to answer the question?

A. I was not present at the time and I shall state what I have told you in a general way, but cannot recollect this specific instance as following the conversation you name.

Q. And after Mr. Burr informed you of the purport of this conversation before the Master did you not then request Mr. Hall to write and say that the vouchers to which exception was made were spread out on the table or were accessible to the Consolidated?

A. If Mr. Burr so directed me I certainly did.

Q. You did at any rate thereafter request Mr. Hall, you say, to write a letter stating what the vouchers were or where they could be identified, didn't you?

A. Why certainly I did.

Q. And don't you know that immediately after that letter from Mr. Hall was received that you went and found the vouchers, hundreds of them, perhaps a thousand, and spread them out on the table and we were told that those were the vouchers?

A. That was a matter of Mr. Hall's.

Q. Isn't it your information that that was done?

A. I saw those vouchers, I think, I cannot swear to it posi- 4571 tively, resting on either Mr. Carter's or Mr. Addicks' table in the office of the Consolidated Gas Company.

Q. Weren't you informed that in spite of the fact that no specific vouchers were pointed out in that thousand vouchers that the Consolidated Gas Company was instructed by me to waive all technicalities and let you examine in reference to the whole thousand?

A. No, I was not.

Q. At any rate you were permitted thereupon to make an investigation?

A. Through the kindness of Mr. Addicks, yes.

Q. Now, when you say you were a member of the Advisory Board of Engineers, who appointed this Board of Engineers, or who constituted them a Board?

A. By direction of the Corporation Counsel that Board was named and approved.

Q. It had no official existence except as it was appointed by the Corporation Counsel, had it?

A. No, they were on the same footing as the accountants.

Q. Now, as a matter of fact, you found an item of $282,000 which was charged to depreciation, you say, of mains in 1905, which you reduced by something over $59,000, on the ground that there were certain mains which should have been charged off in 1903 and 1904 included in the amount, is that right?

A. The accountants said so, with the approval of the Advisory Board of Engineers.

Q. You approved it?

A. I did, as a member of the Board.

Q. Do you know whether in fact those mains were abandoned before 1905?

A. The accountants' statement was accepted by the Board.

Q. Do you know anything about it except what the accountants said to you?

A. What they stated on the record, that was all.

4572 Q. Do you know anything about it except what the accountants said about it?

A. What they stated on the record is all we know, and we believed that.

Q. If, as a matter of fact those mains were a proper asset of the company and were considered to be a proper asset in 1903 and 1904, there was no reason why they should have been charged off earlier than they were, was there?

A. That is purely an academic question.

Q. You cannot answer it?

A. No.

Q. And if they should have been charged off in 1903 and 1904 instead of 1905, then it would swell, of course, the depreciation charge for 1903 and 1904 to a corresponding amount?

A. It would.

Q. When did you begin the examination of the 14th Street plant?

A. The early part of last week; I am not exact on that statement; I would have to look it up to be certain of the day.

Q. Cannot you tell the exact day, try to think?

A. No.

Q. Try to think and let me know, as nearly as you can recall what day you began?

A. Not without reference to my notes, which are not here.

Q. Will you get your notes so you can tell what day and hour, as nearly as you can, you began this examination?

A. This afternoon, yes.

Q. When did you complete it?

A. Practically finished it last Saturday afternoon.

Q. Do you mean to say that within that period you made a complete inventory of the 14th Street plant?

A. A complete inventory, alleged, was furnished us by the Consolidated Gas Company.

Q. The inventory that was furnished you was the inventory made by Mr. Mayer, one of the witnesses for the complainant, was it not?

A. I don't know who made it. There were no figures attached to it.

Q. Were you not informed who made it?

A. I was not. It was in wretched shape, a jumble.

4573 Q. Too bad we were courteous enough to give it to you, if it was so bad. You say that from a catalog furnished by the Consolidated Gas Company an inventory was drawn off. What catalog was that?

A. There was a bunch of seven papers—of eleven papers handed to us, one to Mr. Burr, which has since disappeared——

Q. You do not charge us with taking that I suppose?

A. It was impossible to do anything with it in that shape and it was then drawn off in the proper form of a bill of sale or inventory.

Mr. MATHEWSON: I move to strike out the word "proper."

Mr. BURR: Well, in the form of a bill of sale.

The WITNESS: In the form of a bill of sale or inventory, for the purpose of using it.

Q. Is this the document you now show me?

A. That is the document.

Q. What was the catalog which you referred to? Was it the inventory which Mr. Mayer used?

A. No, indeed. Mr. Mayer would not have furnished anything like that.

Q. Were the catalog and inventory which were furnished by the Consolidated Gas Company identical, or what was the distinction?

A. The catalog only was furnished; there was no inventory in the proper sense of the word, completed in figures.

Q. What I am getting at is, were there two documents delivered to you, one a schedule of the property at 14th Street and the other a catalog or do you refer to the same papers when you use inventory and catalog?

A. When I speak of the Consolidated Inventory or catalog I mean one and the same paper.

Q. Well, you have not so spoken of it before. You do
4574 mean one and the same paper, do you?

A. Yes, which has no figures upon it.

Q. In other words, this catalog or inventory was a list or purported to be a list of the property at 14th Street as the Consolidated had it from Mr. Mayer, did it not?

A. I don't know how the Consolidated had it.

Q. Well, as the Consolidated had it, to put it that way?

A. As the Consolidated had it, yes.

Q. Did I understand you to say $1,454,000 was a figure arrived at by consultation of the gentlemen named by you and also by examining Mr. Rowland's figures?

A. I stated that——

Q. Was my understanding correct?

A. No.

Q. Well, it was not then reached by conference between you gentlemen, is that right?

A. It was not reached. They are my own figures.

Q. Did you value the iron work yourself?

A. I did.

Q. Did you value it independently of Mr. Logan?

A. I checked every one of Mr. Logan's figures and——

Q. Did you agree with Mr. Logan in every instance to a cent?

A. I did not.

Q. In this $1,454,000, so far as it includes property acquired since 1884, are not your figures identical in every instance with Mr. Logan's figures for the same items?

A. No, except in the case of holder and steel tank, the $225,000 fixed by Mr. Logan, being checked, was adopted by me.

Q. Did you not adopt his estimate of $50,000 for foundation for steel tanks?

A. I did not. I figured that myself.

Q. What do you mean by "Logan est." after "foundation for steel tanks," followed by the figures $50,000?

A. The typewriter put that one line too low.

Q. Ought that then to be opposite holder and steel tanks?

A. Yes.

4575 Q. What was Mr. Logan's estimate for the foundation for the steel tank referred to?

A. He did not make any estimate, stating that it was a very expensive foundation, merely.

Q. Will you point out any other item specified here which was not in existence in 1884 which Mr. Logan valued and which you have valued at a separate figure?

A. I do not see any item in that inventory which was valued by Mr. Logan subsequent to 1884 where I specifically gave a great deal of attention to his work; it was the holder which I understood he was a builder of which commanded my attention.

Q. Will you point out any one of the items which you have valued as added since 1884 here where your valuation is different from Mr. Logan's, if Mr. Logan made a valuation of it?

A. In the items shown there, there is nothing which I can find which relates to Mr. Logan's work or refers to it, excepting the holder. $225,000.

Q. Then that is the only item that you find that you took Mr. Logan's valuation as he gave it?

A. Checked it and took it.

Q. Now, so far as the property which you think existed in 1884 and which still exists is concerned, you took Mr. Thomas F. Rowland's valuation of 1884?

A. Yes, after checking it.

Q. And you figured depreciation of $725,175?

A. Yes.

Q. How do you know that the apparatus which you had in mind and included in that and the property in general is exactly the same now as it was then?

A. Well, the names of things is a matter of common consent, and I find them in the same spot.

Q. Did you have any information as to the measurements of these different pieces of apparatus by Mr. Rowland except what appeared on the schedules in evidence as showing Mr. Rowland's appraisal? 4576

A. I have no further evidence than the statement made in Mr. Rowland's appraisal.

Q. Do you know whether any part of that apparatus has been renewed or replaced since 1884?

A. I assumed that a great deal of it had been repaired.

Q. You found the apparatus working, didn't you?

A. Yes.

Q. And still you take off $725,175 of depreciation out of the $1,706,294, total valuation. Is that correct?

A. Yes.

Q. If parts of the apparatus have, from time to time, been renewed, then a new life starts for that apparatus, doesn't it?

A. You mean repaired?

Q. I mean renewed or repaired?

A. Why, yes.

Q. And then the 50-year life which you assume, or whatever life you have assumed would not apply as dating from 1884 would it?

A. To the apparatus as a whole.

Q. Yes.

A. Yes, it would.

Q. Would it to those particular items?

A. To the particular repairs, no.

Q. What life did you assume for this apparatus?

A. The retort house was built in 1853——

Q. What life did you assume for it?

A. And I assumed a life of 50 years.

Q. Then the life would have expired three years ago. Did you give any valuation for it at all now?

A. I beg your pardon?

Q. Then the life would have expired three years ago, if you gave a life of 50 years and it was built in 1853?

A. I misunderstood you, I don't think I answered your question correctly. You asked me what life I assumed, for instance for a retort house?

Q. Yes. I will ask you that.

A. If you will take the annual depreciation of .85 of one per cent. which applies to a building or a piece of apparatus kept in perfect repair, you will find that that will give a life of about 110 years, by dividing it. 4577

Q. Are not the retort house walls apparently in perfect condition to-day so far as substantial strength is concerned?

A. Indeed no; in many cases the brick is in very bad shape.

Q. It looked to you as though it were about to fall down, or anything of that sort?

A. Oh, no, just crumbling away.

Q. What is it made of?

A. Brick and iron.

Q. And if any part of it starts to tumble, I suppose new brick can be substituted, can they not?

A. They can.

Q. That would be a repair, would it not?

A. Yes.

Q. Were not the other buildings in use and supporting the apparatus which they were designed to support?

A. What other buildings?

Q. Fourteenth Street plant.

A. Some of the substantially built buildings were in good shape and others mentioned in the inventory were simply wrecks; the sheds more particularly.

Q. Oh, the sheds?

A. Yes.

Q. Wooden sheds?

A. For instance the shed with the stack, the stack was truncated at a height of about four feet above the ground and the shed itself was standing in all sorts of shapes.

Q. That was the wooden shed, was it?

A. No, there was corrugated iron and there was a wooden roof and there is either tin or tarred paper on top of it, and there was a brick wall on the outside of it and——

Q. Did you go through each one of these pieces of apparatus and make your estimate for the depreciation for each individual piece?

A. I am talking of the buildings. You mean——

4578 Q. I am referring to the whole property, buildings, apparatus and other property. Did you go to each individual piece of apparatus and make a separate estimate of its condition so far as each particular piece was concerned, as Mr. Mayer did in his testimony?

A. Will you allow me to explain how I did depreciate each piece?

Q. No. I want to ask you that question and have it answered. It is simple, I think.

A. I examined each piece with a view to depreciation.

Q. Did you set a depreciation upon each piece of property in making up your estimate?

A. You mean each building?

Q. I mean each individual piece of property separately, as Mr. Mayer did.

A. In the case of figures given by Mr. Rowland, I am liberal enough to assume that it has been kept in perfect repair and gave a depreciation due to inadequacy and obsolescence.

Q. You found that Mr. Yalden testified in 1884 that the property was virtually as good as new?

A. As I assumed myself, in my depreciation, that the property has been kept in perfect repair.

Q. Now let me repeat the question: Did you go over each individual item of apparatus and property and set opposite each item the amount of depreciation for that particular item as you found it exists, and if so, will you produce the memoranda which you so made?

A. In the case of buildings——

Q. Can you not answer my question yes or no?

A. Certainly, I did not go over every piece of property and put down depreciation.

Q. Now, Mr. Rowland's testimony was as to the value of this property in 1884, as you understand it?

A. Yes.

Q. And your testimony at present, if you adopt his figures, would be upon the basis of the valuation of 1884, would it not, so far as the property still remains?

A. So far as I have used his valuation, yes.

4579 Q. Where is the balance of your estimate beyond the $981,119 which is Rowland's valuation less your assumed depreciation? You took what value, the present value?

A. I took entirely my own estimate and checked out by comparison with Mr. Mayer more particularly and——

Q. The present value or what value?

A. The present value.

Q. The cost of reproduction now?

A. The actual structural cost.

Q. So that even assuming that you are right regarding the existence of the property in 1884 which you assume to exist now, your total does not represent the cost of reproduction now, but is a conglomerate made up of the cost in 1884, or the value at that time as estimated by Mr. Rowland, plus the present value of the balance of the property, is that right?

A. I would say that is about it.

Q. And when you use the term "structural cost" in your testimony, that is what you mean, is it, so far as this total of $1,454,000 is concerned?

A. I mean to give the valuation of an intending purchaser intending to operate the works in $1,454,664.

Q. How did you estimate the value of the iron work in the various heavy pieces of apparatus where the value depends upon weight as one of the items?

A. For instance in the case of tar scrubbers, there was a concurrence or agreement as to weight between Mr. Mayer and Mr. Rowland and also Mr. Logan. We had no time to rework these weights, we had to accept the figures given by Mr. Mayer and——

Q. What did you assume to be the weight of the tar scrubbers?

A. I have not Mr. Mayer's figures here.

Q. What did you assume to be the cost per pound of delivery of those delivered?

A. I would have to look up my notes to answer that question.

4580 Q. Did you make any assumption?

A. Yes.

Q. How did you make up your price per pound, what were the details of that computation whatever it was?

A. You refer to the price per pound for what?

Q. Tar scrubbers?

A. If you want, I can give *give* you those figures this afternoon. I have not got them with me.

Q. You have not bought or installed any apparatus yourself other than as you have testified in your original examination, have you, Doctor?

A. Do you mean iron?

Q. Gas apparatus. Have you had any experience, in other words, in the purchase of apparatus or construction of gas apparatus since your original testimony here?

A. Why, no, but you are speaking of purchasing iron.

Q. Well, scrubbers are iron, are they not?

A. Yes.

Q. That is quite right. I asked you——

A. But all iron is not scrubbers.

Q. I asked you what you estimated to be the weight of those tar scrubbers and what you estimated to be the price per pound delivered, and I would like to have the price per pound itemized so as to see how you made that up, referring to the price of the iron and the labor and so on?

A. Referring to the weight, I told you that I had accepted the figures given accordingly by Mr. Mayer and Mr. Rowland; referring to the price per pound, if you wish I will give you that this afternoon.

Q. I can tell whether they agree, the figures of these two gentlemen, when you say what they are. Let us take one stack, 24 benches, 6's; what did you put that in at, $50,000?

A. That is put in as $50,000.

Q. Present value?

4581 A. Present value. It is new, to all intents and purposes, a new stack. Mr. Mayer's figures are $49,980.

Q. Then why down below do you take off depreciation 12 years at .85 of one per cent., say ten per cent., $11,600, which is a deduction from the one stack of 24 benches as well as all the other property in that house?

A. Will you allow me to explain the method of depreciation?

Mr. Burr: That is what he asked for.

Q. I asked you why you take it off if you say that stack of benches is as good as new?

A. In all cases of depreciation I use the word with its accurate meaning, of a lowering of value. Depreciation results from several causes. The most ordinary one is decay or wear and tear, as observed. There is another factor which is inadequacy, owing to the increase of the business. There is also another cause of depreciation, obsolescence, which is due to changes in the arts and in the methods and in the general growth of scientific knowledge; if a works built at a certain period is kept in perfect repair, meaning by that, always restored to their original condition, and in good working condition, there remains, assuming that, a depreciation due both to obsolescence and to inadequacy, and that is this depreciation which I have given you here of .85 of 1 per cent. annually.

Q. That is entertaining, Doctor, but you stated a few moments ago, that these items in addition to the $981,119 represented the cost of production now, and you put one stack, 24 benches, $50,000?

A. Yes.

Q. And you say that is as good as new?

A. It is being reset.

Q. It was reset in 1906, wasn't it?

A. Being reset now.

Q. As good as new, very good. Now, the four stoking machines, you put down at $16,000? 4582

A. Yes. $16,000.

Q. And that is exactly the cost as given by Mr. Mayer, is it not?

A. Mr. Mayer's figure was $15,200.

Q. No, that is the $16,000, which he gave as the cost, less five per cent. depreciation, or $15,200?

A. Yes.

Q. Your valuation new is exactly the same as his?

A. Exactly, and I assumed them to be in perfect repair.

Q. Your next item, one Brouder stoking machine, $4,400, I see is exactly the same as his estimate?

A. Yes.

Q. One De Brower, $10,500, your estimate I see is exactly the same as his estimate new?

A. Yes.

Q. Your next item one Ross drawing machine, you give a valuation of $5,400, in which you are exactly the same as Mr. Mayer?

A. In which I agree with Mr. Mayer.

Q. The next is three extra engines?

A. Yes, small engines.

Q. $700?

A. I agree with Mr. Mayer there, it is $705 on his.

Q. One Isbell Porter scrubber $7,000. Mr. Mayer's estimate is $6,860 without depreciation?

A. Yes, I practically agree with him.

Q. The next one is Hunt Automatic Railway, $8,000. Do you agree with Mr. Mayer on that?

A. Practically. I am slightly less than his.

Q. Yes, his is $8,075.

A. $8,059.

Q. That is after depreciation of 2 per cent. is out, the $8,059. Two 60-ton coal hoppers, $3,000. His estimate was $3,315 wasn't it?

A. Yes.

Q. How many pounds did you assume there were in those hoppers?

A. These 60-ton coal hoppers?

Q. Yes.

A. How many pounds of what?

Q. How much they weighed?

4583 A. Well, they are very large structures, and they are up at the upper end——

Q. That may be, but what was your estimate of weight in your computation?

A. I will figure that out and bring it along for you.

Q. Did you figure that out before?

A. Yes, in a general way. Of course you understand you cannot walk around works——

Q. I understand, but I wish you had your memorandum with you, it would have saved me some trouble. What were the hoppers made of?

A. They seemed to be a composite arrangement.

Q. Describe them as nearly as you can.

A. They were covered with dirt and pyramidal in shape and came down to a point where they were able to dump coal, that is about as near a description as I can give.

Q. How were they sheathed?

A. That would be difficult to say.

Q. You did not find that out?

A. You could not in the time allotted.

Q. And you did not, of course?

A. No.

Q. Do you know whether——

A. However, I did not suppose——

Q. Do you know what the thickness of shell was?

A. In that case?

Q. Yes.

A. Well, I looked at it. I can tell you from my memorandum what I thought it was. As I do not differ with Mr. Mayer at all in the matter to amount to anything——

Q. His valuation is $3,315 new?

A. And mine was $3,000, there is about 10 per cent. difference between us.

Q. Take the exhauster house apparatus, 15th Street?

A. $8,000.

Q. Is that the same as Mr. Mayer's?

A. It is a little over his.

4584 Q. Two 50-horse-power boilers following you put at $3,000?

A. Yes, and I see Mr. Mayer's figure is $3,094.

Q. Do you know whether the amount you took off for depreciation was as great as Mr. Mayer's or less?

A. Somewhat greater.

Q. So that speaking generally, of the items which you valued as added since 1884 and which make all of the $1,454,664, with the exception of the $981,119 which you attributed to 1884 apparatus, your figures are the same as those of Mr. Mayer where he valued it?

A. To all practical purposes, on the structural cost. I am in agreement with Mr. Mayer. Will you permit me to call your attention——

Q. Let me ask you another question. You did not make any estimate of the present cost of reproduction of the property which was in 1884 and which you assumed to be still in existence and which you valued at $1,706,294, original cost, did you?

A. I did not. I estimated its present value.

Q. Have you the details of your valuation here, showing item by item what the values were?

A. These that I have here are only rough memoranda. The details which I have handed you over there—may I add one thing?

Q. No, this does not give the details of the valuation amounting to $1,706,294 for the 1884 apparatus.

A. May I make a correction here now? In looking over these details, I think that I omitted to put in four small purifiers, $16,000.

Mr. PAGE: That is without depreciation?

The WITNESS: Depreciated 10 per cent., net $14,400, making the total valuation $1,469,064.

Q. Now, Doctor, I would like to have you give me the schedule or memoranda showing in detail the items which you included in the $1,706,294 valuation?

A. I will try to explain that to you——

4585 Mr. MATHEWSON: I do not care to take the space to spread it on the record.

Mr. BURR: Does that appear in your schedule?

The WITNESS: The first column of my comparative schedule is a reproduction of Rowland's valuation of 1884 as given on pages 818 to 825, Senate Document 47, 1886.

Mr. BURR: And which is in evidence here?

The WITNESS: And which is in evidence.

Mr. BURR: Introduced by the Complainant?

The WITNESS: Introduced by the Complainant.

Q. Have you not made a memorandum of that and opposite placed your values making the $1,706,294? Have you not drawn it off and cannot you give me a list of that so I can see just what property you include in the description?

A. All the property given by Rowland in the first column. There are matters I would not like to have anybody see except you, Mr. Burr, on this. I will, if you like, tear off this and this, and put it in.

Mr. MATHEWSON: We have the Mayer and Rowland and Logan values in. If there is anybody not already in evidence, tear that off. There is no objection to my having those, is there?

The WITNESS: I would prefer you should not have these.

Mr. MATHEWSON: I do not care for those. All I care for is the list of the property——

4586 The WITNESS: There is one of them (handing paper). I will give you the next.

Q. Well, but you have not got your values in here in all these cases as to this apparatus?

A. I will give you this (handing another paper). Those are Rowland's valuations which have been gone over by me and accepted or——

Q. But in many items, Doctor Marks, there appears to be no valuation opposite?

A. It did not exist in that case.

Q. You mean the apparatus did not exist?

A. The apparatus or building did not exist at that time.

Q. Then you have not included any values for apparatus in Mr. Rowland's exhibit that you do not find now existing?

A. Oh no, I accepted Mr. Rowland's exhibit as a whole.

Q. Do you mean to say in Mr. Rowland's exhibit there are certain buildings or other property included and valued which did not exist then?

A. There are certain buildings omitted from Mr. Rowland's exhibit or inventory which were not in existence in 1884, but are in existence now.

Q. And you have valued those separately?

A. And I have valued those separately, accepting Mr. Rowland's as a whole, after going over it with a great deal of care and checking it out.

Q. I understand these two sheets that you have given me are the items making up the total of $1,706,294?

A. They are, yes.

Mr. Mathewson: I will ask to have those marked for identification, so if I should use them later, they can be identified.

Paper marked Complainant's Exhibit 257 for identification.

Mr. Mathewson: I have a few more questions as to these items since 1884, and I will ask you to bring your details this afternoon, and I will postpone my conclusion, as I cannot proceed without them. I shall be very brief then, I think. 4587

Recess until 2.15 P. M.

After Recess.

William D. Marks resumes the stand and further testifies:

The Witness: During lunch time I have re-worked the holder foundations which was an item of $50,000, and two tar scrubbers, an item of $42,706, and I am prepared on those two. On the hopper there are so many figures; it needs so many different kinds of wood and iron that it requires an engineer's pocket book and an hour or two this evening to prepare that.

Cross-examination (continued) by Mr. Mathewson:

Q. My question was whether you actually worked out these values that you gave in advance, with your weights and prices per pound before you and whether you examined and found out what the character of these items was; for instance, what kind of iron or steel was used; whether before you testified this morning you had made an examination?

A. Oh, yes.

Q. As to each particular item, and figured it out in detail?

A. Yes. You must recollect I have been at this sort of job thirty-five years.

Q. When you spoke about your not knowing this morning what the hopper was sheathed with, you said it was covered with dirt?

A. On the outside.

4588 Q. Well, a hopper is away up in the air isn't it?

A. Yes.

Q. And the dirt to which you referred was the ordinary soot or blackening of a gas works, wasn't it?

A. Everything—dust, coal dust, cinders and everything else.

Q. And you did not take occasion to mount and examine and scratch the sheathing to find out what it was made of?

A. No, I accepted Mr. Mayer's statements as to materials and checked them roughly.

Q. Now, in reference to your figures for the holder, 3,250,000 cubic feet capacity, respecting which you accepted Mr. Logan's valuation of $225,000——

A. For the iron.

Q. (Continuing.) ——Instead of Mr. Mayer's valuation of $262,224 for the value of that holder new, everything included, did your $225,000 include the iron work of that holder proper alone?

A. The $225,000 included the steel tank and the holder, but not the foundation.

Q. What did you take to be the weight of that holder, including the tanks and pipes, in making that computation?

A. In that matter I left it entirely, the weights, to Mr. Logan, and checked by dividing the capacity into Mr. Logan's price.

Q. You assumed his weights?

A. I accepted the weights without question.

Q. You did not make measurements yourself of length, breadth and thickness of the parts from which you might compute the exact weights?

A. I accepted Mr. Mayer's length, breadth and thickness without criticism.

Q. But Mr. Mayer did not state what the thickness was in the description which you have of that item, did he?

A. It was not necessary to know the thickness because I accepted Mr. Logan's figures in that matter.

4589 Q. You accepted his estimate without special measurements on your own part?

A. I did.

Q. And did you know what pressure that holder threw?

A. I did not ask.

Q. What price per pound, including the value of the permanent frame, did you assume in computing the value?

A. I did not ask, I accepted Mr. Logan's figures and made a capacity check.

Q. You have valued the foundation for steel tank at $50,000 and have stated that those are your figures, and not Mr. Logan's estimate?

A. I have.

Q. How many yards of excavation did you allow?

A. Excavation?

Q. Yes.

A. 200 feet diameter, 8 feet deep, 9,309 cubic yards at fifty cents; $4,654.

Q. The excavation you fixed then at only $4,654?

A. $4,654.

Q. How much per yard did you allow for taking that dirt out?

A. Fifty cents.

Q. Do you mean to say you allowed only fifty cents for taking it out and taking it to the dump and disposing of it?

A. I do.

Q. You have not done any contracting of that sort in the City of New York recently, have you?

A. I have not.

Q. Did you allow for any piles under that foundation?

A. 3,000 piles at $7.50 each, driven; $22,500.

Q. That was the sum that Mr. Mayer allowed for piles, wasn't it?

A. I thought Mr. Mayer's price was $5.00. I do not know.

Q. No, $7.50. How much concrete did you allow for?

A. Six inch concrete, 150 feet diameter, circle in centre, 327 cubic yards.

Q. 327?

A. 327 cubic yards; 2 foot ring, 21 feet wide around the outer edge, 847 cubic yards. Then in place of the brick wall I allowed——

4590 Q. Wait a minute. How many yards of concrete, all told?

A. One thousand five hundred yards of concrete, all told.

Q. You did not measure the amount of concrete, did you, but accepted the figures of Mr. Logan in that regard?

A. I accepted Mr. Mayer's figures.

Q. As to the number of yards of concrete?

A. I did not, as to the dimensions of the foundation.

Q. In the retaining wall how many thousand brick did you allow, and at what price?

A. I assumed a two-foot concrete wall for that, allowing 326 cubic yards, assuming that the cost would be the same.

Q. Well, how much did you allow then for the cost, for the concrete instead of brick?

A. At $7 per cubic yard; $2,282.

Q. Well, Mr. Mayer's figure is $3,750 of brick and you were not then reproducing the foundations exactly as they now are, were you?

A. Mr. Mayer estimates brick work at $25 per thousand laid. To me that appears to be an overestimate, at the present rates.

Q. You estimated concrete instead of a brick wall as it exists?

A. Yes.

Q. How about the blue stone coping? How many feet, and at what price?

A. I let that go along with the extra thickness of the concrete wall.

Q. Mr. Mayer's estimate of the blue stone coping was 390 cubic feet at $3.50, so that the retaining wall and the coping together, according to his estimate, amount to over $5,000?

A. Yes.

Q. And for both you allowed $2,250?

A. Yes; for both $2,282. About one half of it.

Q. How deep did you figure the excavation?

A. I took an excavation at about eight feet since the wall was carried down to a depth of seven feet.

4591 Q. Does that make up your exact total of $50,000?

A. Oh, no. The total is as follows:

Piling	$22,500
Concrete work	10,500
Excavation	4,654
Total	$37,654

Allowance to contractor for profit and contingencies, the difference between that and $50,000.

By the **Master**:

Q. About what per cent. is that which you allow for contractor and contingency?
A. About 33 per cent.

By Mr. **Mathewson**:

Q. Have you ever done any excavating on the Island of Manhattan?
A. No.
Q. Never constructed anything on the Island of Manhattan?
A. Never. I have the two tar scrubbers if you care for them. They are an important item.

Mr. **Mathewson**: That is all.
Mr. **Page**: I would like to ask Mr. Marks one or two questions as to the plants.
Mr. **Burr**: I have no objection to your asking a question.
Mr. **Mathewson**: I have another question or two.

By Mr. **Mathewson**:

Q. Your investigation discloses that Mr. Mayer had prepared his valuations with great thoroughness, didn't it?
A. Of the structural cost.
Q. And in regard to the valuations for structural work you substantially agreed with him? 4592
A. With him; and I think most of the others did, except in the case of the gas holders.

By Mr. **Burr**:

Q. I do not want to dwell at any length upon this question about the vouchers, but as a matter of fact was not the situation this: That when a period arrived that the accountants, acting with the Board of Advisory Engineers, were unable to ascertain from certain vouchers themselves what way they had been charged up in the books of the company and whether they were properly charged to one account or another, it was deemed advisable to have an inspection of the plants for the purpose of ascertaining the method adopted by the company in that regard; that is, whether these repairs of a certain kind were really construction, or should be charged really to construction instead of to operating account; is that the fact?
A. That is the fact. We wished to learn of the disposal of that material.

Q. Whether it was in the plants themselves on storage in the storerooms, or whether it had been used in the plants, actually used?

A. Yes.

Q. And for that reason a certain number of these vouchers were set aside for the purpose of having Mr. Carter or some other officer of the company examine them?

A. Yes.

Q. As they had expressed a desire to examine them?

A. Yes.

Q. And finally that having been done it was arranged with Mr. Addicks that a quick inspection of the plants should be had for the purpose of observing the manner in which those repairs or materials were treated?

A. Mr. Addicks took us to see not the generating plants, but two of the shops—the meter shop and one of the jobbing shops.

4593 Q. And in that way gave you a general view of the system adopted by the company in treating these repairs?

A. Yes.

Q. Now, the fact that at this late day you are called as an expert to testify as to the value of the plant arises quite unexpectedly, does it not?

A. It does.

Q. It was not intended that you should testify, and you heard me so state a long time ago at one of these hearings, did you?

A. I did.

Q. And the idea was that you were to act in an advisory capacity with the accountants as it was then stated?

A. It was.

Q. And the fact you are here now testifying is due to the fact that one of the experts called by the State was not accepted by them, as you understand?

A. It is as I understand.

Q. So that there has been no neglect or delay on your part in doing any duty that was assigned to you to do?

A. None whatever, so far as I have been able in the time permitted.

Q. You have stated the amount of depreciation which you have allowed upon the 14th Street plant. Will you be good enough to state upon what you state that depreciation and how you arrive at it?

A. First of all, I did not assume the attitude of an engineer, but that of an intending purchaser wishing to purchase the plant and to continue to operate it, believing that to be the attitude in which the company to-day is. It would not in that case be fair to assume the actual structural cost of the gas works going back so many years, regardless of depreciation, or, on the other hand, to assume the scrap cost of the works and stock, and the buildings and apparatus idle, without intention to make further use of them.

4594 Q. Now, you say you have not estimated the actual structural cost of the buildings and apparatus, nor have you estimated the scrap cost of the abandoned works. On what basis have you estimated the present value of these works?

A. On the basis of the structural cost, less actual depreciation.

Q. Then how have you determined the depreciation?

A. In determining the depreciation in the correct sense of the word, the first consideration would be the visible decay of the apparatus due to wear and tear. The second consideration would be its adequacy or inadequacy to the purposes for which it is used to-day; and the third consideration would be its obsolescence, meaning by that the methods of manufacture and the methods of transmission of power, the general changes, and the growth of technical knowledge as applied to gas making, the progress of the business since the design and building of the works and whether or no the works are kept up to date.

Q. Can you give me an example of the depreciation due to decay and wear and tear?

A. Yes. For instance, a brick building with a slate roof might have its life fixed at 100 to 120 years. Although kept in perfect repair all the time, still the decay and the changes of time would probably have made it earn its cost in the time mentioned and warrant its replacing, because of the apparent wear and tear, the rusting of the trusses, the decay of the bricks, the movements of the foundations, although all the time every repair that was possible might have been done to it.

Q. Is there anything more you desire to say on that point?

A. Regarding the depreciation due to decay I would also mention the case of a boiler. It is usual amongst engineers to assume the life of a boiler kept in perfect repair to be somewhere in 4595 the neighborhood of fifteen years, although this life will very largely depend upon the quality of the water which is used in it and the severity of the services required of it.

Q. Will you give a case of depreciation due to inadequacy?

A. In his testimony Mr. Simpson states that at present the Consolidated Gas Company does not lay down any mains less than eight inches in diameter and that for many years he has not laid any mains less than six inches in diameter, in a street in Manhattan. For this reason it would appear as though the one and one-half inch, the two-inch, the three-inch, the four-inch and five-inch mains were regarded by the Consolidated Gas Company as being inadequate for the demand of the present day. Ultimately they will have to be abandoned and the mains depreciated by the cost of these small mains.

In the case of the retort house the water appeared to be within six feet of the floor level—of the retort house floor, preventing deep excavations. The roof of the retort house is so low that the present benches reach very nearly up to the trusses, that is to say, to the bottom of the trusses; and, therefore, if larger benches than the present direct fire six retort benches are required, such as are now being used—I mean the regenerative benches, with a larger number of retorts of about twice the total height, it would be necessary to raise the roof of the retort house fifteen or twenty feet before putting them in. The present retort house is inadequate to the needs of the manufacture of coal gas up to the present date; that is, after the methods of the present day.

It is obvious also that many of the smaller holders occupy much more ground and give very little capacity and they are not adequate and will have to be abandoned and replaced by larger holders suited to the needs of Manhattan to-day and its business.

4596 Q. Now can you give me an example of depreciation due to obsolescence?

A. Yes. At various points in the 14th Street Works are located small and inadequate engines and steam boilers used for the purpose of pumping, or grinding coal or handling coke and operating coal handling machinery. There is but one gas engine in use for these purposes. These little old steam engines and boilers are extravagant to the last degree in their use of coal and heating, taking ten or twenty times as much as an economically designed gas engine or a large condensing steam engine. These small steam engine boilers are obsolete because they should all be replaced either by gas engines or electric motors operated by a generating station, driven by economical gas engines or steam engines of a large size.

Q. And it appears to-day there are other factors than mere decay and wear and tear entering into depreciation. Does Mr. Mayer appear to have taken into consideration anything else than decay in his depreciation?

Mr. **Mathewson**: Objected to. Mr. Mayer has testified and what he took into account his testimony shows. I do not think the witness can characterize it.

The **Master**: That seems to be a valid objection, Mr. Burr.

Mr. **Burr**: I think he can say from his experience——

The **Master**: You can say that in your brief.

Q. Well, does Mr. Mayer's depreciation appear to be small, even if based on that factor alone?

A. Mr. Mayer's depreciation, even if based on decay alone, appears to me to be small.

4597 Q. Assuming the existing works to be kept in perfect and thorough repair, covering all decay and wear and tear that occurs, would the buildings and apparatus in your opinion still be subjected to a depreciation?

A. Yes, there is still a depreciation charge due to inadequacy or obsolescence. It should be averaged as a percentage of the structural value of the works and written off every year.

Q. In the books of the company during 1905, what did you observe as to depreciation?

A. During that year the depreciation fixed by the Board of Direcfors on January 30, 1906, appears to correctly amount to about $1.71 per one thousand cubic feet of gas, or about .85 of one per cent. of the structural cost of the works, the whole works, actually, while the works themselves appear to have been amply repaired in the operating portions used for the purpose of generating gas.

Q. When you say that $1.71 appears to .85 of one per cent., upon what figure per thousand structural cost do you figure that?

A. $1.71 per thousand cubic feet of gas is placed against $2.00 investment per annual thousand cubic feet of gas and makes .85 of one per cent. on $2.00.

Mr. **Burr**: Now, if you want to ask any questions with regard to the 14th Street plant, Senator, I have no objections.

By Mr. **Page**:

Q. Do I understand, Mr. Marks, that you took the valuations in the Rowland inventory as they are stated and set them down upon this schedule which you prepared?

A. I did.

Q. And you accepted that valuation as the basis upon which you would figure your depreciation?

A. I made a rude check of the scrap sum stated by Mr. Rowland in 1884, and on finishing that check, item by item, it appeared 4598 to me a very liberal valuation, but at the same time a consistent one which I could accept, subject to depreciation.

Q. And I do not suppose that you refigured that entire inventory, did you?

A. It was out of the question. No mortal living could do it in the time allowed.

Q. And was the same true of the statement of values as given by Mr. Mayer?

A. It is. Mr. Mayer does not differ largely from my own figures of structural cost. You may say for all ordinary purposes they coincide, with the exception of the gas holders, and even there they do not differ largely. It is the question of depreciation entirely.

Q. Assuming some of the dimensions given by him to be correct and the prices per unit as given by him to be right you arrive at substantially the same result?

A. Yes, sir.

By Mr. **Burr**:

Q. Now, Doctor, we will take up the subject of the mains. I understand you made a very careful examination of the maps of mains which are on file in the office of the Consolidated Gas Company?

A. I have.

Q. Those maps, as I understand, show the mains in all the streets as they exist in the Borough of Manhattan?

A. They do.

Q. You have accepted as being correct the statement with regard to the mains in the Borough of The Bronx?

A. I have, that is the value of the mains in the Borough of The Bronx.

Q. Now, will you be good enough to state what was the nature of the examination you made and what was the result of such examination of these maps?

A. The maps are contained in 12 volumes of Insurance maps of the Island of Manhattan and of The Bronx. Employing as- 4599 sistants, every line of mains laid down on these maps was measured by means of steel tapes——

Mr. **Mathewson**: Measured on the maps?

The **Witness**: Measured on the maps by means of steel tapes. These assistants measured not only the straight pipe or distances, which probably across a folio would amount to 30 inches; they were also instructed to bend these steel tapes and to follow around each and every crooked piece or connection. It is possible to stand a steel tape on edge and follow the most tortuous piece of pipe, that you can get hold of in that way. Every bend and every piece of crooked pipe as well as every straight piece of pipe was measured and the scale on the map, too, was measured with a steel tape; the object of that being to allow for the coming and going of the paper which would contract or expand the scale at the same time that it would contract or expand the paper on which the pipes were laid down. It appears that here is a possible error of about one-eighth of an inch in 36 inches, but that error may be either positive or negative; it may be an error over in one case or an error under in another case; and the error would be only a fraction of one per cent. in the measurements made on the map. These measurements were taken and they were laid down on a series of charts; each map having its separate chart or sheet. The locality of the pipe, that is to say the side of the street which it was upon, the street itself, the street at the beginning and the street at the ending and the side of the street at the beginning and the side of the street at the ending are all marked in the notation.

Q. Together with the number of the volume and the number of the map?

A. Yes.

Q. In the first column?

A. In the first column. Then off to the right are a series
4600 of columns marked, One and One-Half Inch, Two Inch,
Three Inch, Four Inch, Five Inch, Six Inch, Eight Inch,
Ten Inch, Twelve Inch, Sixteen Inch, Eighteen Inch, Twenty Inch,
Twenty-four Inch, Thirty Inch, Thirty-six Inch.

Q. And what appears in all those columns?

A. In each of those columns appears the length of pipe which was of the diameter given at the top, and this was carried out in the case——

Mr. Page: Expressed in feet?

The Witness: Expressed in feet.

Q. As they appear to be in each street named in the first column?

A. As they appear to be in each street named in the first column. Each and every map had its transcript in the form of a sheet or chart made in this way, amounting to something over 300 maps. Each one of these charts was laid down by two men, and then when finished was placed in the hands of two other men, with instructions to go over the work independently for the purpose of checking any possible oversight due to fatigue or carelessness. Everything has been worked through in this way. Each volume of maps is bound together and the first sheet contains a recapitulation stating the total number of feet of each size of main contained in that volume.

Q. Have you fully described these charts now?

A. Yes.

Q. Will you take this recapitulation on each one of them and state what it is, what it appears to be?

Mr. Mathewson: Well, which is the recapitulation?

The Master: Excuse my making the suggestion, but why could

you not offer that recapitulation in evidence in connection
4601 with his testimony and put it in without taking time to question about it and have all the detailed sheets marked for identification, if counsel do not object? There is no reason for putting them all in.

Mr. **Burr**: I will accept that suggestion.

Mr. **Mathewson**: I don't know what these charts purport to show more than the witness has stated. I should like to know what else they show before I know whether I will object.

The **Witness**: The recapitulation is as follows——

Mr. **Mathewson**: Please do not give the totals and so forth until I see the schedules you propose to offer.

Mr. **Burr**: Then I offer these recapitulations.

The **Master**: Have you not a summary made of the whole thing?

Mr. **Burr**: Yes, but we have a recapitulation or summary of each map, and I want to offer that in evidence together with the summary of those recapitulations or summaries, the general summary, instead of as you say—I do not wish to encumber the record with all this vast amount of stuff here, but I want to get in evidence the recapitulation of each volume of maps.

The **Master**: Show them to Mr. Mathewson and see if he objects.

Mr. **Mathewson**: Have you the final recapitulation of everything?

The **Witness**: Yes, these three sheets contain the final recapitulation of everything.

The **Master**: All I want to do is to abridge it as much as
4602 possible. It is perfectly obvious that none of us wants all those details. It will make so much more to handle, entirely apart from any question of expense.

Mr. **Burr**: I offer in evidence the summaries of the maps as they appear on these ten groups or charts or volumes.

The **Master**: He offers ten pages consisting of summaries of the ten schedules to which these summaries are severally attached, and he has offered, I understand, a general recapitulation of the summaries.

Mr. **Mathewson**: I object, Mr. Master, to this testimony on the following ground: It appears that the maps which Doctor Marks has measured are not the primary evidence. It appears that the mains are transcribed upon the maps from the specific records kept by the company of the mileage and the laying of mains, and they are not transcribed frequently until long after; perhaps a year after, in many cases, before they appear in the books. So that if any discrepancy appears the primary source of information is the books and not these maps. They would be no more the primary record than would the map of an insurance company be a primary record as to what policies it had outstanding; its policy records and its ledgers being the original record, and the clerk in the insurance office merely trying to transcribe that accurately, or more or less accurately, upon the insurance map. Therefore, these computations taken from the maps cannot in the nature of things be accepted as primary evidence or as good evidence as against the books.

Secondly, the method of measurement which has been adopted by the witness, assuming that the maps were primary evidence, would be so wholly unreliable that I think it is obvious that the tes-

4603 timony would be valueless as against exact records which are kept and from which the maps are made up.

The MASTER: Have you offered the general summary yet, Mr. Burr?

Mr. BURR: I am offering them all together.

The MASTER: I mean the general one that contains the results, the recapitulation of all the schedules.

Mr. BURR: Yes, and in connection with what Mr. Mathewson has said, I want to say that the evidence is here that these maps correctly show each gas main in the City of New York, and that the books are not necessary except for the purpose of ascertaining their distance from the curb, and that is not what we are concerned about. We are only concerned with the length of mains and the size of the mains——

The MASTER: Is not all the information you wish, for the purpose of argument, contained in your general recapitulation, the gross results of all your figures?

Mr. BURR: You see the great volume of material which we have here and out of that volume of material I only wish to offer the first page, showing the summary of each volume of maps; and then the recapitulation of that summary. I think for a proper understanding of the situation it would be necessary to have that. At present I will content myself with offering those three sheets.

The MASTER: These three sheets contain the gist of what you want to show by this tabulation?

Mr. BURR: Yes.

The MASTER: I will overrule the objection and take these

4604 three sheets that are offered. I should not take any more, I think, in view of the fact that the competency of this testimony is so more than doubtful; I would not be justified in encumbering the record with any great amount of detail for these figures. Manifestly you cannot show what the number of mains in a street is by making an abstract from a book which some person in the office of that company made up to purport to show. It is some evidence, possibly, but it is not evidence of such a grade that would justify us in encumbering the record with these details.

Mr. BURR: It seems to me it correctly shows the situation, when the superintendent of mains testifies that it is correct.

Mr. MATHEWSON: He was testifying upon another point, whether mains were spread on the maps so they could be identified——

Mr. BURR: His testimony was that it correctly shows the mains in the city.

The MASTER: I will overrule Mr. Mathewson's objection. Those three sheets are allowed in evidence.

Mr. MATHEWSON: Exception.

Sheets received in evidence and marked City's Exhibits 89, 90 and 91.

Q. Will you state the general conclusion arrived at from your examination as to the number of miles in use, and the number of miles not in use, the number of miles abandoned, if it shows them, and whatever other information that general summary marked in evidence City's Exhibits 89, 90 and 91 may show?

A. Referring to City's Exhibit 91, the total actual mains on the Island of Manhattan are found to be 731.49 miles. In the Bronx they are estimated at 5.51 miles, being somewhat in excess of
4605 the actual mains down in The Bronx. Disused mains in the Island of Manhattan amount to 43.68 miles, as marked on the map. The abandoned mains as shown on the map amount to .05 miles; but it appears from the maps as if the abandoned mains had been erased and apparently were abandoned and no record kept of them. That, however, is a mere surmise.

Mr. Mathewson: I move to strike it out, then.
The Master: Strike it out.
Mr. Burr: Exception.

The Witness: The total of all mains, active, disused and abandoned, in the Island of Manhattan is 775.22 miles and in The Bronx somewhat less than 5.51 miles. The figures for The Bronx are taken from page 1988, printed testimony, Exhibit 85, October 31st, 1905, before the New York State Gas & Electric Commission in which The Bronx mains are valued at $47,450.37.

Referring to City's Exhibit 90, the final recapitulation of all the mains shown in the 10 volumes marked 1, 2, 3, 4, 5, 6, 7, 8, 11 and 12 is as follows:

2 inch	3,969.60	feet.
3 inch	138,057.22	feet.
4 inch	477,561.87	feet.
5 inch	430.27	feet.
6 inch	1,945,509.85	feet.
8 inch	468,847.20	feet.
10 inch	69,635.34	feet.
12 inch	305,248.17	feet.
16 inch	82,094.15	feet.
18 inch	32,771.97	feet.
20 inch	143,368.16	feet.
24 inch	35,391.73	feet.
30 inch	140,233.42	feet.
36 inch	19,163.95	feet.
For the Bronx	29,111.	feet.

4606 Referring to City's Exhibit 89——

The Master: Is it necessary, those things being in evidence, to have all these spread upon the record?

Mr. Burr: I thought for the purpose of the examination to have the one single line of figures, as the totals, on the record. That is all he is giving; otherwise we could not clearly understand them in the testimony.

Q. What does City's Exhibit 89 show?

A. Referring to City's Exhibit 89, the comparative cost of the Consolidated Gas Company's mains in the streets of New York City, from Mr. Simpson's figures——

Q. Do you need to read all that? That is in evidence, that shows what you stated?

A. Yes.

Q. You might state the difference, if any, existing, if you have not already stated, between the mains as found by your examination of the map and the mains as testified to by Mr. Simpson, and the difference, if any, in the valuation as stated by Mr. Simpson, and the valuation as stated by you.

Mr. Mathewson: No, he has the valuation on Mr. Simpson's mileage, as compared with the valuation on his mileage.

Mr. Burr: Very well, the statement shows for itself.

The Witness: Recapitulation, Exhibit 89. The measurements from the map shows 91.39 miles less of mains in the streets of Manhattan than are given by Mr. Simpson in his affidavit.

Q. What are they given by Mr. Simpson's affidavit as being?

A. In Mr. Simpson's affidavit the number of feet is 4,344,849.

Q. And what are they as easured from the map?

4607 A. Measured from the map, 3,862,282.9 feet. The cost of laying the mains from map measurement under cobble pavement would appear to be $7,141,231.51.

Mr. Mathewson: Of the mileage which you have measured on the map?

The Witness: Yes.

Mr. Burr: That is all I desire to ask him.

Mr. Mathewson: Does Senator Page desire to ask any questions?

Mr. Page: No, I do not desire to ask any questions.

Cross-examination by Mr. Mathewson:

Q. Referring to the 14th Street plant, I have figured up the depreciation which you have taken out of your valuations $725,175, $11,600, $6,472 and $14,400, and my computation shows the total to be $744,687. Do I understand you to testify that in spite of the depreciation charged off and the amount expended in repairs and replacements, that the 14th Street plant still shows a depreciation beyond that, in your opinion, to the extent of $744,687?

Mr. Burr: I thought you had finished with the 14th Street plant?

Mr. Mathewson: No, I had two or three questions but I did not wish to interrupt you.

A. I make the depreciation $744,687 due to obsolescence——

Q. No matter what it is due to. You have already explained that. I ask you whether you still find, in spite of the amount expended for repairs, renewals and replacements during the past twenty 4608 years, an additional depreciation in the plant to the extent of $744,687 due to the various causes which you have enumerated?

A. I do.

Q. And depreciation is a charge to operating account in that the company must maintain its property or should maintain its property, is it not?

A. Yes, of .85 of one per cent. each year.

Q. But a company is entitled to take care of its depreciation by a charge to operating expenses as it currently occurs, isn't it?

A. Certainly, to the extent of .85 of one per cent.

Q. Well, whatever it is in any particular case?

A. Yes.

Q. And whether that depreciation occurs from one or the other causes to which you have referred?

A. Yes.

Q. Now, we will turn to the subject of mains. I understand that the first five columns of City's Exhibit 89 show the number of feet of each size of main according to Mr. Simpson's testimony, and the cost of the mains, assuming that they are of the lengths testified by Mr. Simpson?

A. Yes.

Q. According to your estimate of value?

A. Yes.

Q. And the last three columns show respectively the number of feet which you have obtained by measuring the maps?

A. Yes.

Q. And the cost of that number of feet of mains according to your testimony, assuming this same unit of cost as you did in your previous computation?

A. Yes, according to the chart which I have already offered as to the cost of laying mains.

Mr. Burr: You mean which was offered in evidence some time ago?

The Witness: Yes.

Q. Now, City's Exhibit 90 shows the sizes of mains and the mileage of each size according to your measurements of the maps, divided as to each volume of maps, is that right?

A. Yes.

4609 Mr. Burr: When you referred to the chart, the chart showing the cost of laying mains, you referred to the diagram showing estimated cost of laying mains in 1905 already in evidence, did you not?

The Witness: Yes.

Q. But upon Mr. Simpson's mileage and upon the mileage which you assumed upon measuring the maps, you used the same unit figure of cost?

A. The same unit figure of cost from the chart already offered in evidence.

Q. And as to City's Exhibit 91, that also shows lengths obtained by measuring the maps divided as to sizes and divided into active, disused, abandoned, and total, respectively?

A. It does.

Q. Where did you get the mileage of "disused" mains, what is the basis of your division of the mains into active, disused and abandoned?

A. The disused mains are marked disused on the maps; the abandoned mains are marked abandoned on the maps.

Q. And the balance you took as the active mains?

A. The balance I took as the active mains.

Q. Do you know whether these entries on the maps were made prior to December 31st, 1905, or since, in any particular case?

A. I have no means of identifying the date of those entries.

Q. Nor the date upon which these mains were abandoned or disused?

A. No means of identifying.

Mr. Burr: Other than the testimony given in that regard by Mr. Simpson?

The Witness: Yes.

Q. Into how fine divisions of an inch was the steel tape which you used divided?

A. Usually into tenths of an inch; sometimes 16ths.

4610 Q. Well, do you mean you used different tapes?

A. There were different tapes used at the outset. I don't know how it settled down at the end.

Q. You don't know how fine the divisions were?

A. I know they were no finer than a sixteenth; there would be no use in using finer than that.

Q. Were they all as fine as a sixteenth?

A. I think they were not. They were not at the outset, but the sixteenth was recommended.

Q. What were they at the outset, one-eighth inch?

A. One turned up that was one-eighth, but I objected to it, but I think it was replaced by a sixteenth, but I am not certain on that point.

Q. You say you followed around the crooked places, you mean the corners?

A. Yes.

Q. And do you understand that the company draws to a hair's breadth around a corner in indicating the location of its mains so as to get the exact and true lengths around corners?

A. Of course I cannot say. I know that they ought to.

Q. Well, you don't know whether they do?

A. No, of course not.

Q. And the difference in going round a corner, governed by the system of curves would be very substantial if it were aggregated for thirty or forty thousand corners, would it not?

A. No, because the maps passed many corners, the tape being laid across the folio wherever possible and the measurements being taken from this side clear out to the other side of the volume, and the tape bent in and held in, and where a curve occurred, being set on edge, and carried around that curve, not spread out straight, but carried around that curve so as to keep the tape right on top of the pipe. There were many measurements as much as thirty inches in length.

Q. But your assumption was that in indicating a turn of the corner of a street the company has laid out its mains to the fraction of an inch upon an exact scale as to distance from the corner of the curb? 4611

A. No, I made no such assumption.

Q. Then if the pipe goes farther from the curb that it would be indicated on the map, it would be a longer pipe, would it not?

A. I studied that matter pretty carefully——

Q. Would it not?

A. Not necessarily, because what you would gain in one cross street in one direction you would lose in the other. All the pipes are brought to an intersection if possible, and if you come too close to the curb measuring that way, if you measure around the other way you would gain that difference. It would not make much difference.

Q. If the pipe did not stop right there, that reason would be asserted by you, but if the pipe stopped there it would not?

A. Come to a dead end?

Q. Yes.

A. Yes, of course, but there were very few comparatively.

Q. Do you know when these maps were made as compared with the actual laying of the pipe?

A. I do not.

Q. You don't know how long the entries were made in the map after mains were laid in any instance, do you?

A. Certainly not.

Q. Did you figure the scale on the maps with the City records to ascertain whether they scaled up with the City records of distances?

A. The appearance of the maps——

Q. Just answer that question, Professor. I am not asking about the appearance of the maps, but I am asking a distinct question.

A. We measured the scale——

Q. Measured the scale with a map?

A. With a steel tape.

Q. Did you measure the scale as to its own map to see whether the results coincided with the engineering records of the city as to distances?

4612 Mr. Burr: You mean for the purposes of comparison?

Q. For the purposes of verifying the exact distances of the map.

A. You mean did I verify the map itself as compared with a city map?

Q. Yes, and the scale as to its own map by comparison with any other map?

A. No, certainly I did not compare the maps with the city maps.

Q. Did you figure the width of the streets by the scale shown on the map and compare in any instances the widths so indicated with the city record as to the width of the streets?

A. I did not compare the maps with the city records in any way, shape or form.

Q. Were your measurements in a block say between Fifth and Sixth Avenues as transcribed upon your final conclusions here, simply the distance of that block as indicated on this map by your steel tape?

A. According to the scale given on the map.

Q. Did you make any allowance for flanges or balls where one pipe goes over another in joints?

A. Won't you make that a little clearer?

Q. Did you make any allowance for flanges of the main where one shuts over the other?

A. You mean the bell and spigot, don't you?

Q. Yes, I am not familiar with the technical names.

A. It did not have to be.

Q. Well, you did not make it, that is the question?

A. If I did I would make a blunder.

Q. Very well. You did not make that blunder then.

A. No, I did not.

Q. That is what I have been trying to discover. When you compared your mileage on City's Exhibit 89 with Mr. Simpson's mileage and state that there is a difference of 91.39 miles, did you take your mileage of active mains alone?

A. I don't know what Mr. Simpson's figures are.

4613 Q. No, I asked what you took——

A. In the case of the map measurements the mileage of active mains was taken, in the case of the map measurements.

Q. You deducted from Mr. Simpson's total of 822 miles, simply the active mains as you measured them on the map?

A. That is right.

Q. And as shown on City's Exhibit 91, did you not?

A. That is it.

Q. You did not include the mains which are disused either temporarily or otherwise, did you?

A. I did not..

Q. You excluded the abandoned mains?

A. Yes.

Q. Now how many miles of mains did you find disused but not abandoned?

A. Forty-three miles of mains were disused.

Q. 43.68?

A. 43.68.

Q. And if you add 43.68, that is the disused mains but not abandoned, to your active mains, how many miles will that make, all told?

A. It is all totaled in City's Exhibit 91.

Q. Well, it will make 775.17, will it not?

A. Yes.

Q. As against Mr. Simpson's mileage of 822?

A. I thought it was 795, finally.

Q. No, Mr. Simpson's mileage of mains including active mains and temporarily disused but not abandoned mains was 822 miles, you will remember. Now if you take your total of active mains plus the mains marked on the map disused but not the mains abandoned, you will get a total of about 775 miles, so that the difference between you and Mr. Simpson on the same basis would be the difference between 775 and 822, would it not, in round figures?

A. Apparently, yes.

Q. How many miles would that be, if you are quick at figures?

A. Forty-seven.

Q. Now 47 miles is not much more than five per cent. of 4614 the total of 882?

A. Just about 6 per cent.

Q. And you stated, did you not, heretofore that a difference of five per cent. between the records and the measurements on a map would not be an unexpected discrepancy?

A. I think it was a few per cent.

Q. Did you not say five per cent.?

A. I don't think I said five per cent.

Q. Do you say five per cent. now?

A. I should say about one per cent. now, after going into the matter very carefully, would be the extreme allowable error due to measurements.

Q. Did you not state in the presence of Mr. Simpson and others here some time ago when the question of examining these maps came up that an allowance of five per cent. for difference would not be excessive between the records and the measurements on a map?

A. I may have done so, but I have decidedly changed my opinion since and believe that one per cent., after investigating the thing, either way, would be the extreme allowable error.

Q. Did you not state to Mr. Simpson that you expected your measurement of the map would come within about five per cent. of the accurate result?

A. If I did so—and I do not know that I did so—I have decidedly changed my opinion since and believe our measurements to be correct within one per cent.

Q. Did you attempt in any way to verify the accuracy of the scale of the maps on which the mains were laid down and on which you took your measurements?

A. Every scale was carefully measured with a steel tape as stated for the purpose of finding out whether or not the shrinkage of the paper had made it different from what it was at the time that the scale was drawn by the draughtsman on the map.

4615 Q. That is not the question. Did you attempt to verify the accuracy of the scale of the map on which the mains were laid down in any way?

A. As I stated before, I accepted the scale on the map.

Q. Would not the purposes of the Company be served as to graphical record of the mains laid whether the maps were exact to a fraction of an inch or not?

A. I think not, no; it would be bad engineering of the worst kind.

Q. You know the Company keeps an exact record, do you not, to which it refers when it has to repair or replace mains, showing exactly the distance from the curb and all the other measurements in detail?

A. It has so been stated to me.

Q. You have spoken of holders and some other apparatus which you stated were not now adequate for the requirements of the Company. Were they not good practice when they were put in many years ago, as the gas business then stood?

A. I fancy they were about the best in the country at that time.

Q. You spoke too about the $282,000 which the Company charged in depreciation for the year 1905, and by a reduction for mains which you thought should have been charged off in two previous years you got about $222,000 or 1.71 cents per thousand. Now you know, don't you, that that was not intended to include the depreciation due to apparatus becoming obsolete and the advance in the art, but that those contingencies were covered in the 10 cents contingent fund according to the testimony of Mr. Addicks. Do you recall that?

A. I beg your pardon, that 10 cents I never did understand the meaning of.

Q. You recall his testimony to that effect, don't you, whether you understood the point or not?

A. Yes.

4616 By Mr. Burr:

Q. That struck you as a novel proposition when you first heard it, did it?

A. It was great.

By Mr. Mathewson:

Q. You don't know that that ten cents a thousand was something advanced by Professor Bemis originally, as he testified, twenty years ago?

A. (Laughing.) That is great, that ten cents is.

By Mr. Burr:

Q. I omitted to ask you a question with regard to the mains. What did you find as the result of the examination of the map as to the duplication or triplication or quadruplication of mains in the street?

A. I have not had an opportunity to go over the charts or abstracts as thoroughly as I would like to have done.

Q. You have just received them?

A. I have just received them within the last hour or so, but during the progress of the work I noticed many instances of where there were a very large number of small mains along streets. If I remember rightly, I say this subject to correction, on six or eight blocks on Broadway there were five or six mains on each block, and I think on the cross streets such as Canal Street and Grand Street, there were in many cases as high as four mains on a single block. With a little time I could look it up.

Q. And you could give the Master the percentage of duplication or triplication of the mains as the result of that examination?

A. Yes.

Q. I wish you would do that over night, so we can have it tomorrow morning if possible.

A. Yes, but every one is worked out though, and I may not be able to get it so soon.

4617 Q. In view of the report of the accountants offered in evidence here, do you desire to modify or amplify or explain in any way any of the testimony heretofore given by you?

A. Referring to my cost of the manufacture of gas, the cash cost at 53.16 cents, I would say that I thought at the time that it was rather high, but as it was based wholly on expert knowledge and arranging a selection of figures without a knowledge of the books I presume it is not worth while to go over the work and change it now.

Q. In other words, you believe the careful examination made by the accountants more accurately states the actual cost than your statement upon the figures given as they appeared at that time, in this case?

Mr. Mathewson: I object to that question as the witness is incompetent and the evidence immaterial.

The Master: Well, Mr. Burr, I do not consider it of any great value. If you want to show any facts that have been brought to his notice by reason of the accountants, investigation which lead him to modify his former estimate of the cost of gas; I think that would be proper, but I do not think general questions like this are proper and I do not think the answers you get to them are of any great value.

Mr. Burr: I was only bearing in mind the fact that he was with the accountants while they were making up their accounting and so forth. I don't know whether it is very material.

The Master: I understand the purport of it is that he does not find anything in the testimony of the accountants that modifies his former testimony except to make him think that his estimate was too high if anything; that is the substance of it. 4618

Mr. Burr: Yes. That is all I have to ask him now.

By Mr. Mathewson:

Q. Speaking of duplication of mains, it was mostly on the avenues and on Broadway where you found any duplication of mains beyond a line of main on each side of the street, wasn't it?

A. There and in addition in some of the crosstown streets down in the lower end of town.

Q. Particularly the large and important streets like Canal Street?

A. Yes, speaking generally, of course.

Q. Where there are railroad tracks and other obstructions of that kind largely?

A. That I have not gone into carefully enough—you are aware of the fact that I only succeeded in getting these data after tremendous efforts.

Q. The details of your measurements and computations which are included in the summaries City's Exhibits 89, 90 and 91, appear in these—how many are there of these?

A. There are ten volumes.

Q. These ten volumes?

A. Some 340 sheets.

Q. Being 340 sheets which you have before you?

A. Yes.

Mr. MATHEWSON: I will ask that these be marked for identification, and I assume that when copies are made we can all have access to them?

Mr. BURR: Yes. I am reserving the right to call the Doctor to testify still further in regard to the duplication when he has had a chance to go over these papers.

Papers marked City's Exhibit 92 to 101, inclusive, for identification.

4619 The MASTER: Have you anything further to-day, Mr. Burr?

Mr. BURR: Nothing further to-day.

HENRY H. EDGERTON, resumed, testified as follows:

By Mr. PAGE:

Q. Mr. Edgerton have you made an examination of the plant and works of the Consolidated Gas Company at 14th Street?

A. Yes, sir, such an examination as time would allow.

Q. By whom were you accompanied in this examination?

A. Doctor Marks and Mr. Lacombe.

Q. Was there any representative of the Gas Company with you?

A. There was a young man connected with the office who went around with us, by the name of Ross.

Q. With what were you furnished for the purpose of that examination?

A. We were furnished as I understood with Mr. Mayer's schedule and measurements of appar-tus.

Q. And did you accept that schedule as far as it gave details as correct?

A. I did. I may say that in a few instances I checked off measurements. We did not have time to check all those measurements, and I took all those as correct as put down in his list except perhaps a few I checked off, those that struck me as requiring it.

Q. Did you make any estimates yourself when you checked them off?

A. Only rough measurements. I did not carry along any other appliances than a small rule, a small measuring rule it was, chiefly used to measure thicknessess of iron in some places and that 4620 was about all. I did not carry it any further. I believe I measured sizes of retorts in some instances.

Q. Did you visit the office building of the works?

A. Yes, sir, I went through the office.

Q. Did you note the contents of the building?

A. I noted the contents of the office. They seemed to be all there. I did not attempt to value it in any other way than put a depreciation charge on account of the appearance of the furniture and some of the contents of the office.

Q. That is, you assumed the value as given by Mr. Mayer in his testimony to be correct as to the office furniture?

A. Yes, sir.

Q. Or what it would be new?

A. I thought that was as near as I could get it without taking considerable time and trouble to verify it.

Q. Was this furniture new furniture?

A. It did not have that appearance, no, sir.

Q. Did it have the appearance of having been in use for some time?

A. All that I noted seemed to have been in use for a long time.

Q. From your examination of that office furniture what would you say would be the proper depreciation taking into consideration the fact that the furniture is now in use and not giving what it would bring at a sale, I mean?

A. From my experience on selling furniture, I should not think it would bring very much. I put a depreciation of 40 per cent. on the whole.

Q. That is the actual depreciation from wear and tear, is it?

A. Well, no; I do not think it looks actually lower than that, to the extent of 40 per cent.; I wouldn't say that. It looks damaged like furniture that has been in use a long time, and I do not think it would sell for one-quarter the valuation scheduled.

Q. No, that is what I said. It was not what it would bring at a sale but what you considered it was worth, considering its
4621 depreciation from use and its condition; is that right?

Mr. **Mathewson**: I think you are leading a little, Senator. I do not think the witness said that.

A. The depreciation on furniture of such articles as are mentioned in this list, the physical depreciation, is rather hard to get at without taking into consideration what it would bring if you had to sell it.

Q. Well, you said that it would bring, if sold, about 25 per cent.?

A. I doubt that it would bring anything like 25 per cent. of its valuation if sold, from my experience in buying and selling second-hand things.

Q. But you place a depreciation of 40 per cent. upon this?

A. Yes, sir.

Q. Now, we will take the next item, the T. F. Rowland boiler, 60 by 16, 80 horse-power?

A. This boiler is put down in my list as 60 by 16 by 0.

Mr. **Mathewson**: 80 horse-power.

A. Yes, but taking the factor of 80 horse-power and without considering depreciation, take it at $1,800.

Q. That is that a boiler of 80 horse-power, T. F. Rowland boiler, would be worth new $1,800?

Mr. **Mathewson**: I object to the witness testifying as to values, and I do not think that he is competent to do so. I make the objection that he is not qualified.

Mr. **Page**: I was not here at the time Mr. Kirby examined the witness as to his qualifications, but he told me he had covered his qualifications as to valuation at that time. If he has not I will proceed to qualify him.

4622 The **Master**: Well, Mr. Mathewson, the witness, as I recall, testified to a very considerable experience in the gas business and in the installation of gas plants, and it seems to me that he is qualified under the rules, as I remember it. I dare say that the Senator would not object, if you want to cross-examine Mr. Edgerton further now, to stop for that purpose. My recollection of the testimony is that he is qualified and I shall have to overrule your objection.

By Mr. MATHEWSON:

Q. How recently have you bought boilers in the City of New York of the T. F. Rowland type?

A. I have been pricing boilers and getting figures on boilers almost every day. I have made drawings of boilers.

Q. Have you bought any T. F. Rowland boilers lately?

A. The only T. F. Rowland boiler I know of especially, is when I met Mr. Allen many years ago. He had made what he called a Sampson-Fox, a corrugated boiler. He had brought the patents from England and commenced the construction in this country of the Sampson-Fox corrugated furnace. Now, I do not remember that this was a Sampson-Fox boiler, this 80 horse-power boiler; although in this work I have seen so many boilers and I have seen quite a number of Rowland's corrugated furnace boilers, which is really a marine boiler, that I could not say whether this was or not.

Q. Are you a manufacturer of gas apparatus?

A. No, sir, but I have drawn plans and started, as I said before, the Murray Manufacturing Company into the business of manufacturing.

4623 Q. I understand that you have designed, but you have never been a manufacturer or seller of gas apparatus, have you?

A. I have contracted to sell it, yes.

Q. As a manufacturer?

A. Not as a manufacturer; no, sir.

Q. What do you mean by contracted to sell it?

A. Well, I buy it from various parties having the apparatus, and design it and contract and sell it to the companies, or have sold it to individuals at times.

Q. Is that a large part of your business now, selling gas apparatus?

A. It is the only part of it I have got, putting in gas apparatus.

Q. How much gas apparatus do you sell in a year?

A. I have not sold any, except buying it from parties manufacturing it. I have not sold any recently.

Q. Are you establishing any plant at present anywhere?

A. No, sir.

Mr. MATHEWSON: I submit the witness is not competent to testify as to the value of this apparatus in the City of New York.

By Mr. PAGE:

Q. Does the same class or type of gas apparatus change its value very materially from being bought in the City of New York than what it would be in any other city?

A. I don't think so. I have noted that the conditions here are stated to be very peculiar, but I would not think it made any difference in the length of a two-foot rule or the weight of iron——

Q. Your impression is, if a machine was worth a certain sum in Philadelphia, and that same machine was worth a certain sum in Connecticut, and the manufacturer would charge the same sum for that machine in Boston, that the value in New York City would be the same?

4624 A. Yes, sir, I have bought a great deal of machinery in New York City at different times and I never noticed anything peculiar about it.

Q. Do you know of any manufacturer of gas machinery that manufactures it solely for the New York market?

A. Well, some few manufacturers seem to have the run of the New York market, but I don't think it is for any reasons of New York conditions other than——

Q. Other than the relations between the contractor and the Company?

Mr. MATHEWSON: No, Senator, you are going a little too far with these leading questions. Every question substantially you have asked of this witness has been leading. I do not think it is fair.

Mr. PAGE: I am sorry if I follow in the footsteps of Brother Mathewson. I apologize most abjectly, if that is the fact.

Mr. MATHEWSON: There is no relation between this Company and any contractor. They take bids for everything and endeavor to get the very lowest price from every contractor.

Q. How many years have you been in the gas business?

A. Forty-five years.

Q. And in that time have you erected gas plants?

A. I have erected probably one hundred gas plants during that time.

Mr. MATHEWSON: He testified fully as to the gas plants he had erected on direct, Senator, in various places.

Mr. PAGE: I know, but you have objected that he is not qualified. Now I am going into his qualifications.

4625 Mr. MATHEWSON: I admit his qualifications on that subject. I asked him on a further subject here. I do not care if you want to go all over it again.

Mr. PAGE: Do I understand you withdraw your objection about not being qualified?

Mr. MATHEWSON: No, I spoke of his testimony now and the testimony he has heretofore given. I do not think he is qualified.

Q. Have you been engaged in the manufacture of gas, and the running of gas companies?

A. I have not for quite a number of years been engaged in the manufacture of gas, but I have been thrown in close relation with a great number of gas companies and counseled them in regard to their operations and given my experience to them in regard to not only the use of apparatus but methods of keeping track of the business, books and so forth.

Q. Have you kept yourself informed as to the progress of the art of the manufacture of gas, the changes that have been made from time to time?

A. I have.

Q. Have you had any other business within the last forty years except that connected with gas making?

A. Nothing whatever except the construction and operation and consultation in regard to the operation of gas works.

The MASTER: I will overrule your objection, Mr. Mathewson. Exception.

Q. Is there any boiler on the market at present known as the T. F. Rowland boiler?

A. I know of none except that Sampson Fox furnace. We have always understood he had the patents.

Q. Is T. F. Rowland manufacturing to-day?

A. I think the Continental Iron Works which he founded is running.

4626 Q. Well, you put your valuation on the boiler as an eighty horsepower boiler?

A. An ordinary eighty horsepower boiler. I did not consider that it was one of the corrugated boilers.

Q. And the value of $1,800 that you gave then was based upon a boiler of eighty horsepower?

A. Yes, sir.

Q. Of that general type, is that right?

A. That is correct.

Q. And did you make an examination of that boiler?

A. I examined all the boilers in a rather cursory manner, and I cannot disassociate now the particular examination of that boiler from a number of others, but I think I must have considered it somewhat depreciated in value.

Q. Well, did you figure any depreciation in value in that?

A. Yes; 25 per cent. We were not given the length of years of these boilers—in fact, not on any of the apparatus, so that the depreciation had to be visible; and, of course, in an inspection of the boilers for depreciation, so far as a thorough inspection goes, so far as a letting down and taking the hand holes and manholes off and going into it thoroughly, we did not possibly have time to do it and could not do it while they were in use.

Q. Did you ask the age of that boiler?

A. We asked the age of that apparatus from time to time of this young man, but he had only been there two years.

Q. And he could not inform you?

A. And he did not appear to know anything about it.

Q. What next did you examine? Did you examine this cast iron tank, 32 by 48, 4 feet 6, over boiler?

A. Yes. Well, I have seen those tanks in use before on top of buildings like that and I expressed the opinion that I did not believe it was in use at all or been used, for years before they went

4627 out of date; so Mr. Lacombe went up to it and found——

Mr. MATHEWSON: Let us hear what you did?

The MASTER: The question is what next did you examine? Did you examine this cast-iron tank?

A. Nothing further than to take his report of the tank. I agreed with that.

The MASTER: Then it is easy enough to say no.

The WITNESS: Well, I examined the stuff he scooped up from the tanks, and it never had water in it, and they were then engaged in pumping it in very vigorously.

Q. Did you see Mr. Lacombe go up to this tank?

A. Yes, I saw him go up the ladder, circle around over the top of the tank and collect specimens of the rust on the insides of the tank.

Q. And when he came down from the ladder did he show you what he had found?

A. He had his hand full of it and inside of his glove and pulled off his glove and showed it. I considered after that it was not necessary for me to go up and get a handful, and took his views on the subject.

Q. Is this construction one that is in use now, having a cast-iron tank over a boiler house?

A. No, I have not seen a tank of that kind in many years. I saw one in New Orleans in 1873 where they have a relatively mild climate and do not have to warm them up in the winter, and we converted it into a sprinkler for shower baths for the men. That is the only use we could think of for it.

Q. In 1873 you say that was, and was it then an obsolete type of manufacture?

A. Yes, it was of no account.

4628 Q. What value did you put upon that tank?

A. I put $2,500 on it.

Q. Upon what was that valuation based?

A. Well, that was based upon a rough calculation of the size of the tank, but mostly on the fact that it was not worth anything anyhow, except for junk.

Q. Well, does that $2,500 represent the value with depreciation off, or is that the value that you figure it would cost to reproduce the tank?

A. I have an idea that is with depreciation. I have not the full figures I made on the subject here.

Q. Then we will turn to the next item, which is the engine——

A. Engine room and fan wheel, I did not attempt to value; it is a thing that a man is apt to go to the manufacturer to get, and I did not have an opportunity to do that. The 50 horse-power engine, I put down at $1,500 .

Q. What is that valuation? Is that a valuation as depreciated, or is it the valuation of what it would cost to reproduce it?

A. Well, it is a small, slow-running engine, 40 horse-power, and a very old engine—old type of engine. I should not value it at any more than $30, a horse-power.

Q. Then is there any depreciation written off from that?

A. Yes, sir; 25 per cent.

By Mr. MATHEWSON:

Q. Do I understand that $1,500 is the valuation after depreciation is taken off, or before?

A. Before.

By Mr. PAGE:

Q. Two small boiler feed pumps; did you value those?

A. No, I did not set a value on those. The jet photometers I took
with depreciation at $65.00. Those jet photometers are al-
4629 ways corroding and wearing out and requiring new drums,
floats. I can buy them new for $130.

Q. That was then in the condition you found it, at $65.00?

A. Yes. They were in such bad shape I could not use them.

Q. What is the next?

A. The next is sink. I did not look at the sink.

Q. Now, what about that McKenzie exhauster?

A. The McKenzie exhauster, that is quite durable; I valued that at $700, allowing $224 for depreciation in an approximation to the apparent state of it. I took it that the exhauster had been operating there quite a long time. There is, however, no very important amount of depreciation on the exhauster, if they are kept in repair.

Q. I do not quite follow you. Is $700 the value with depreciation off?

A. Yes, sir.

Q. Then we will take the exhauster house; one No. 9 Root exhauster?

A. As before stated I put only a small depreciation on that, from the fact that they are very durable; it is 15 per cent. depreciation. I took the value of Mr. Mayer with 15 per cent. depreciation.

By Mr. MATHEWSON:

Q. Well, what would that leave?

By Mr. PAGE:

Q. Mr. Mayer's valuation was $1,980 and you would take off 15 per cent. for depreciation?

A. Yes.

Q. Have you figured that?

A. I have not figured out the depreciation items. I went from this plant to another and did not have an opportunity to do that; and I did not have time to prepare at all the depreciation figures. $1,980 is the price of a new one also, as I quoted a No. 10 to-day at $1,980.

4630 Q. The price was $1,980 and you took off 15 per cent. or
$297 for depreciation?

A. Yes, sir.

Q. Which leaves $1,683?

A. Yes, sir.

Q. Now, the Huntoon governor?

A. I did not recognize that as the Huntoon governor that I was acquainted with, but I took the same depreciation off.

Q. And you took the $75 valuation?

A. From Mr. Mayer.

Mr. Mathewson: Mr. Mayer's valuation is $150, not $75.

The Witness: I do not think that was a Huntoon governor, as I understand it. I have used Huntoon governors but this does not appear, I think, to be one. The Huntoon governor on exhausters as I have seen them are merely to prevent rapid fluctuations in the exhaust of gas. There is a little pressure wheel made to revolve in oil so as to check any too sudden changes in admitting the steam. I understand the steam is governed in an exhauster pipe, a drum containing gas, and the pressure of gas is on that drum; it acts on the steam. If the exhauster is running too slow the steam would be turned on so rapidly that it will cause a jumping up and down of the exhausters, and Huntoon's invention consisted in putting this little retarding wheel or fan running in oil, in order to slacken or lessen the variation, in order to make it draw a straight line.

Q. Well, I understand that this was a different type of governor than you had usually seen as a Huntoon governor?

A. Yes. It was governor, but it had all the appearances of a regular steam governor, but it did not have the Huntoon attachment, so far as I could see.

Q. Well, as to its physical condition, I understand you took 15 per cent. off for depreciation? 4631

A. Yes, sir. I did not attempt to value that particular governor.

Q. Then assuming the value was as given by Mr. Mayer at $150, you would give the value as $127.50, with depreciation, is that right?

A. Well, I don't know about that.

Q. Well, I made the calculation that 15 per cent. is $22.50 of that amount?

A. It is put down here at $75.00 and looking at the machine I thought $75.00 was enough for that thing. It is just a little gas drum about two feet in diameter and all that it operates is a steam valve. I did not question the value at $75.000 but I would question it at $150, I think.

Q. Now, take the No. 6 Root exhauster?

A. I have bought Huntoon governors.

Q. We are away from the Huntoon governor now. One No. 6 Root exhauster?

A. I took the valuation of Mr. Mayer and 15 per cent. depreciation. Those two Root exhausters seem to be doing all the work, and the McKenzie exhauster is a sort of—well an emergency exhauster, but I suppose they are working alternately.

Q. Well, you found it in such condition that you put a valuation of how much for physical depreciation?

A. Fifteen per cent.

Q. Another Huntoon governor: the testimony there would be the same as to the former one?

A. Yes, sir.

Q. It is the same type of governor?

A. Yes, sir.

By Mr. **Mathewson**:

Q. Are you sure that is the same type of governor? Did not this impress you as a Huntoon type of governor?

A. I saw so much machinery there, that is, several days
4632 ago, that I would not be positive, but I think it is the same governor. Of course in going through works at the rate we went it is rather difficult to retain a recollection of all, unless it is put down and some remark made about it in the margin. I put it down as the same.

By Mr. **Page**:

Q. Then we will take the photometer, standard bar?

A. Well, that photometer I know would be worth about $500. I bought that type, but on examining it I found they had some extras in it. They had a new standard of light, Pentane standard; $75.00; so the depreciation on that was very small and I put it the same, $650. They also had in connection with an extra meter—there was a duplicate meter, which is new; worth $100.

Q. And with the extra meter you would say $650 was a fair valuation, would you?

A. Yes, I should think that that covered all the depreciation on account of these extra parts.

Q. What is the next?

A. The next, machine shops. I checked off all the apparatus there and found everything in apparent working order and being used; however, there is depreciation on all that class of apparatus, tools, and I assessed 25 per cent. depreciation throughout the machine shop and the blacksmith shop.

By Mr. **Mathewson**:

Q. The new value you would put as Mr. Mayer did and take off 25 per cent. depreciation?

A. Yes.

Q. The same in the smith shop—take his figures with the 25 per cent. off?

A. I didn't have a chance to value all those different small items there and price them as new, but I am perfectly satisfied that there was that amount new there in value, in the shop, and also
4633 in the blacksmith shop. The material there new would certainly have cost all it is valued at.

By Mr. **Page**:

Q. Now, take the condenser; two condensers, No. 2 rectangular tubing, cast iron tubes, 44 by 15, by 6 feet 2 inches, 648 tubes, 4 inches diameter, eleven feet long, connections 30 inches; what value do you place on that?

A. I did not place a value on that condenser. I wanted to make a more thorough inspection and have some measurements made as a guide to pricing it; and therefore as I did not allow any measurements except what I could make with my little rule, or rather did not allow any assistants to measure, I was not able to calculate that condenser.

Q. Did you ask to be allowed to have an assistant measure-?

A. Yes. Young Mr. Ross not only said he was instructed to not allow anything of the kind but he interned a boy of fourteen along with me—I took him along to keep him out of mischief, and he considered him there for some obnoxious purpose and kept him in the exhauster house while we were making the examination.

Q. Did you have any assistants with you to make these measures or this particular measure?

A. Yes; I had two young men came down equipped with measuring apparatus to make measurements and Mr. Ross telephoned in regard to it and told us it would not be allowed. I could not make a calculation on an apparatus like that off-hand.

Mr. MATHEWSON: The only suggestion that has come to me, Senator, was that Mr. Edgerton wanted to take along some men to make notes for him.

Mr. PAGE: That was at 42d Street.

4634 Mr. MATHEWSON: Oh, well, that was the first I heard and the first I have heard.

The WITNESS: We made measurements at 42d Street without any question and trouble, but I wanted assistants to measure as it hampered me so much to make them individually and it kept me so slow and long over the apparatus and I wanted to get around in time and had very little time and I wanted some assistants to do the measuring and then turn the figures over to me.

Mr. MATHEWSON: Well, you understand that subordinates are bound by general instructions that sometimes are unwise.

By Mr. PAGE:

Q. Well, are there such dimensions given here that you could make a valuation? If you can, you can make it during recess and supply it?

A. There are quite a number of dimensions given here and I could make an approximate valuation on them. In fact I don't see anything out of the way in that calculation, considering the wrought iron tubes and all in this condenser. I took that at a much higher figure than I did the cast-iron work alone. On the other hand I should assess a larger depreciation on any wrought iron in contact with gas than I would cast-iron, on account of its liability to corrosion.

By Mr. MATHEWSON:

Q. Then I understand the substance of it is that you think Mr. Mayer's figures are fair for reproduction, after you take——

A. Taking the weight at 54,000 pounds, as put down here, I do not think those are put out of the way for a multi-tubular condenser which this is. It seems it is not a cast-iron condenser;
4635 it has only a cast-iron base and sides.

By Mr. **Page**:

Q. As I read it, it has cast-iron tubes?
A. I supposed it was wrought iron tubes.

By Mr. **Mathewson**:

Q. Do you say if it had cast-iron tubes the depreciation would be less?

A. Yes; less. The wording here is misleading in regard to the condenser, multi-tubular or any other kind. It is two rectangular, tubular, cast-iron, 648 tubes, 4 inches diameter, 11 feet long, connections 30 inches. I took it at first that this was a cast-iron arrangement and come to look at it more closely I considered it was a regular multi-tubular condenser which is generally made of wrought iron tubes.

By Mr. **Page**:

Q. Well, we will pass that and you may be ready with that tomorrow. What is the next valuation that you put down?

A. The next is a machine shop shed containing a variety of drills, planers, lathes and various machines, which seemed to me new to be fully worth $1,800, but I put on that 25 per cent. depreciation on the tools.

Q. Now the large purifier house?

A. That was part of the apparatus that I wanted to remeasure more particularly. I made a rough calculation according to the dimensions they gave me, 2,550 boxes which would bring out $20,400 as to boxes and cover simply; and as there were only two cranes for hoisting it seemed to me as excessive, the valuation put on by Mr. Mayer; and I desired to remeasure that and go 4636 into it more fully. That is one of the points I wanted to remeasure.

By Mr. **Mathewson**:

Q. Do you wish to put any valuation on it now?

A. I could not put any reliable valuation on that the way it stands, without a remeasurement.

By Mr. **Page**:

Q. What dimensions do you need?

A. The thickness of the iron, the amount of planing surface, how many flanges and plain surfaces there are, and I could not get at the depth of boxes either; they were full of material; and the light they furnished to go down into the cellar would not enable me to go measure the depth of boxes; they seemed to have light—electric by the way—that showed so dimly that you could not see—and I determined to remeasure it, and had the young man come down for that purpose. I will say this, however, that these purifiers are shallow lime purifier boxes, and they are not of a modern type or oxide of iron.

Q. What is the difference in value between lime construction and oxide of iron purifier boxes?

A. The oxide of iron purifier boxes are generally made deeper, you can put more material in them and concentrate your purification into a smaller surface.

Q. That is, you can purify more, you mean, by them? You can purify more gas?

A. Yes, use more purifying material by deep layers. You cannot use deep layers of lime because it puts a heavy back pressure upon the gas, but gas travels through the iron mass with much greater facility and therefore you can make it deeper and hold more, and these boxes would be of slightly more costly operation and more expensive than for iron purification. In other words, with half the money I could construct an iron purification set. 4637 & 4638

By Mr. Mathewson:

Q. But we want the valuation of this particular apparatus?

A. That is what I was trying to get at.

By Mr. Page:

Q. In order to get a valuation on the reproduction of this particular apparatus, you would have to have the additional item of dimensions, the thickness of the iron, and the planed surfaces?

A. The thickness of the iron, the number of planed surfaces and also I should not provide for a double riveted cover of the purifying box. This was a very expensive way to put a box together, double riveted, like a boiler, as if to stand an enormous pressure. I do not think I ever saw a double-riveted purifying cover before; very fanciful. There are other dimensions given here.

At 5:18 P. M. adjourned to December 6, 1906, at 10:30 A. M.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,
vs.
JULIUS M. MAYER, as Attorney General of the State of New York; WILLIAM TRAVERS JEROME, as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIAN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and THE CITY OF NEW YORK, Defendants.

Before Arthur H. Masten, Special Master.

NEW YORK CITY, *December* 6, 1906.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Page, Mr. Kirby.

4640 HENRY H. EDGERTON resumes the stand and further testifies:

Direct examination (continued) by Mr. PAGE:

Q. Did you look at the apparatus in the small purifying house?

A. Yes, sir.

Q. One set of four boxes, 16 by 25 by 3 feet 2, 20-inch center seal, and two hydraulic cranes on track?

A. $13,464.

Q. Do you include in that valuation the supports as specified——

A. Yes, sir; everything that is specified here. I was not able to measure it and I include all the data given in this description.

Q. Was there any figure off that for depreciation?

A. No, I have not taken anything off that for depreciation. That is the cost.

Q. Well, would you take anything off?

A. I think in regard to the purifiers a percentage ought to be taken off on account of being lime purifiers instead of oxide.

Q. Well, as to the physical condition of the purifier, would you take anything off from the price that you have given, for depreciation?

A. They are old purifiers. I suppose you could very well deduct 10 per cent. for physical deterioration. There is nothing that particularly wears out about a purifying box except what we call the trays.

Q. Then 10 per cent. you would say for depreciation, would you?

A. Yes; I think that would be a fair figure.

Q. Now, proceed to the meter house.

A. I have no prices on those meters. I have been trying to get them, but I have not been able to get prices on that size meter.

Q. What do you say as to the age of those meters?

4641 A. Well, the cases seem to be old cases, with new drums, I think. I think those cases were cast by Gratz, if I remember rightly; that would make them thirty years old, at least. The apartments and drums are a more recent construction, and I suppose the drums have been renewed. I could not learn anything from the young man in regard to them.

Q. Then if in Mr. Rowland's schedule there would appear a meter of this size, of meters of this size—two 16-inch diameter by 13, you would think that it was the case of this meter with new drums, the drums having been renewed?

A. That is what I take it. I should make a depreciation of 25 per cent. on five years' use on the drums. That would be allowing as long a lifetime for the drum as I would find they would probably last.

Q. Well, can you express that in figures at all?

A. No, I have not been able to divide that at present, the case and drum, because I have not got the data for it.

Q. What about the No. 4 gas meter?

A. That is what is known as a proportional meter. I do not think that that meter is in use, but I have no price on that. The next is four King's pressure gauges.

Q. Yes, that is a small item; you may give it.

A. Well, those I have put at $12.00 for an ordinary arch gauge. A fine arch gauge would cost double that, according to how it is made.

Q. Did you notice how this was made?

A. No, I did not. The arch gauges are of the same appearance.

Q. Well, pass it. Now, one locomotive boiler and tools given here as 35 horse-power, 5 feet diameter shell by 14 feet 7, sixty 3-inch tubes. What did you value that at?

A. Rating it by the horse-power, $1,050.

4642 Q. Now are the dimensions as given correct for a 35 horse-power boiler?

A. No, it seems the dimensions would indicate a large horse-power boiler. I put that by the dimensions there as $1,400.

Q. That is, if the dimensions as given were not correct the boiler would be worth $1,400; if the horse power given is correct it would be worth $1,050, is that right?

A. Yes, sir.

Q. What do you value the contents of the valve house at; two 9-inch American meter gauges, one large American meter gauge, one 8-inch recording gauge, and one pressure indicator?

A. $89.

By Mr. MATHEWSON:

Q. $89 for the whole four?

A. Yes. I claim that the pressure gauge $50, and the ordinary arch gauge at $24, and the large gauge $20; and the pressure indicator as shown there is nothing but a little clicking telegraph relay or magnet, and cost about $5.00. There are some wires passing in there that I don't know whether they are calculated in or not. I do not know what the length of them is, but what is visible of it is a signal key and a magnet.

Q. And what you valued was——

A. Simply the signal key and magnet. The wires I do not know about. The kind it is I did not know, I therefore could not include anything for the wiring.

Q. Now, we will take the retort house. Four coal stacks of 30 benches each, 15 back to back, 6 retorts to bench, direct fire——

A. I gave the value of those stacks at $42,500 each; $160,000 for the four. And $36,500 for the so-called regenerative benches.

Q. What do you mean? That is the one below, one coal gas stack of 24 benches, isn't it, 12 back to back, six retorts to bench?

A. (No answer.)

4643 By Mr. **Mathewson**:

Q. How much was that?

A. $36,500. I deduct from that 14 dead benches, let down for renewals, at $450; $6,300, and allowing the average lifetime of three years for the 120 benches, I deduct one-third as the current depreciation on those, or $18,000, leaving $182,000.00 net.

Q. What would that be for each one, the $160,000 for instance? Did you separate those on that item, four coal stacks?

A. Do you mean by the separate bench, each bench?

Q. What did you take off each one for depreciation?

A. I took the depreciation figure as the number of benches that were dead.

Q. In money?

A. $6,300.

Q. That would make how much for the $160,000?

A. Off the $196,500.

By Mr. **Page**:

Q. What he wants to know is how you would divide that, how much of that $6,300?

A. Well, the dead benches are let down for renewals of the small type; that is, from $160,000 it would leave $153,700.

By Mr. **Mathewson**:

Q. And the other would stay as it is?

A. The others are not in use. Renew all except the mouthpieces on four or five of the benches.

Q. They were set in 1906, weren't they?

A. They looked like new work.

By Mr. **Page**:

Q. Which one of these benches was set in 1906?

A. The stacks, 24 benches, back to back.

Q. What do you mean when you say the "so-called regenerative"—half depth?

A. There was half depth setting, not properly regenerative
4644 benches, as I understand it.

Q. Well, are they what is technically known as half depth regenerative benches?

A. They are not regenerative benches at all in the sense that the air is heated by alternating between hot flues and then changing the current of air to those that have become hot. The regenerative bench is one in which the air is heated before it goes to burn the gases.

Q. How are the retorts placed in these benches, the six retorts in relation to each other?

A. In the new benches they are right over each other, leaving a wide space between the retorts, which is quite an unfavorable construction for getting the best results out of coke fire. I saw this construction adopted away back in 1874 when I built the New Orleans plant. Those I drew in—they call it drawing the retorts together as they go up, not one over the other, and the results from those benches are very much superior to larger retorts set one directly over the other.

Q. And in a modern construction that had been used, for how many years has the building of the retorts so that one will not be directly over the other or drawing them in, as you expressed, been done?

A. I saw them in use in the old country in 1862, and I first adopted it in this country in New Orleans in 1873. I think I was the first one to adopt that construction.

Q. And is that construction now in very general use?

A. It is the construction that gives results.

Q. That is not quite an answer to the question. The question was whether that construction was in general use now; in New York, I mean.

A. Well, I see a great many retort houses built with retorts built directly one over the other, but I think the majority fill in
4645 that middle space with retorts, either by setting eight retorts or seven retorts.

Q. Now, take the four stacks of 30 benches each; of what construction is that?

A. In those benches the retorts are drawn in so that if they were of ample size they would make a very good direct fire bench; but the retorts are small and short compared with the best construction; in fact, they are very old; they were old when they were built, in construction or method.

Q. I believe this retort house, the testimony is, was built in 1853. Now do you mean——

Mr. Page: Is that right, Mr. Mathewson?

Mr. Mathewson: It was reset in 1906, the one stack of 24 benches, that is the date I find note of.

Q. When you say it was old at the time it was built, did it date back to that time, or at the time of consolidation?

A. At the time of the construction of the New Orleans plant, I was acquainted with Mr. Farmer's construction at that time and saw his benches and had data in regard to their workings. I refer to about the period of 1874. His setting was also employed in Mobile, Ala., where I was consulting engineer.

Q. Is this type of bench what is known as the Farmer type?

A. No, this is modified. Mr. Farmer did not, so far as I know, adopt this present arrangement of retorts, drawing them in.

Q. How is it as to the size of the retorts?

A. The retorts are very small, 12 by 20 retorts, 8 feet 6 inches in length.

Q. If you were rebuilding this plant, would you rebuild these particular benches in the style of construction they are?

4646 Mr. Mathewson: Objected to as immaterial and irrelevant.

Mr. Page: Well, you are asking to have them reproduced, reproduction values.

Mr. Mathewson: Well, this particular plant is what we are claiming on, not some other plant.

The Master: Well, the same thing is got at in another way I suppose by showing, as has been testified in several instances here, that the devices were antiquated and not modern. I think the question in that form is objectionable, and I will sustain the objection, but I do not think it is important so far as you are concerned.

Mr. Page: Exception.

A. I would not think of constructing those benches at present.

Q. Is this type of bench an economical type in producing results?

A. I notice by the accounts that this type of bench produces about 34,000 feet per day per bench. If I remember rightly, I noticed in the accounts it is known as retorts in action. That would exclude such retorts as were lying off to burn carbon. My recollection is that the New Orleans retorts averaged 56,000 feet daily for the year. Those benches were built in 1873 or 1874.

Q. And that was a direct fire bench, was it?

A. Direct fire bench. The small return from the bench also entails a relatively small return per man employed in the retort house.

Q. And as compared with the new construction of regenerative benches, how is it in regard to fuel?

A. My recollection is that these benches consume nearly half the coke produced.

Q. Nearly half the coke produced from those benches do 4647 you mean?

A. Yes, sir, and a good bench would consume 20 to 25 per cent. of the coke produced, or less than half the coke consumed in these benches.

Q. What is the next you have got?

A. The tracks running the length of the building and outside 20 feet for charging and drawing machines.

Mr. Mathewson: Where is that, in the yard?

The Witness: Retort house.

Mr. Page: After the stoking and drawing machines and turntable there are the tracks.

Q. Take up these tracks, six lines of tracks running the length of the building and outside 20 feet, drawing and charging machines, 70-pound rails on 6 by 6 cross-ties, these on 6 by 8 stringers. What value do you place upon that?

A. $4,830.

Q. Without depreciation?

A. Without depreciation.

Q. If constructed in the manner here described with cross-ties running clear across those widely spreading tracks and placed on stringers, I find the timber is by far the larger proportion of the cost, amounting to $3,076. That would be exposed to a large depreciation, and I do not suppose you could allow more than ten years lifetime to that wood.

Q. Well, what depreciation, then, do you say you would give to the $4,850?

A. I would give 10 per cent. for a year.

Mr. Mathewson: What would that be in dollars?

A. That would be $307 a year. I do not know how long that timber has been in there. I made inquiry, but I could not ascertain.

4648 Q. Are these timbers exposed or visible?

A. They are not exposed, not visible; they are buried, but taking the position——

Q. Where were they, beneath the floor?

A. Beneath the floor of the retort house. But I have noted in trolley roads and other places where the timber is buried and supposed to be durable it still rots out.

Q. I understand then that you are unable to put a depreciation further than it would be at the rate of 10 per cent. per year on the timber portion?

A. On the timber portion.

Q. What about rails?

A. Rails that weight and apparatus of that weight running over it would be very slight. I do not suppose it would amount practically to anything.

Q. Take up the coke track, four lines of coke track, running the length of the retort house, with 3½-inch rails, 35 pounds?

A. I have not figured that out. I see I have overlooked that.

Q. Well, if you have not go- it, pass on to the next thing that you have.

A. Two coke dumping inclines 32 feet long by 16 feet high, 3-foot gauge. I put that at $500.

Q. Apiece or for the two?

A. $500 apiece.

Q. That would be $1,000 for the two?

A. Yes.

Q. Did you figure any depreciation on that?

A. No, I did not. I did not know the time they had been in use. There was no visible depreciation that I could notice.

Q. With the amount of coke that they have in the works, what is the effect of this coke dumping incline 16 feet high?

A. I think that dumping the coke that high is detrimental; it adds to the percentage of breeze. I saw evidences in the yard of a very large percentage of breeze in the coke, much larger than I had been used to seeing, and I have no doubt much of it is due 4649 to dumping from that height to the ground.

Q. Did you value those engines?

A. Two 7-horse-power engines $400.

Q. Is that with depreciation or without?

A. Without depreciation; 20 per cent.

Mr. MATHEWSON: Two engines, how much?

The WITNESS: $400.

Mr. MATHEWSON: Each?

The WITNESS: No, for the two.

Q. What depreciation did you put upon that?

A. 20 per cent.

Q. $80 that would be?

A. Yes.

Q. And you would value them at $320?

A. Yes, sir.

Q. Did you value the dumping cars?

A. No, I did not value those dumping cars.

Q. Proceed to the next item.

A. The next item, two coke dumping appliances, 20 feet long 40 feet high, I did not see them.

Q. Proceed to the next thing you did see and value. Tower scrubbers, is that it?

A. Yes.

Q. Tower scrubbers, 20 feet in diameter by 84 feet 2 inches over all, capacity of each 1,000,000 cubic feet per 24 hours.

A. I valued that by the weight of the scrubbers given here, 603,000 pounds at an average of six cents.

Mr. MATHEWSON: Weight given where, Mr. Edgerton?

The WITNESS: On this inventory.

Mr. MATHEWSON: Do you mean the weight given by the company or put in by somebody else?

4650 Mr. PAGE: We do not know where it came from. The weight is 603,262 pounds.

The WITNESS: I could not make the calculation of those scrubbers' weight without a good many more measurements than I have got here, but I did not think that weight was out of the way.

Q. What valuation did you put on them?

A. $36,195.

Q. Did you include in that the water tank surmounting the tower?

A. I took this to be the total weight of the whole apparatus.

Q. What depreciation did you place upon that?

A. As far as appearances went there was very little physical depreciation. But the depreciation from antequation or falling out of use would be considerable for the reason that while those tower scrubbers take out ammonia, they are not as advantageous as the more recent rotary washer scrubbers.

Q. In what way are they not?

A. The washer scrubbers use the liquor over and over again and gets it in a more concentrated state and they are generally superseding the coke tower scrubbers.

Q. What about the ammoniacal liquor that is produced from a tower scrubber or from these tower scrubbers if you noticed it?

A. By the use of the tower scrubber by water and you can take the ammonia out of the gas but not in such good shape to save it. The action of the tower scrubber is more to use the ammonia as a purifier than it is to get the concentrated ammoniacal liquor, whereas the washer scrubber would give a better and more concentrated liquor.

Q. Commercially then, the ammoniacal liquor from the tower scrubber is not as valuable as the ammoniacal liquor from the rotary scrubber?

4651 A. No. It is true the ammoniacal liquor can be pumped over and over again in a tower scrubber and there is the attempt made to concentrate it in that way, but it is not as successful as the other.

Q. Did you make any examination of the ammoniacal liquor in these particular tower scrubbers?

A. I just made a—

Q. I do not mean an analysis.

A. I just made an ordinary test by the nose and tasting it; I did not make any determination at all.

Q. Are these tower scrubbers in use in modern plants to-day or plants that are built within the last few years?

A. I believe I introduced the tower scrubber in 1873 and 1874 and it was considered an improvement at that day, but I do not think they stand any chance of competing with the rotary scrubber.

Q. That does not exactly answer the question. I want to know whether they have passed out of use or are they still used in building plants, is what I meant by my question?

A. I do not remember seeing any recent building with tower scrubbers. The tower coke scrubber is also used for a tar scrubber for scrubbing tar, but it does not require any such capacity as it does for ammonia water.

Q. Well, what did you say the depreciation was?

A. Fifty per cent.

Mr. Mathewson: On these scrubbers?

Q. That would bring——

A. The day I was there one scrubber was out of use.

By Mr. Mathewson:

Q. I thought you said a few minutes ago you thought they were in good condition?

A. I said the depreciation was on account of antequation.

4652 By Mr. Page:

Q. Well, 50 per cent. will be $18,097.50, would it not?

A. $18,097.50, yes, sir.

Q. Did you value the foundation on which these scrubbers rest?

A. Yes.

Q. Foundations four inches thick, 34 by 64——

A. Four feet thick.

Q. No, 34 by 64, supported on 300 *plies*, brick circular wall to top of concrete, 6 feet of concrete to the ground level.

A. I made as exact a computation as the description would allow and arrived at $4,582.

Q. Any depreciation on it?

A. No, I did not assess any depreciation on it.

Q. We have an Isbell Porter Standard Scrubber?

A. I have not the price on that.

Q. And you never bought one of the Isbell Porter scrubbers?

A. No, I have priced them but I have forgotten the price of them.

Q. Assuming the price that is given by Mr. Mayer to be correct, which I presume is about $8,000—is it not?

Mr. MATHEWSON: Isbell Porter, $6,860.

Mr. PAGE: Without depreciation?

Mr. MATHEWSON: Yes, and 2 per cent. off for depreciation $6,723. That was his net.

Q. Assuming the price given by Mr. Mayer of $6,860 to be correct, don't you calculate anything for depreciation on account of the age and condition of this scrubber?

A. And on the time and everything in connection with ammonia water or with which ammonia water has a contact, there is a percentage of depreciation.

Q. I think the testimony is that this was installed in 1892?

A. I understood it had that age of 14 years. I put 20 per cent. for 14 years.

4653 Mr. MATHEWSON: It does not appear whether any repairs or replacements had been made since that time though.

The WITNESS: Well, what corroding goes on is very slight. What goes on is internal and you could not see it on the outside, that is true.

Q. That would be $1,372 off for depreciation, would it?

A. $1,372. I did not question the price, so I presume it was obtained from the party.

Q. Well, we are assuming that. Mr. Mayer, as I understand, did obtain it. What is the next thing that you valued?

A. Air condenser.

Q. What value did you place on that?

A. $15,067.

Q. Was that with or without depreciation?

A. That is without. I should not—it is all cast iron pipes and cast iron throughout and coated with tar, probably next to the hydraulic mains, and the depreciation on that, physically, would be very slight.

Q. Take the next thing that you valued?

A. This gas engine house and arrangement I did not value.

Q. Take the next that you did value?

A. Boiler and engine house with 55 horse-power vertical boiler.

Q. 55 horse-power vertical boiler?

A. Yes.

Q. What is the value of that?

A. I allowed $1,100 with $600 depreciation, leaving $500 as the value of that boiler.

Q. What did you value it new, did you say?

A. $1,100.

Q. And with depreciation $500?

A. $600.

Q. The depreciation was $600 but the value with depreciation was $500?

A. Yes.

Q. Now, the 50 horse-power engine?

A. I valued that at $1,000. That is an old-fashioned oscillating engine and there is about 25 per cent. depreciation, $250, leaving $750.

4654 Q. What is the next, boiler house and well, one vertical boiler?

A. One vertical boiler 13 horse-power, $250. I based that on 13 horse-power; depreciation 25 per cent.

Mr. Mathewson: I do not understand whether the $250 is after he has taken out the depreciation or before.

The Witness: No, it is before.

Q. That would be $62.50 for depreciation, leaving $187.50?

A. Yes, $62.50.

Q. Proceed?

A. The well house pump I did not value. It was for pumping up into——

Q. As long as you did not value it, pass to the next thing that you did, was it the boiler in the boiler house?

A. Boiler in the boiler house, 20 horse-power, $360. Stack $67.50 depreciation $21, $46.50. The clock I did not see or the pressure gauge. The valve house——

Q. Was there any depreciation on that boiler and stack?

Mr. Mathewson: He has given the stack depreciation $21, net $46.50.

The Witness: I think the boiler will last forever the way it is now. I do not think it has been used.

Q. Well, do you mean by that it is an abandoned boiler?

A. I think so, yes, sir.

Q. Then would you say that an abandoned boiler was just as good as a new boiler?

Mr. Mathewson: If it had never been used it would be, would it not? He says he does not think it had ever been used?

The Witness: This was in the well house and had a banked fire
on and when we went back to the works, they were pump-
4655 ing from that house into the rectangular tank as described,
and it connects with the tank, but I do not think that tank
was used for any purpose, no, sir.

Q. This particular boiler is connected with the iron tanks that cover the roof of the boiler house, is that it?

A. Yes, they showed us the connections on the map.

Q. Well, do you value this at—pass on to the next.

A. I don't know how I could put a depreciation on.

Mr. Mathewson: You might on the theory that we might use it some time and it will deteriorate.

The Witness: I do not believe that thing is in use.

Q. Proceed. What is the next?

A. Valve house, one 8-inch Bristol recording gauge; I should think that is worth $50. And the large gauge $24, $74.

Q. Is there any depreciation on this?

A. I would have to know the length of time they have been in use. There is quite a good deal of depreciation, but I have not calculated it.

Q. Proceed to the next.

A. Exhauster house, $2,550 for the exhauster and engine. I got that from the building.

Mr. Mathewson: One McKenzie exhauster is that it?

Q. Do you mean this New York Safety 14 by 16 engine direct connection to No. 10½ Root exhauster 180 R. P. M., what is that?

A. Revolutions per minute.

Q. That is how much?

A. $2,550. I do not understand whether this additional Root Exhauster No. 10 was the one spoken of or an additional exhauster.

4656 This is what I noted as the pumping house, and here called the exhauster house. They have two exhausters in there, or three in fact.

Q. Well, there are three here. What did you value at $2,550, is the point we are after?

A. The engine and the exhauster.

Mr. Mathewson: The Root exhauster?

The Witness: The Root exhauster. That was pumping 2½ pounds pressure. I suppose that is the power pumps.

Q. What depreciation did you place upon that, if any?

A. Well, that looked all in fine order, everything in that building, and I did not put any depreciation on it, without knowing the length of time it had been in use.

Q. What about that additional 10½ Root scrubber?

A. That is correct, $1,600. Also the McKenzie exhauster, $3,000 is correct.

Q. $3,050 is the way it is given here.

Mr. Mathewson: Do I understand he agreed with the $3,050 or that he made a separate valuation?

Mr. Page: I do not understand it that way, but that he agreed with the $3,000 given here.

Mr. Mathewson: It is given here as $3,050.

The Witness: That is right, it was an error in putting it down.

Q. What next did you value?

A. Exhauster house contents, 30-inch valve standards, running through the floor, I think that is correct, I think that is a moderate estimate.

Mr. Mathewson: $525?

The Witness: Yes, sir. The photometer complete with addition of Pentane standard lamps and meter $650. There would 4657 be $500 and $75 and the extra meter would be $100.

Mr. MATHEWSON: $650 is right then, is it?

The WITNESS: I think that is a little bit low. Those meters are worth $100.

Q. Then we will say $675?

A. $675.

Q. Is there any depreciation to be taken off the contents of this exhauster house?

A. No, that looked as far as visible to be in perfect condition and no depreciation could be assessed unless one knew the age.

Q. Very well then. Proceed to the boiler house. Two 50 horsepower corrugated horizontal boilers and stacks, each 3-inch tubes, 14 feet long, diameter of shell 5 feet 6 inches by 16 feet long.

A. These are of the type that I spoke of, the Sampson-Fox type, and it is a more expensive boiler. I put that down at $2,000 for the two, $1,000 each. That is the value with depreciation, for they had all the appearance of having been in use quite a time.

Q. $2,000 is the value with depreciation? Is that right?

A. Yes, sir, that is right.

Mr. MATHEWSON: Have you any objection to his stating in this connection what it is without depreciation?

The WITNESS: I allowed a large amount for those boilers, $30 per horsepower.

Q. That would be $3,000?

A. That would be $3,000. $1,500 apiece. They are marine boilers really.

Q. Did you value the stack?

A. I did not. That stack appears to be new.

Q. Proceed with the next thing that you have. Tanks in the yard, ammonia tanks?

4658 A. No, I could not make any calculation on that for they are not measurable.

Q. Proceed to the next?

A. A 50-horsepower, two-cylinder, oscillating engine, I put at $1,000, and for the boiler $700, $1,700; depreciation 60 per cent., $1,000.

Q. $1,700 for the two?

A. Yes.

Mr. MATHEWSON: That is 50 horsepower, oscillating engine with cast iron walk, 8 by 6 inches by 6 feet 5 inches?

The WITNESS: I am speaking of the engine.

Q. You valued the engine at how much?

A. $1,000 and the boiler at $700, making $1,700, and I took $1,000 off for depreciation, $700.

Q. What was the next thing that you valued there? That is all of the apparatus, is it not, except the tanks and holders. You have not valued those yet?

A. I have obtained bids on holders, but they did not give the bids for exactly this size, therefore I will have to——

Q. You made an examination of the tanks and holders at this plant, did you?

A. Yes.

Q. What did you find in regard to the holders?

A. Those small holders are practically out of use. They are lying dead in the yard. They were raised up during the time we were examining the plant and repainted with tar, but otherwise they were practically dead holders lying there without being used.

Q. Which holders were they that were in this dead condition? Identify them in the plant.

A. There were six holders in the yard between 14th and 15th Streets, I think it was, and Avenue D, or facing the office building; in fact in the same yard in which the purifier house stands.

4659 Q. Was there anything about the holders from which you could tell whether they had been in use or not?

A. Well four of the holders were grounded when I first went there and had been on the blocks. No. 1 holder I shall call it, the one farthest from Avenue D was raised up to about half the contents of the inner section and there was a band of 8 inches of rust and dirty water on the top or on the sides rather, indicating that it had been down, and down for some time; in fact these holders were too small to be of any use——

Q. Did you observe that on any of the others?

A. Yes.

Q. What one?

A. On all of them that were raised up so you could see it.

Q. As we do not know which ones were raised up, will you state? Did they inflate all of these while you were there?

A. They inflated and painted three of them on Thanksgiving Day, that is Thanksgiving Day and the day after.

Q. Did you see them after they were inflated and before they were painted?

A. Yes, sir, I saw those that were inflated and they all had the marks of prolonged settling in the water, such a mark as would be made on a gasholder when the water is gradually settling on the surface and leaving the dirt which gradually settles on the surface of the water, indicating they had been there for some time.

Q. Did you comment on this, you or Doctor Marks, in the presence of a representative of the Company?

Mr. Mathewson: I object to that. We had no representative there for the purpose of fixing the policy of the Company or dealing with that subject at all.

The Master: I do not know that it is of any materiality but I will allow the question.

Mr. Mathewson: Exception.

4660 A. It was commented on between all parties——

Mr. Mathewson: Just a minute.

Q. The question is whether it was commented on in the presence of this Mr. Ross who was the representative of the company.

A. Yes, I think Dr. Marks made remarks about it, and also Mr. Lacombe, we spoke of it several times.

Q. How soon thereafter were the tanks painted?

A. They were painted on the next day, Thanksgiving Day, when we came around the day after Thanksgiving, one had been painted and they were vigorously at work on another.

Q. You examined the buildings of the plant did you?

A. Yes, sir. I did not make calculations of the——

Q. No, you have not made calculations as to their value, but in what condition did you find the buildings?

A. The buildings were very old, and while not what you might call dilapidated, they have evidence of use and repairs. For instance, the retort house has trusses placed across it at intervals which I took to be to repair some settlement or disarrangement of the supporting columns. I think no doubt these trusses were introduced subsequent to the building. I noticed on the water table on both 14th and 15th Streets, notwithstanding the building was said to be sustained upon a double pile foundation, there was quite a perceptible wave; I did not measure it; it is not a straight line water table by any means or straight line; I think a level put over it accurately would show considerable deviation from the horizontal. The brick fences were anchored inside of the yard to keep them from falling out into the street. They lean outward about between 6 and 10 inches at different points towards the street, at the top, particularly on the 14th
4661 Street side. The ground level within is filled several feet higher than the street level, though, and I suppose this was caused by frost. The walls are anchored to the columns of the holder and also ground anchors to keep them from going over farther.

Q. Well, was there anything else you observed about the building?

A. I thought the coal storage building seemed to be in very poor condition and also the open storage yard; the coal storage over which they have the coal handling apparatus.

Q. Did you make any estimate of the depreciation of these buildings?

A. I could not make an estimate of the depreciation with any degree of accuracy, no. I think they are buildings that would be considered as out of date and would need considerable repairs. The mortar in the wall and various places was not pointed up and was washed out near the gutters; in fact, it was about the most dilapidated coal gas plant on a large scale that I have seen.

Mr. Mathewson: I move to strike that last statement out.

Mr. Page: I think it is competent.

The Master: No, I will let it stand.

Mr. Mathewson: Exception.

Q. Have you made any computation or examination as to the results of the operation of the plant in the production of coal gas and the cost of it?

A. I have taken from what we call the carbonizing reports of the works.

Q. Have you got those here? Produce them if you have.

(Witness produces papers.)

Q. Have you made an examination of City's Exhibit T for identification with respect to the 14th Street plant?

A. Yes, sir.

4662 Q. I think these are from month to month?

A. Those are the monthly carbonizing sheets from the different stations and they are aggregated in this statement.

Q. That is something that you had made up?

A. This was claimed by the accountants I think to have been made up by Deloitte, Plender and Griffith. Mr. Cuthbert thinks it must have been made up by the Gas Company and aggregated from that. He said it was the same typewriter. I had got it from Mr. Gans.

Q. Well, that is something that you got from Mr. Gans, was it?

A. That is something I got from Mr. Gans, I having requested him to have such a statement made up by the accountants, and I supposed it was made up by the State accountant, but Mr. Cuthbert says it was made up by the company.

Q. In making your examination, you have used the summary that I now hand you, have you?

A. Yes, sir. I looked this over with reference to the operations of the stations, in dollars and cents; and also compared it with the cubic feet of output.

Mr. Page: I ask that this be marked for identification.

Marked for identification State's Exhibit ZZ.

Mr. Page: You might put on the record that State's Exhibit ZZ for identification was prepared by and produced at the request of the counsel for defendant, by Mr. Carter, of the Consolidated Gas Company.

Mr. Mathewson: I think that is so. It looks so. If there is any correction of that, I will make it later. I have not been able to get in communication with Mr. Carter. He is not at the office.

4663 Q. In the computations that you have made did you consider the corrections on page 15, which appear to be made in lead pencil, as being a correct statement, and as a correction of the typewritten matter?

A. I did not use the figure in that column. I used the figures in the column of gas made, for the purpose of making comparison between the operations of the different stations; not on the gas sold but on the gas made.

By Mr. Mathewson:

Q. So that the pencil corrections cut no figure in your computations at all?

A. No, sir.

By Mr. Page:

Q. Now, from an examination of this record what do you find in regard to the operation of the 14th Street plant, as to cost of production?

A. The average cost of production of the 14th Street plant is 37.85 cents.

By Mr. Mathewson:

Q. Where does that appear, if you will refer to the paper?

A. That is compiled from State's Exhibit T.

A recess until 2 P. M.

4664 After Recess.

Henry H. Edgerton resumes the stand and further testifies.

Direct-examination continued by Mr. Page:

Q. Now, Mr. Edgerton, have you made the computation in regard to the cost of the production of gas at the 14th Street station?

A. I have taken the cost stated in State's Exhibit ZZ, for identification, cost at the 14th Street station, gas made, 37.98 cents.

Q. Have you made a similar computation as to the other stations, and if so which one?

A. I have made a computation on the 21st Street, 44th Street and 99th Street stations, showing a cost of 31.05 cents.

Q. Making a difference in the cost as against the 14th Street station of how much?

A. 6.83 cents. Now, taking in consideration the gas made at the 14th Street station ,1,490,909,000 and multiplying it by the excess of cost at the 14th Street station, we arrive at the sum of $101,929.08 as the difference in cost as against the 14th Street station during the year.

Q. Now, you may proceed with what you were stating?

A. Taking in consideration the loss, which is virtually also a loss in profit on the whole business of $101,929.08, and capitalizing that at 5 per cent., I arrive at the sum of $2,038,581.60 as the impairment on capital of the whole business due to the operations of the 14th Street station.

Q. What do you mean by that expression, "the whole business"?

A. Well, I mean that if the 14th Street station had not been operated at all, and the gas could have been made at the cost of the other stations, they would have had $101,929.08 more of profit on the year's business. 4665

Q. I understand, but you refer that to the impairment of capital due to the 14th Street station, $2,038,581.60?

A. Well, that was interest at 5 per cent. on their capital.

Q. What I want to know is whether that is on the business of the company when you said "the whole business," or whether it is an impairment of capital, or what it is. I just wanted to know what you meant by the use of that phrase "the whole business;" whether you referred to the plant or to the capitalization?

A. Well, the whole business of gas production and sales in New York City; the united plants.

Q. Upon this computation then at what would you value the 14th Street plant?

A. I think that computation virtually wipes out the 14th Street plant.

Q. Well, then, this to this extent would go the reduction of the value of the 14th Street plant?

A. Yes, sir.

Q. In fact, it costs the company that much more to produce gas than it would if they had a plant equally efficient with the other three; is that the idea?

A. Yes, sir; or they could buy gas to advantage from other companies.

Q. Have you made a similar examination as to the cost of gas to the Central Union Gas Company?

A. I had a statement from the accountants of the cost of gas at the Central Union, if I remember.

Q. I show you Exhibit 21 in the record of the case in the Supreme Court in the matter of the complaint of H. Brown and others, customers of the Central Union Gas Company, papers on appeal from order made by the Commission of Gas and Electricity of the State of New York, and ask you if——

4666 A. It appears from this account that it seemed to contain all the elements of cost of gas in the holders, less amounts received from tar, coke and residuals, placing the cost of gas in the holders at 26.57 cents.

Q. From your experience in the manufacture of gas, seeing that the Central Union manufactures 1,596,410,000, would a larger plant be able to produce a better result if operated with the same efficiency and with the same efficiency of apparatus?

A. Undoubtedly.

Q. From your experience and from your investigation as to the cost price of other modern and up-to-date companies, what would you say it would cost an efficient, modern plant, efficiently and economically managed, to produce gas and put it in the holder in the City of New York?

Mr. Mathewson: I object to that, in addition to my previous objection in regard to the witness' competency. He is not shown to be familiar with the conditions in the City of New York, or to be familiar with the price of labor or the price of materials here, and I submit it is simply a case of conjecture and not evidence, unless he is so qualified. He concedes he has never operated a plant in the city.

The Master: He may answer it.

Mr. Mathewson: Exception.

A. Considering the immense amount in New York City of gas and the prices prevailing here as shown in the accounts of the companies which I have looked over, and comparing it with the results and apparatus of a similar kind in other cities I think the price cost per thousand could be reduced to 24 cents.

Q. For a 22-candlepower gas?

A. Yes, sir.

4667 Q. Would you or would you not consider then that 24 cents would be the more correct figure to use in comparing the efficiency of the 14th Street plant than the 31.05 that you derived from the operation of the three other stations?

Mr. Mathewson: Objected to on the further ground that this is a conclusion that the witness is not entitled to draw, even if he were an expert on costs.

Question allowed. Exception.

A. I think a figure of 24 cents should be adopted as a basis as soon as the company is provided with a properly equipped, modern plant in order to make a gas at that price; yes, sir.

Mr. Page: I offer in evidence the Exhibit 21 of the Central Union referred to in a question just put by me, contained on pages 207 and 208 of the papers on appeal referred to, down to the point on page 208 where the first total is given.

No objection.

Received in evidence and marked State's Exhibit AAA.

Mr. Page: You may cross-examine, Mr. Mathewson.

Cross-examination by **Mr. Mathewson**:

Q. In referring to State's Exhibit ZZ for identification, you have been dealing in each case with the cost per thousand made, have you not?

A. Yes, sir.

Q. You do not refer to the 42d Street coal gas plant of the Consolidated Company. Does it not appear from this exhibit that the cost per thousand made is 34.87 cents per thousand of make at 42d Street?

A. Yes, sir.

Q. And you took 14th Street for comparison with the three
4668 water gas stations because it showed a higher cost than the
other coal gas station, didn't you?

A. I did not. I am going to take and put 42d Street through the same process.

Q. That is reserved for a later date?

A. Yes, sir.

Q. Then the difference between the cost at the 14th Street station for the year 1905 and all the other stations of the Consolidated Gas Company is not 6.83 cents, is it?

A. No, sir; it is comparing them with those stations I have named; 21st Street, 44th Street and 99th Street, because those are the only up-to-date plants that you have got.

Q. Those are all water gas stations, are they not?

A. Yes, sir.

Q. And if you compare the cost at 14th Street with the other four stations, including 42d Street, the difference would be less than 6.83, would it not?

A. Somewhat less.

Q. Now, isn't it considered good policy, in view of the fluctuation of the cost of various materials that enter into the production of coal gas and the production of water gas, to have a mixed plant as some witnesses have testified, half coal and half water?

A. Yes, I believe in a mixed plant of an efficient type.

Q. Isn't it true that there is always a difference between the cost of gas produced in a coal gas plant and in a water gas plant in the same city?

A. Yes; it would be according to the cost of materials.

Q. But they probably never would coincide, would they? Either the coal gas or the water gas would cost more in the holder than the other?

A. Yes, the coal gas would generally cost the less because it is a lower quality and more cheaply produced.

Q. But don't you understand that the coal gas which is produced at the 14th Street station and at the 42d Street station is 4669 raised to the same candlepower as the water gas by enrichment, and that it has to be in the City of New York?

A. I understand it ought to be. I think, however, that it lags slightly behind the water gas stations in quality.

Q. Why do you think so?

A. I have made an examination of the reports of the candle-powers, both at the works and the inspector's candle-powers, and my impression is there is quite a notable difference in favor of the water gas stations. That is my impression.

Q. You know, do you not, that the 14th Street coal gas is enriched by oil gas which is produced at 21st Street and sent down to the 14th Street station?

A. Yes.

Q. And that the two gases are mixed before they are ever put in the mains?

A. Yes.

Q. And you know that the city examiner has a test station on the mains coming from 14th Street, do you not?

A. Yes. I found that he had, under different names the different stations represented in his testing office.

Q. And if the coal gas sent out from 14th Street were a 22-candle-power, or so near 22 candle-power as to be likely to fall below it, that would show in the tests of the city examiner made upon the 14th Street mains, wouldn't it?

A. Yes; I think it is always above, and most always above the 22 candles, but not as much above as the water gas plants.

Q. Now, you have said that the difference of 6.83 cents between the cost of three water gas stations and the cost of the 14th Street coal gas station, if applied to the output of 14th Street, would equal $101,000, and that that capitalization at 5 per cent. would be two million dollars. Will you tell me how much $101,000 would amount to in cents per thousand on the entire output of the Consolidated Gas Company, dividing by the amount of its sales, which 4670 are 13,283,000,000?

A. Well, that would require to be figured up.

Q. Cannot you tell me roughly, in a moment? I would like to know what difference that would make on the selling price of our gas?

A. About .76 of a cent.

Q. About three-quarters of a cent. Now, isn't it true that not only does the cost of gas in a water gas plant vary from the cost of gas in a coal gas plant, but that the cost of gas in either a water gas or coal gas plant fluctuates from year to year?

A. Yes, certainly.

Q. Do you know Mr. Cowdery of St. Louis, or do you know who he is?

A. Yes.

Q. Have you seen a statement of Mr. Cowdery to the effect that he has known the cost of gas to fluctuate in a single year as much as fifteen cents a thousand, in the same plant?

A. On the cost in the holder?

Q. No, cost at the burner?

A. Well, that involves a great many more considerations, I suppose; other conditions; it involves taxes and a great many things beside the cost of manufacture. The cost of manufacture of gas is remarkably steady in a given locality, as long as the price of materials remains the same.

Q. But do the prices of material and labor remain the same from year to year in a large city generally, in your experience?

A. Very close.

Q. Do you mean to say that labor and material are very close now to what they were seven years ago in New York City, or don't you know?

A. Well, as applied to gas manufacture?

Q. Yes, I mean gas manufacturing.

A. I think on the whole there is very slight fluctuation in the price of material, so far as my experience goes.

Q. You haven't had any experience in New York City within the last seven or eight years, have you?

4671 A. I followed the operations in gas, yes, sir; pretty closely.

Q. You don't know how much the company has to pay or had to pay in 1905 for oil, as compared with 1897, do you, for the same amount of enrichment?

A. No, I don't know what they got in 1897.

Q. Do you know how the wages of caulkers and other employees of the Gas Company compare now with what they were ten years ago in New York City?

A. I have heard the comparisons made. I don't find that there is any great fluctuation in the price.

Q. Do you know yourself?

A. I cannot say that I know of my own knowledge. I only gather it from inquiry.

Q. Now, you say that this $2,038,000 which you would get by capitalization at 5 per cent., $101,000, would virtually wipe out the 14th Street plant. If you wipe out the 14th Street plant you would have to invest somewhere else, wouldn't you, in order to produce the same amount of gas, if the company produced it?

A. I should have invested long ago in that direction.

Q. That may be, but that is not the question. Would not they have to have further capital and further property to produce the gas which they would lose at 14th Street?

A. Yes.

Q. That would not mean a net reduction of $2,038,000 in the capital of the company, would it?

A. No; the capital remains the same, but its earning powers would be impaired to that extent.

Q. How could the capital remain the same if you wiped out the 14th Street plant and built another plant to produce the same amount of gas? What would become of the 14th Street investment? Would it be charged off to depreciation?

A. It ought to be, yes.

4672 Q. Then your theory is that the 10.89 cents which the company says it has expended in repairs and renewals for the past twenty years has not been sufficient to take care of proper depreciation; is it?

The WITNESS: In my examination of the books——

Q. No, answer the question.

MR. PAGE: I submit the form in which that question is put enables the witness to correct an erroneous theory, if he conceives it to be such, that the counsel has assumed as a theory.

Mr. MATHEWSON: I am asking whether that is his theory or not. That is susceptible to a yes or no answer, I think.

The MASTER: Yes.

The WITNESS: Will you please read the question?

The STENOGRAPHER (reading): "Then your theory is that the 10.89 cents which the company says it has expended in repairs and renewals for the past twenty years has not been sufficient to take care of proper depreciation; is it?"

A. I should think that that amount would more than take care of repairs and depreciation; decidedly more than take care of it.

Q. You think it would?

A. Yes, sir.

Q. Then if the company has spent 10.89 annually in repairs and depreciation for the last twenty years, and you find the plant depreciated now to the extent of $2,038,000 notwithstanding, how do you reconcile that?

A. Very readily. I looked at the books and I found that one of these items was charged as a depreciation item, and it was under the head of renewals; and I found extending back during a series 4673 of years other items under the head of renewals, and I suppose, and I had a right to suppose that those are the same character and therefore they had sufficient to renew that works twice over.

Q. That is the whole supposition, is it? That is the whole basis of your theory, is it? Depreciation as a charge is never an expenditure, is it?

A. No, sir.

Q. But where an amount is charged to depreciation and money is received representing that, then the company expends up to that in new construction, doesn't it, without adding anything to its capital account? In other words, if it expends another similar amount it has simply brought its capital to the point where it was before the depreciation was charged off; isn't that right?

A. My idea of the depreciation fund is that it is set aside as a fund.

Q. Well, let us approach it in another way; we will assume that the company charges off in a period of five years $1,000,000 to depreciation; it puts in new construction to the amount of $1,000,000; that brings the capital back, doesn't it, exactly to the point which it would occupy if no depreciation had been charged off and no new construction had taken place?

A. If the money had been spent on the thing depreciated and not another construction I said they can get it back.

Q. Would not the total plant be of the same value, no matter what part of the plant you expend this money on?

A. Well, that would not be my way of thinking it.

Q. No matter what you think. Won't you answer my question?

A. I don't think it would. I think the depreciation should be spent in the direction of the material depreciation to restore it rather than some other direction.

4674 Q. Let me put it again: assuming that a company in a period of five years charged off $1,000,000 to depreciation upon the various operations of its plant, and that within that same period it expended $1,000,000 in new construction. Would not the total plant value stand at exactly the same figure as though no depreciation had been charged off and no new construction had taken place?

A. It would stand at the same figure, yet——

Q. Well, that is the question. Now you have answered the question.

Mr. Page: I think he has a right to explain if he wishes.

Mr. Mathewson: I think he can do so on redirect. I do not want him to waste time answering questions I have not asked.

Mr. Page: I will take the ruling of the Master on that.

The Master: He has answered the question.

Q. Don't you mean the capital would be the same? Wouldn't it be true that the total capital value would be the same as it was originally?

A. The total capital value would be the same, but if the money was spent in the wrong direction it would not be the same, in the sense that it had been—I will give an example: if you spent the money on mains and allowed an old retort house to go on depreciating instead of renewing that particular thing, their earning capacity would be very much influenced by it.

Q. I am not talking about the earning capacity; I am speaking about the capital value of your plant.

A. The value of the plant is dependent upon the earning capacity, I mean.

Q. Let me show you Complainant's Exhibit 79. Take, for instance, the item of mains, which on November 11, 1884, appear to

4675 be valued at $5,233,962.10; it appears that there has been construction since consolidation of $3,549,249.15, and depreciation has been charged off to the extent of $841,060.22. Now, you observe that the net increase which has been added to the capital is simply the construction since consolidation, less the depreciation of $841,000.22. In that case, does not that amount to a renewal in the mains account of the amount which has been charged off to depreciation by an actual expenditure?

A. Yes; in the mains.

Q. Isn't it so in each one of the other items which appear on Complainant's Exhibit 79, with the sole exception of office furniture and fixtures, where the depreciation has been greater than the addition by about $30,000?

A. Yes, that is true, but it does not——

Q. Well, you have answered the question now. So that an expenditure always goes in construction which takes the place of depreciation and not in the charge to depreciation itself, does it not?

A. Yes.

Q. Assuming that the Company did not construct a plant to take the place of 14th Street, if that were abandoned, you said they might buy gas. Didn't you observe that the amount that the Company had to pay for gas which they did procure under agency agreement was greater than the 31.05 cents and was in fact between 33 and 34 cents?

A. I knew it was higher. I do not take that into consideration.

Q. So that if they were able to procure gas at the same rate that they have heretofore procured it there would not be a difference between that price and the cost at the 14th Street amounting to as much as 6.83 cents per thousand feet, would there?

A. No, sir; but they seem to know how to make it cheaper.

Q. Well, that is another thing. We may hire you to do it before we get through.

A. Very well.

4676 Q. You spoke about the Central Union and that the cost to the Central Union you have stated was 26.57, according to an exhibit which has been offered here. You know that is for the nominal year ending October 31st, 1905, do you not, or don't you know it?

A. Yes, I knew that all those Commission reports ended on this October 31st year, I believe it was.

Q. Did you know that only four months of that period was under the law requiring 22 candle power?

A. I know that the law did not go into operation until the——

Q. First of July, 1905?

A. First of July.

Q. Then if the year ended October 31st, two-thirds of that year would be under the old 20 candle-power law, would it not?

A. I understood there was no 20 candle-power really established here, it was a 22 candle-power rate.

Q. You understood that the penalty was affixed only in case 20 candle-power was produced, didn't you?

A. Yes, I believe they are only penalized at 20 candles, and I suppose they kept it higher than 22 candles.

Q. Why did you suppose? Did you make any examination of the city examiners' records to find out?

A. Yes, there was quite an amount of gas went out higher than 22 candles.

Q. But you found it frequently went below even 20, didn't you?

A. There were occasions, yes, sir.

Q. Have you read the testimony of those representing the Central Union Gas Company before the Gas Commission as to the candle-power the Central Union maintained during the eight months prior to June 1st, 1905?

A. No.

4677 Q. You did not know that they testified that they did not maintain even the 20 candle-power which they conceived to be required by the law, in view of the fact that there was no inspection as to candle-power in the Borough of The Bronx where the Central Union was operating?

A. I did not know they were taking advantage of that.

Q. You did not know that they testified that 26.57 cents would be the cost if they maintained the candle-power, did you?

A. The cost would be slightly greater.

Q. It would depend whether it was slightly greater or otherwise as to what candle-power the Central Union did maintain during the first eight months of that period?

A. In any raising of candle-power, there is a very slight increase in cost.

Q. It has been testified here by various witnesses that a raise of candle-power of 5 would make about 5 cents difference in the cost of gas?

A. Five candles is obtained from a gallon of oil.

Q. Yes, and a gallon of oil costs between four and five cents, according to the records here, does it not, so far as these companies are concerned, at any rate?

A. It is so said.

Q. And did you know that the Central Union product was divided between coal and water gas and that the market for coke was very much better at their plant so that they received a much higher price for coke than the Consolidated got for its coke in the city, or did you not know that?

A. I knew that the market for coke in the city as charged was very low. I suppose they had a very poor sale.

Q. Did you read that the Central Union happened to have customers immediately at hand who took their coke without storage or transportation, at a price substantially higher than the Consolidated was able to get?

A. Yes, but the Consolidated has consumers at hand also.

4678 Q. You understand it was impossible, according to the testimony, to get as good prices for the coke produced by the Consolidated in New York City, Manhattan, as it was by the Central Union in The Bronx?

A. Yes, but I did not believe it.

Q. You have never bought or sold any coke either in The Bronx or in Manhattan within the last five years?

A. No, but I have——

Q. Well, have you?

A. No, sir.

Q. Now, you say a larger plant ought to produce a better result. It ought to produce a better result provided everything else is equal, ought it not?

A. Well, other things being equal, yes. I do not see that there is——

Q. Well, if you had a more expensive apparatus and a higher capitalization per thousand than the Central Union, that would to some extent offset the lower cost of gas, would it not?

A. To the extent that the capitalization is higher, requiring a greater margin.

Q. And the coke conditions and candle-power maintained would also have some effect upon the result?

A. It would have effect; it is all susceptible of calculation as to what it would be.

Q. Now, you say that gas should be manufactured in the City of New York at 24 cents per thousand feet, in spite of the facts to which I have called your attention respecting the Central Union, which for this deficient candle-power gas cost 26.67 cents, do you?

A. I think so, yes, on the scale that they——

Q. Will you name any city where the gas is produced at 24 cents in the holder, including repairs and expense and distribution as to works, as well as labor, and material and enrichment, and so forth, up to the holder?

A. Yes, I think that if I remember rightly, New Bedford has as low a price as 24 and a fraction.

Q. What is the candle-power at New Bedford? Is not the legal candle-power in Massachusetts, including New Bedford, 16 candles instead of 22?

4679 A. Yes, but very few make 16 candle gas. It exceeds that candle-power.

Q. Yes, and so our gas here, so we never, in any instance, fall below it. But is not the legal standard in Massachusetts 16 instead of 22 candle?

A. That is the legal standard, but it is not a marketable gas.

Q. You do not claim they maintain 22 candle power in New Bedford, even on the average or usually?

A. I don't think they do. If I remember rightly they maintain about 18 or 19 candle power.

Q. Now, will you be good enough to divide here this 24 cents which you have said should be the cost in New York, indicating how much should be the cost for coal, how much for oil, how much for labor and the other elements that go to make up the cost in the holder?

A. Well, I made this cost up from the operations in other cities and——

Q. Well, you have not named any other but New Bedford. You may quote anything from New Bedford, if you can, in giving these items?

A. That is public—the people are making gas cheaper and selling it cheaper and they do not want their prices quoted, as they gave them in confidence, and therefore you cannot use their figures. But I——

Q. Well, I shall ask you to state what your details are of the 24 cents per thousand feet in the holder, including also repairs, distribution at the holder and at the distributing station and the ordinary expense?

A. I will have to take time to make up such a statement as that.

Q. You do not mean to say that you have given this 24 cents without making up a statement?

A. As far as that is concerned I had the prices of these other companies in view, and being smaller and some of them not as well situated as New York, I had a right to assume that they could
4680 do as well in New York, and I presume they will with their new works.

Q. Well, the testimony is not that way; but is there any one of these companies to which you have referred that maintain 22 candle power gas, which never allow it to fall below 22 candles, tested at least a mile from their works?

A. No, I do not think any of them have quite that candle power on the average.

Q. I shall expect you to state what these companies are, Mr. Edgerton, if any weight is to be given to your evidence on that ground?

A. Well, I may get leave to use some of those figures; I think probably I can, because they are selling gas cheaper and they probably won't care to make a secret of it.

Q. You are not able to divide up this 24 cents then on the stand at present, are you, to show what you assigned to each element?

A. No, I should take time to do that and be very careful about it. I only made the statement of 24 cents based on other cities where they——

Q. I want to know what the other cities are and what the conditions are which prevail?

A. The conditions did not seem to be any more favorable than New York, except the question of candle power.

Q. There is one question that seems to be more favorable, and that is candle power?

A. Yes, I think you should receive credit for any excess over 22 candles, certainly.

Q. You spoke about the gas manufactured at Danbury, in a previous examination. You do not refer to that gas, do you, where you said you were chief engineer?

A. I said I constructed the works.

Q. No, but you said you were virtually managing it now,
4681 didn't you?

A. I said they referred almost all questions of management to me, sir.

Q. As a matter of fact, that is a sort of oil-water gas, is it not, of something like 35 candles?

A. Yes, 35 candles according to our test, and 44 according to the test with a large burner.

Q. What do you mean by a large burner, Argand?

A. No, giving a large flame, say, about 25 candle flame. We test the gas with a 14 candle flame.

Q. What price does Danbury receive?

A. It averages $2.70.

Q. What is the high and what is the low price?

A. The highest price is $3.15 and the lowest price is $1.75 for that quality of gas, 44 candles, per thousand.

Q. As a matter of fact, you sell your gas at Danbury on the basis of 14 candle power, don't you, with an additional pro rata charge for anything beyond that?

A. 14 candle power it was originally, but it is now 17.6 owing to the——

Q. Will you explain just what that is? Do you make your charge on the basis of 17 candles?

A. 17.6 candles.

Q. And you have an arrangement in your meters, by which the consumer, if he gets 34 candles, pays twice as much, don't you?

A. No, there is no peculiar arrangement of the meter except this: the bill is registered at the rate of one cent an hour for 17.6 candle light and a discount is made from that of 40 per cent.; that is the highest price paid; and I think there is 10 per cent. for cash. The price has been lowered recently. I have not heard to what extent.

Q. But for anything above 17.6 candle the effect of the arrangement is that the consumer pays in proportion to his additional candle power?

4682 A. He pays strictly by the candle power of the gas, yes, sir.

Q. And if the candlepower was 35.2 which would be twice 17.6, he would pay twice as much?

A. Well, understand, we maintain as closely as possible a stated candlepower during the month and he pays the sum that the average candlepower is kept as near as possible——

Q. It is adjusted to 17.6 candlepower?

A. As near as we can get it. In the winter time it may run something below and in the Spring and Summer it runs somewhat above.

Q. In other words, for 500 feet of gas delivered at 35 or 36 candlepower the consumer would be charged for a thousand feet of gas at 17.6 candles?

A. No, he is not charged in that way. It is registered directly on the light.

Q. Yes, I know, however it is registered, that is the effect of it, is it not?

A. The effect of it is he pays according to the candlepower.

Q. And for 500 feet of 36 or 35 candlepower gas he would virtually pay for a thousand feet of 17.6 candle-power; that is the way it is figured, is it not? You deliver him 500 feet of 35 candle-power gas and he pays for one thousand feet on the theory that he pays for 17.6 candle-power.

A. He pays at the rate of two feet an hour. His burner would burn two feet an hour in place of five; that is all there is of it. It is a simple matter of calculation. We do not need to quibble about it.

Q. I am not trying to do that, I am trying to get the facts. You deliver 500 feet if the candle-power is 35 and he is charged for one thousand feet on the theory that you are entitled to charge the gas at 17½ or thereabouts, is not that the effect of it?

A. That is not the proper way of stating it. We do not do anything of the kind.

4683 Q. He pays in direct proportion to the increase in candle-power in substance, doesn't he?

A. That is it substantially.

Q. And therefore the charge is made on a candle-power basis?

A. On a candle-power basis, just the same as all gas ought to be sold.

Q. If a rise in candle-power is only a slight additional expense as you stated a few minutes ago, why is the charge made up proportionate to the increase in candle-power, no matter how much, in the case of Danbury?

A. The charge is made the same all the time. The idea is to keep the candle-power at the same point. We do not alter every month's bill or rate of charge according to the candle-power of that month.

Q. I understand that. Is that the best answer that you can make?

A. If your question implies that there is a constant changing or shifting according——

Q. No, it does not imply anything of the sort.

Mr. Page: Read the question.

Mr. Mathewson: I will ask it in this form.

Q. You stated a few moments ago that the increase in candle-power in New York involved a slight increase in the cost of the gas. Why then in Danbury is it sold for an additional price directly proportionate to the increased unit which you assumed based upon a standard of 17.6 candles?

A. It is sold at a price to produce a profit without any reference to the point you mention. I do not exactly get the purport of your question, but if you mean to say why we do not give this additional candle power for nothing or why we charge for the additional candle power——

Q. No, I do not intend to ask any such thing, Mr. Edgerton. If you cannot answer the question I shall not push it further.

4684 You stated that you were the inventor of a process of gas manufacture. Was not that a process of gas manufacture by retorts, a sort of oil gas process?

A. Oil and water gas. That is a good many years ago.

Q. It was a good many years ago, wasn't it?

A. Yes.

Q. Are any of the plants which you designed and put in operation under this process working to-day?

A. Yes, sir. Danbury is working to-day.

Q. Any other Danbury?

A. No. They have been pretty much chased out of existence. There is no chance of working plants, with promoters scouring the country and grabbing everything they can get hold of. I had a plant operating at Wallingford and operating well and successfully, and they were never left at peace. There were promoters there, and there was not a month in the year, when some schemer was not there to get them to change their plan of operation, not a month in the year, and sometimes not a week.

Q. Trying to induce them to put in a poorer process than yours?

A. Yes, and it showed it, because they have gone to pieces, and they pay no more.

Q. And the owners of gas plants which you put in under this process have been persuaded by promoters to substitute other processes for yours in every place except Danbury?

A. Well, I will give you the history of New Orleans, now you are asking about this. The New Orleans Company paid the construction works $700,000 of bonds through the operation of my plant; they raised the interest payment from 5 per cent. to 6 per cent. They were persuaded by promoters to water their gas down and decrease the illuminating power and went into the hands of receiver. That was about the end of their day.

4685 Q. How long was your process in operation in New Orleans?

A. Quite a number of years, long enough to pay up all the bonds and increase the interest from 5 to 6 per cent.

Q. Then they found it advisable to substitute some other plant, did they, some other process?

(No answer.)

Q. Do you remember what year New Orleans went into the hands of a receiver?

A. About three years ago, I think it was, two or three years ago.

Q. How many years before that was your plant in operation in New Orleans?

A. It was only operated in substance for a number of years——

Q. How long before that time was another process and plant substituted for yours in New Orleans?

A. Oh, they commenced experimenting on various processes from 1890, along in there somewhere, I think. I saw it in Brown's Directory. I did not keep very close tab on the matter, but I saw it put down in Brown's Directory as my process for quite a number of years. I don't——

Q. Now, do you understand that the New Orleans Gas Company, the operating company in the City of New Orleans, actually did go into the hands of a receiver at all?

A. That is my understanding.

Q. Do you state that to be a fact?

A. I think they made some sort of an arrangement by which they got out by some deal or arrangement, but that was stated in some engineering paper that I saw, that they had——

Q. That is the basis of your information on the subject, is it?

A. No. There is a young man that I put in charge of the plant in Asheville, North Carolina, who told me it was the worst busted thing he ever saw.

Q. New Orleans?

A. Yes.

4686 Q. And he told you the New Orleans Company went into the hands of a receiver, the operating company?

A. He told me they could not pay their lease. That is just like all those promoted concerns, they bust sooner or later.

Q. Let us take the property at 14th Street respecting which you testified. You say you put the furniture, at $1,875 cost new, according to Mr. Mayer, at 40 per cent. depreciation, and you say that it will not sell for its original price or anything like it. Is it not true in your experience that second-hand furniture, even if you have it only for a few days, brings but a fraction of its original cost if it is sold as second-hand furniture?

A. That is just it. I was taking the value of it, but I could have purchased an outfit like that for one-quarter of the sum.

Q. Second-hand?

A. Second-hand.

Q. Why did you put 60 per cent. instead of 25 per cent. as the present value?

A. Well, I thought the furniture was useful as it was, and although furniture equally good could be purchased at far less, the fact that it was about as useful and good for the purposes of the company, it was not entitled to that depreciation.

Q. You were never in the furniture business, were you?

A. No, but I know what it is to sell furniture.

Q. Yes, second-hand furniture. Do you mean to say that the contents of this office building as recited in the schedule that you have before you could be purchased new for less than $1,875?

A. I presume not. It might cost more than that.

Q. Did you not find that all the desks seemed to be solid and in use, and sufficient for the purposes of the company?

A. Yes, that is the reason I did not consider it depreciated as I could have bought such furniture second-hand.

4687 Q. And your valuation then was on the basis of second-hand furniture, was it?

A. Not entirely. I assumed that as second-hand, looking the furniture over, that it could be purchased at one-quarter of that, but as it was still as useful for ordinary use, the depreciation of 40 per cent. would not be out of the way.

Q. Did you not find that these desks were in use and were apparently sufficient for the purposes of the company?

A. Yes.

Q. You did not see any of them breaking down, did you?

A. No, there was nothing the matter with them.

Q. The iron safe seemed to be all right, didn't it?

A. Yes, an iron safe is a pretty lasting piece of furniture.

Q. Will you point out the items there which has been broken down or which appeared not to be serving their purposes all right?

A. I do not claim that they were not serving their purposes. I suppose some of the chemical apparatus might be broken down. In fact, it would be impossible in the time that I made that round that I should look minutely into all those. I just took a glance over all the furniture.

Q. Have you bought any Rowland's boilers lately?

A. No, sir.

Q. Did you get any quotations from the makers of the Rowland boiler as to the price for which they would install an 80 horse-power boiler of the dimensions specified here?

A. I did not, because I consider the Rowland boiler too expensive for ordinary use.

Q. You do not deny that the cost of a Rowland boiler if you were to get a Rowland boiler of that character would be $2,109, as Mr. Mayer stated, do you?

4688 A. No, that would be over—I say $25 a horse-power. I think that was a high price for a boiler for such uses.

Q. I am talking about a T. F. Rowland boiler, this particular brand of boiler of the dimensions specified here and of 80 horse-power. Have you any doubt that that would cost new $2,109, if you wanted to buy that kind of a boiler?

A. I did not quote Rowland on it. I think very likely they would charge that, because it is a very expensive boiler to make.

Q. Let us take the cast iron tank which you say you saw on the roof, $4,275, according to Mr. Mayer. You valued it at $2,500. Was not your valuation due to the fact that it was not in use, as you thought?

A. I figured that out as any iron work, I think it came to a few dollars over $2,500, calling it ¾ inch thick and allowing for flanges, and I think I allowed 6 cents a pound on that computation.

Q. How much did you assume that it weighed?

A. I did not assume it, I calculated it at ¾.

Q. How much did you calculate its weight was?

A. I am mistaken in the figure I employed as a multiplier. 72,348.

Q. Pounds?

A. Yes.

Q. At 6 cents would be how much?

A. I stated that wrong. It is 3½ cents.

Q. You took it at 3½ cents?

A. Yes. It is not wrought iron work, it is a casting.

Q. Will you tell me how that 3½ cents is divided between the various elements of the price of material, shop labor, freight——

A. I did not figure that up. I figured it in bulk, for I did not have time to go into all the minutiæ. I took 3½ cents; $70 a ton is sufficient to make a tank.

4689 Q. Well, we are talking about this tank. Did you measure the thickness of it?

A. No, I did not measure the thickness of it, it is ¾ inches thick.

Q. Assumed?

A. Yes, I assumed ¾ inch as sufficient.

Q. Will you tell me how much of that 3½ cents you allowed for the average price of material to make a tank of that sort?

A. Well, it was all iron, iron casting, I thought that was ample.

Q. How much do you allow of that 3½ cents for the average price of material without any labor at all on it?

A. You mean of the iron itself?

Q. Yes.

A. Iron would not be worth any more than——

Q. The average price of material in the shop?

A. Not more than a cent.

Q. Not more than one cent?

A. Yes.

Mr. Page: Do you mean the casting or the raw iron?

The Witness: Do you mean the pig iron?

Q. I mean the material, pig iron.

Mr. Page: Start back at the ore, why don't you?

Q. Well, take the finished casting without any further labor on it; take it at that stage, the finished casting. How much per pound would you allow for that?

A. I did not divide it up, but I suppose two and one-half cents a pound would be the casting price.

Q. That would be one cent to cover shop labor and freight and drayage and labor of erection?

A. Yes.

Q. Do you think that one cent would cover those items?

A. I think possibly, yes.

Q. Not possibly, but do you think it would?

4690 A. I took that lumped, at $70 a ton, sufficient to cover that kind of work.

Q. I am trying to get you to go into details?

A. I cannot do that because I did not make a detailed calculation in that way, for there is no chance without accurate measurements of the tank, and the actual thickness of the tank, and I do not really suppose it was three quarters inch thick, in the first place, because it is only four feet deep and three-quarters of an inch thick would be rather heavy plate.

Q. You said probably two and one-half cents for average price of material in the casting. Now how much would shop labor be, do you think, or have you not ever manufactured apparatus of this kind so you can tell?

A. I have seen details of shop labor. I did not put that in there.

Q. Can you state how much the shop labor would be on that?

A. No, I cannot. I know they put——

Q. Can you tell how much the freight would be from the place of manufacture?

Mr. Page: If you give us the place we might ascertain.

Mr. Mathewson: He has given the value, I think I will ask him to state.

The **Witness**: I did not suppose they went any great distance. It never entered my head that they went to Havana or any distant place.

Q. Well, they probably did not go to Havana, they might go there for cigars. Let us come down to casting. What allowance did you make for freight? You must have assumed it came some distance and was not made in the shops of the Consolidated Gas Company?

A. I am taking cast iron delivered in shapes that are planed to a certain extent, I think $70 a ton would cover it.

4691 Q. How much per pound for freight?

A. It depends where it came from.

Q. Oh, well, assume any reasonable place, not Havana.

Mr. **Page**: He says he did not make that calculation.

The **Witness**: There was no freight, nothing more than a lump sum.

Q. You did not include any freight in your 3½ cents?

A. I did not divide that up into shop labor, the number of bolts, the number of surfaces planed?

Q. Did you include any shop labor in your 3½ cents?

A. I included that thing put up there for 3½ cents per pound.

Q. Taking the price of material at 2½ cents, I want you to tell me how much of the one cent remaining is shop labor, freight and drayage, and how much is the labor for erection, just those four items.

A. I stated that was the lump price. I could not go into the details of it.

Q. Could you cast such a plate ¾ of an inch thick successfully, do you think, or could it be successfully done ordinarily?

A. Plates are cast ¾ of an inch thick, thousands of them, every day.

Q. Of this size?

A. You do not suppose that tank is all in one piece, do you?

Q. I am asking you a question?

A. It depends what size——

Q. Don't you know what the sizes are of the plates in that tank?

A. No.

Q. You did not observe that?

A. No, I know they made them as big as they could to get them together.

Q. Would not the iron chill in running a plate of that thickness or size, or are you not able to state?

A. Of what size?

4692 Q. Of the size the plates were there as you observed it?

A. I said I did not go inside of the tank and observe the size of the plates. I simply took it that would cost—a plant as large as that, they could successfully cast the plates and flange plates——

Mr. **Page**: What was the question, would not the iron chill?

Mr. **Mathewson**: Yes.

The WITNESS: Whether plates of that thickness are cast every day? Thousands of them.

Q. Of the size of the plates that are there?

A. Well, the size of the plates that are there I don't know anything about.

Q. I do not care anything about thousands of other plates. I am talking about the plates here. Let us confine ourselves to the subject in hand?

A. If I had been allowed to go there and look in the tank and take the size of the plates I could have made an estimate——

Q. You say there was a new engine there that was connected with that tank, don't you?

A. I don't think there is a new engine.

Q. Did you not say there was a new engine there which you say you thought never had been used and which you were informed was connected with that tank in some way?

A. No, I said there was an old boiler fired up there and banked.

Q. What was this new engine connected with, what tanks?

A. I think the only item I mentioned to you of apparently new work was in what they call the exhauster house, or what I should call the pumping station. I did not see a new thing around the place so far as I saw, I don't remember mentioning anything new.

Q. One more question then about this tank. If the plates were small there would be a greater weight of flanges and also an increase in shop and erection labor, would there not? 4693

A. Yes. I made a calculation that a plate could be cast, that is, three-quarters of an inch thick, and adding ten per cent. for the flanges, that would make that tank—I have seen tanks made without any planing whatever, simply caulked in, and I presume it is fair to assume that that tank is caulked in with iron filings.

Q. How could you compute ten per cent. for flanges, unless you knew the size of the plates, because the amount of flanges depends on the size of the plates?

A. All those questions—we will say 10 per cent. for laps and rivets, in wrought iron work, and we assume a given amount for flanges, not taking it to be anything out of the ordinary, that there were some extraordinary flanges, and some extraordinary plates. I took it just as an ordinary tank plate. I will say this, that the older form of tank plates were very frequently put together just simply with iron cement.

Q. I don't care about what happened in any other case except in this particular tank, so if you have got through with this, I will go on to another subject. Take this one small engine, Novelty Iron Works, which you place at $1,500 against Mr. Mayer's $3,000. Did you get a price on an engine and if so from whom?

A. Anybody knows that a 50 horse-power engine can be bought at $20 a horse-power at any day of the year, a perfectly span new engine.

Q. Does it make any difference what the brand is?

A. There is a great deal better engine than that, for that is an old engine.

Q. Did you make any inquiry of the Novelty Iron Works or whoever manufactures that boiler now as to their price for an engine of that description?

4694 A. No, the Novelty Iron Works as I remember it died off years ago. I haven't heard a thing of them for at least twenty-five years.

Q. I covered that by saying whoever manufactures that engine at present.

A. Yes, I have got prices from dozens of people.

Q. Will you give me the name of any concern manufacturing the Novelty engine from whom you made an inquiry before your testimony here as to the price of an engine of that description?

A. The Buckeye engine makes a very much better engine than that.

Q. That is not the question. Won't you be good enough to answer my question, or I will never get through with you, if you do not. Will you give me the name of the concern from whom you made an inquiry and which is now manufacturing that engine, as to the value before your testimony here?

A. No, I did not consider it necessary to make a Novelty engine. It is a steam engine of a certain horse power, and it is an old inferior engine compared with engines that I can get at $20 a horse power. That is a simple proposition.

Q. You then appraised some other engine and not this particular engine, did you.

A. I appraised a better engine——

Q. Did you appraise this particular engine? Do you mean this particular engine can be purchased new from the manufacturers and installed at less than $3,000, and if so give me the name of the concern that manufactures it or will do it?

A. I don't think, as far as I remember the engine, I don't think there is a concern in the United States making that engine. I don't suppose such an old engine is made by anybody. The present engines are much superior.

Q. Did you include in your figures the cost of installation
4695 of the engine, the erection of it, or was it sidewalk delivery
as Mr. Logan testified respecting some of his items?

A. Well, say 50 horse-power at $20, at which I can buy a better engine, is $1,000, and I assessed that at $1,500, I think $500 will cover putting that engine [illegible] position, I suppose; I am satisfied it would.

Q. That is not the question. (Question repeated.)

Mr. Page: I think the witness has answered.

A. My answer would be that I assume that $20 per horse-power for a better engine, and that was $1,000, and I allowed for this engine $1,500, which would put it in position and pipe it up and do everything you wanted to do, and there was a depreciation on it which I called 25 per cent.

Q. Do you put the same depreciation on one type of engine as on another?

A. No, I put a larger depreciation on some engines than others. The faster the engine goes, the wear and tear is probably greater;

the greater the piston speed, although it is a matter which is of small difference.

Q. Did you find the engine in operation?

A. The engine was going when I was there, yes, sir, and running smoothly.

Q. No outward indications of deterioration were there, as you observed?

A. No, there is nothing—unless an engine is actually broken down, there is nothing shown outside. The wear and tear on an engine is the cylinders which have to be rebored or——

Q. You did not observe any pounding, did you?

A. No, the engine was moving well enough. I did not hear anything wrong about it. It was a slow moving engine, if I remember rightly.

Q. Is it not also true as to the McKenzie exhauster and the No. 9 Root exhauster, that they, so far as the outward appearances are concerned, were in perfect working conditon? You have 4696 appraised them at the same price new as Mr. Mayer?

A. All those things looked well enough outside. The moving parts are all inside, and the wear and tear takes place, barring accident, in the inside.

Q. Is $150 higher than the cost of a Huntoon governor?

A. I have bought a Huntoon governor, exhauster and all for less than $150. It all depends on the size.

Q. How many years ago?

A. Several years ago. I guess the old man is dead now.

Q. You have not bought a Huntoon exhauster of this size in the last two or three years for less than $150?

A. I don't know whether they are made now. I don't believe that governor is less than twenty-five years old.

Q. Aside from that, you have not bought a Huntoon exhauster of this size in the last two or three years for less than $150?

A. I don't know that a Huntoon governor is made anywhere, I don't suppose you can find one.

Q. It was a well known character of governor and had a high reputation?

A. Years ago it was considered a very good thing. It is to prevent vibration in an exhauster. I first saw it in operation in the Mutual Works in New York; they were cracking it up then; and I became afterwards acquainted with Mr. Huntoon, and in talking about prices, he made an exhauster, governor and all included, for $150.

Q. What kind of exhauster?

A. A jet exhauster.

Q. What size was the governor?

A. It was a small affair. But a governor, understand, does not have to be in proportion to the size any more than the Governor of New York has to be any bigger than the Governor of South Carolina.

Q. It was not a governor of the size of this governor, was it?

A. Just about the same size, I don't think there was any difference in the size of the drum.

4697 Q. What is a jet exhauster?

A. That is just where you exhaust gases by a jet of steam going through an aperture and drawing the gas with it. It has been used for a good many years.

Q. It is not a very elaborate piece of apparatus is it?

A. It is not very elaborate, but it is quite useful. There are great numbers of them in use, the exhausters and blowers at present.

Q. Now is it not also true that the No. 6 Root exhauster and the one drill press in the machine shop to which you have referred and which you valued new at the same price as Mr. Mayer, showed no outward evidences of being out of repair?

A. The Root exhauster you are inquiring about?

Q. Number 6?

A. No, the outside of an exhauster, unless it is broken down, does not show the wear and tear its interior has, but the blades revolving in the cylinder wear away and are taken up by springs and also the cylinder itself in which it operates is worn away.

Q. Are there any blades in a Root exhauster?

A. Yes, sir, there are blades in a Root exhauster. Did you ever see inside of one?

Q. How many?

A. There are two blades for each one of the revolving discs. You have got to run it with blades. Where did you get your information there was not any?

Q. I did not get any information. I am trying to get information from you, but seem to have had very poor success, because you don't seem to know very much about it, if you want to know.

Mr. Page: I object to counsel making these statements to the witness.

The Witness: I will make a sketch for you if you want me to.

4698 Q. Let me call your attention to the smith shop. Take the four forges, four anvils and so forth, $430, and the other items in the smith shop which you valued new the same as Mr. Mayer; is it not true that those were apparently in good condition?

A. An anvil always looks all right.

Q. But you took 25 per cent. depreciation off for that?

A. Well, it was in bulk, for all the shop, which includes emory wheels which wear out, and tubes, and stocks.

Q. Were those emory wheels worn out?

A. An emory wheel does wear out.

Q. Were those worn out? Of course an emory wheel does wear out.

A. I could not of course examine everything, I took it from the appearance, that 25 per cent. depreciation was all right. The price seems all right, but it certainly was a most decrepit place, if you want to know the truth. I never saw anything in the way of a blacksmith shop even out in the country that looked so worn out.

Q. Will you define which of the items in this smith shop were worn out? Give us the names of them. Tell us how they were worn out. How about the forges, were they worn out?

Mr. **Page**: I do not think the question is fair, in that the witness has not said they were worn out.

The **Witness**: They had the appearance of a tramp.

Q. Were the forges not in good condition for operation?

A. I don't think they were. I don't think I ever saw one——

Q. Did you see them operating?

A. I saw them blowing away.

Q. Didn't they seem to be doing the business?

A. They were doing the business, but taken at the price
4699 it is assessed at, a depreciation of 25 per cent. seems to me very small.

Q. I am trying to find whether it is small or not, and I am therefore asking you whether those four forges did not seem to be doing the business for which they were designed.

A. I don't think there were but two of them in operation. I did not notice any——

Q. Did you notice any outward evidence of decrepitude, did you?

A. Yes, I did.

Q. Well, what was it?

A. A geenral woe begone, played out condition.

Q. Bellows broken?

A Have you ever been——

Q. In a blacksmith shop?

A. In a blacksmith shop.

Q. A great many of them.

A. They look dirty all of them.

Q. Yes, that is likely.

A. But these were not anything recent, they were not even blower forges, but old bellows type.

Q. No matter what the type was. We are taking the type as we find it. I ask you if these four forges were in condition to operate, and if two of them were not operating?

A. I think two of them were operating.

Q. Did you observe any difference between the two that were operating and the two that were not?

A. No, not so particular as that.

Q. You have said the four anvils were all right. How about the set of blacksmith tools, were they not all good quality so far as you observed?

A. I took it from the general appearance, of course, I could not pick up, in the time I had, every piece of tools, and I don't suppose any person would, but I took it from the general appearance.

Q. Did you examine any of the tools to see whether they
4700 were of the proper material and were still fit for use?

A. I looked at them as narrowly as passing through and spending ten minutes in the shop would allow.

Q. Tell me which tools were not in good condition and proper for immediate use?

A. I am not certain that any of the tools could not have been used, or they would not have been worth anything.

Q. Tell me which tools were not in good condition and not ready for immediate and efficient use.

A. Well, I will—the four sets of blacksmith tools, of course, we know they wear out——

Q. Of course, they may wear out, but I am talking about these tools there as they are now, Mr. Edgerton. Won't you tell me which of those tools were not in good shape and ready for efficient and immediate use?

A. I do not say that they could not be used. Tools may be very much depreciated and still be useable. I have seen——

Q. Did you observe whether there were any chisels there and whether they were excessively blunted for use or anything of that sort?

A. I did not notice the chisels as particular fixtures.

Q. The grindstone seemed to be in good shape, didn't it?

A. I do not look at it in particular, I looked at things generally.

Q. We will pass now to the condenser house. I think you agreed with Mr. Mayer in $29,106 on that and also——

A. No, I say that I could not make a measurement of that because they would not let the men do it. There is a number of things I could not personally pass on in the inspection, and I got two young men to go and look into it more particularly and make measurements, and they were not allowed to do so, and that is the reason I could not calculate that.

Q. Yes. That was not our fault. Now, let us take——

4701 Mr. Page: I don't know whose fault it was.

Mr. Mathewson: No suggestion or notice was given to us about a thing of that sort. If it had been, the thing could have been arranged. You cannot expect us to allow people to wander around our office around through these plants without authority or credentials.

The Witness: The young men telephoned about it, is all I know, and they sent the men away.

Q. Let us take the small purifier house, one set of four boxes, 16 feet by 25 by 3 feet 2 inches, 20-inch connections, 24-inch cups and 20-inch center seal supports and two hydraulic operator cranes on tracks laid on floor. You give a value of $13,464 as against $16,828 by Mr. Mayer, and besides that you suggest 10 per cent. for depreciation. Were not those boxes in good shape so far as you could observe outwardly?

A. No, they are somewhat damaged. The covers show signs or rusting at the water line, and I inpected those a little more carefully, and I thought a depreciation of 10 per cent. was not too much on that work.

Q. How many pounds did you assume there were of material in those items in the small purifier house?

A. I only calculated that small purifier house as minutely as the data would allow me to do. I could not get any closer.

Q. How many pounds of weight did you assume there were?

A. I calculated at 30 pounds to the square foot, 13,200 pounds with an addition of 10 per cent. for the flanges and sides, 82 feet and 3.16 feet, 15,540 feet, 67,290 pounds, I put the cover in at 10 cents. I took 8 pounds per square foot as the weight of the cover. I suppose that is in excess.

Q. How many pounds all told do you figure it?

4702 A. Well, there are different classes of work there. There is wrought iron and also cast iron and I am trying to separate it here. It is rather mixed up, because I did not expect——

Mr. Page: I suggest that he can give his computation right through, if you wish, it will be shorter.

Mr. Mathewson: All right, if it will be shorter. What I want to know was the number of pounds here divided into wrought and cast iron and what you computed the price per pound.

Mr. Page: Supposing you give your computation beginning as you have it there.

The Witness: That is the way I was figuring it. Wrought iron top and sides of cover, area 442 feet, sides 164 feet, 606 square feet at 8 pounds a foot at ten cents a pound, that is the data on the cover.

Q. How many pounds would that make all told?

A. I did not add the wrought iron into the other work. I do not do it and nobody does.

Q. I know that. I asked you to give me the number of pounds divided between wrought and cast iron.

A. You understand this is all on one box?

Q. Well, add it all together, wrought iron and cast iron together, and the price per pound at which you computed.

A. Cast iron I took at $80 a ton, four cents, $1,883.90 is the cost for one box, and it appears that $533.20 is the wrought iron work. That brings it to $9,535.60. Supports, $1,600, $11,135, and the frames, bulk, $1,009.60, making altogether $12,240.20 and I add on that 10 per cent., $1,224, making $13,464.

Q. Do you take 30 pounds to the foot regardless of the size of your cover?

A. Well, the cover I only take as 8 pounds, I took 30 pounds on the cast iron.

4703 Q. You did not get those figures from the Logan Iron Works, did you?

A. No, I did not. I did not get any figures——

Q. Would it not make a difference in your calculations if you were informed that Mr. Logan testified that those boxes would cost about $16,000 or practically what Mr. Mayer's figures were?

A. Well, constructor's figures are always a little safer on their side than the engineer's, and generally the engineer's figures are a little lower than a man who is taking contracts, yes. But I will say this, that I have made estimates on a great deal of work and I don't remember a case where the work was not taken at below my estimate, but they were made in a more careful manner than this, in regard to having drawings and absolute details throughout, which makes some difference. I did not have an opportunity to verify these measurements, and might have left some things out.

Q. You understand Mr. Logan did not have an opportunity to verify the measurement but simply took——

A. Well, he lumps things in his head, I know he does things pretty fast in his head.

Q. A very bright man, isn't he?

A. Very bright. I am not as bright as he is at figures.

Q. Consider the boiler house. One locomotive boiler 35 horsepower $1,400 you give as against $1,918 for Mr. Mayer. Did you give a valuation of that particular locomotive boiler and tubes or of a locomotive boiler and tubes which you thought would do the same work?

A. Well, I applied—a locomotive boiler does not differ one very much from another. It is just simply the name as applied to a boiler that has a locomotive fire box and a little more expensive construction than——

Q. As a matter of fact locomotive boilers produced by some concerns are more valuable in the market than locomotive boilers 4704 produced by others, are they not?

A. Oh, yes, there is skimping work done on all sorts of work.

Q. As much as 30 per cent. difference in the quotations of boilers of different makers?

A. A man gets a reputation for fine work, and he can charge a little more for it if he can get it.

Q. And the boilers of some makers seem to stand better and be more valuable than the boilers of other makers, don't they?

A. Yes. I have my preference in regard to makers of boiler works, and would give somewhat more for their work than I would for other makers.

Q. Take the valve house, 2 No. 9 American Meter gauges, 1 large American meter gauge, 1 No. 8 Bristol recording gauge and 1 Pressure indicator. You put them all together at an original cost of only $89?

A. Yes.

Q. As against $335 for Mr. Mayer. Now, did you price No. 9 American Meter gauges of any maker before you took the stand?

A. No, I have bought so many of those things I just took my own figures on them.

Q. What is the market price now for American Meter gauge No. 8?

A. Well, that means a 9-inch needle.

Q. Yes, nine inches?

A. Well, they make several grades of gauges. There is a gauge made for a photometer——

Q. Well, meter gauges made for the purpose for which these were used?

A. Well, that is a very ordinary arch gauge, and I put them down at $12 apiece. I did not put any depreciation on them whatever. I took them just as they were.

Q. Well, one large American meter gauge, is $45 a fair price for a large American meter gauge?

A. That was a large show gauge, you could see at some distance.

I don't think it would make that amount of difference. I
4705 put it at $20 including depreciation. I think it was just
made in that way to see a little further off.

Q. Can you name any concern which makes an American meter gauge of that size and quality for $20?

A. I don't think they would sell it new for that, no.

Q. Don't they sell them new for forty or forty-five dollars?

A. Yes, a first-class gauge.

Q. What concern would be the proper concern to get the price from?

A. The American Meter Company for the American meter gauge.

Q. Let us take No. 1, 8-inch Bristol recording gauge, how much did you allow for that?

A. I allowed $50 for that, that is $5 more than for my fine French recording gauge.

Q. The pressure indicator, how much did you allow for that?

A. $5.00.

Q. You allowed nothing for anything except for a lever or something which they——

A. A signal key and a ticker.

Q. You did not allow anything for the connection between that and the point where the indication was made?

A. I tried to do that. I asked the young man where the wires went and what there was of it, too, but he did not know beans about it.

Q. It certainly would be more than five dollars each if everything was considered?

A. It might have been. There might have been a mile of wire in there.

Q. And what it would cost to install that wire, or the method of its installation, you had no information of?

A. No, I tried to get it, but could not get it.

Q. Let us consider these coal gas stacks of 30 benches each and the
coal gas stacks of 24 benches. Where are there in the United
4706 States any regenerative furnaces in accordance with your
definition as to the change of air current from cold to hot
flues?

A. I don't know of any. I have not seen one—that is——

Q. Do you mean to say in modern construction retorts are not placed over one another?

A. That is a very poor construction.

Q. I did not ask that question. I asked you whether in modern present construction retorts are not frequently placed one above another?

A. They frequently are, but I am positive on that point.

Q. Don't you think there are as many with retorts one above another, as with retorts drawn in?

A I think on account of the way in which they are put in, I think it is likely there are as many, perhaps more.

Q. Is it not true there is an advantage in regenerative benches to have the combustion space between the retorts wide?

A. No, sir, on the very contrary.

Q. You think that is a disadvantage, do you?

A. Yes, you might as well——

Q. Is it not a standard construction, one retort above another if charging and discharging machines are used?

A. It comes handy for that purpose, but the charging and discharging machines can be used just the other way, only that you have to move the machine a little for the retort to accommodate putting it into the retort, where there is one right above the other, it is convenient for the men.

Q. It is more convenient to have them one directly above the other where you are using charging and discharging machines, isn't it?

A. It is a little handier for the men. I don't consider I would give up much for their convenience on that score.

4707 Q. Does it not make a great difference as a question of economy from installing new benches whether you are starting a plant *de novo* or whether you have an existing plant which is still in good working order?

A. Do you mean whether it is more economical to run an old plant?

Q. No, does it not make a great difference as to the question of economy from installing improved benches whether you are starting *de novo* or have an existing plant which is still in good working order?

A. There is a little trouble in starting up new works, certainly, but after you get it once gaited as we call it, and get the hang of it——

Mr. Page: I don't think you catch the question.

Q. No. But if you throw out your old benches you lose so much property, if they are in working order, don't you?

A. Yes.

Q. If you purchase new benches to put in their place, you are either increasing your capital or are presenting a large charge for depreciation which comes out of the consumer of your product finally, that is so, is it not?

A. The relation of the bench-work, I don't exactly catch the idea, I must say.

Q. If you have old benches and desire to substitute new when you throw away your old benches it is so much loss of capital, and when you put in your new business, that is a new expense, that is right, is it not?

A. That is the repair, all bench-work is charged to repairs.

Q. No, we are assuming the benches are discarded and not repaired. You suggested putting in some other form of benches. I say if we have benches which are still in good working order and you cast them out and put in a new type of bench you are losing capital, you are destroying it to a certain extent, are you not, and putting in a new investment? 4708

A. Yes, but the advantages are better in comparison with the disadvantages.

Q. But you are increasing your capital upon which you have to pay a return or else are charging a large sum to depreciation which comes out of the consumer of your product ultimately, is not that right?

A. Yes, but in this case we divide that. I find that the stack which had to be altered to accommodate an improved bench, and which has been altered there, by the way, in this very retort house, when you get in with the half depth bench, that when the stacks are rebuilt, they could just as well put in the very best setting as to put in their old setting.

Q. Yes, I am not defining the amounts, I am simply calling your attention to the fact, and asking you if it is not the fact that the installation of new benches is more of a problem where you have old benches installed and still in working order than it is where you are building a new plant with no old benches to discard?

A. Yes, it is to this extent, that you have to tear down in the summer time and rebuild your stack, and it is more troublesome and involves tearing down as well as building up. But as all economy in gas production has almost centered in the retort house, the gain is very much greater than any loss conferred on interest and on capital.

Q. You have said in New Orleans they obtained their 5.25 to 5.30 feet per pound from the coal there used. Is there not a great difference in the quality of the coal as to the production of coke?

A. Yes. I see the same mines entered into the quality of your gas coal as we used to get in New Orleans, apparently. There was a quantity of the same quality of coal.

Q. You have not tested any of our coal, have you?

A. No, you seem to have good coal.

4709 Q. Don't they use the same kind of coal here that they use in Newark when you were there, after you left New Orleans?

A. I visited Mr. Vanderpool in Newark many times, but I was not more than cursorily acquainted with the operation of the works.

Q. You did not have any part in the management of the Newark works?

A. No.

Q. How much per bench did you allow in these four coal gas stacks of thirty benches each?

A. For replacement?

Q. No, for cost, for reproduction now?

A. For putting in a new setting, I allowed $450. The mason told me that the Consolidated could buy material so much cheaper they could do it for $350.

Q. What mason was that?

A. Well, I don't like to involve the mason in trouble.

Q. I would really like to know because we would like to go to the mason and get our work much cheaper than other people?

A. That is the trouble. He said you could do it one hundred dollars cheaper. He said you get it $100 cheaper.

Q. I won't press you for the name of the mason unless you want to tell it, but I ask you to?

A. I don't know. They might go to him and might not.

Q. You have never done any masonry work in New York City yourself, nor never had a contract for any?

A. Not in New York City, no, sir.

Q. Well, go on then if you will, and finish the answer?

A. I say for renewal benches, $450, and for the stack or oven work and iron work, it would amount to about one thousand dollars a bench.

Q. Does that apply to a renewal and reproduction of the benches entire, including the arches?

A. That includes arches for thirty benches, yes, sir.

Q. The whole thing, benches and arches?

A. No; that is just the arches.

4710 Q. Well, how much per bench for benches and arches altogether? In other words, four coal gas stacks of thirty benches each, fifteen back to back, six retorts to bench, direct fire, 12 by 21 inches by 8 feet 6 inches, with an arch six feet, division wall 14 inches, and wall 3 feet 2 inches, length of stack 112 feet; what is the total for one of those benches, including everything that I have just recited, and the iron work, including setting?

A. $1,417, I think. I have not calculated it at per bench, but that figure appears to be the division by thirty of the total amount or the cost of the stack.

Q. You said the iron work cost $1,000, did you not?

A. The iron work of stack; the iron work of ovens or stack. We call a collection of ovens a stack, and that is including iron work. If you want the details: door, $180; mouth pieces at $25.00, $180; stand pipes at $10, thirty hydraulic mains at $60; thirty settings at $450; bars and door frames and ash pans make up the balance.

Q. So that your total valuation is $42,500 per stack?

A. Per stack.

Q. And four stacks I figure would be $170,000, do I not, instead of $160,000 which you gave?

A. You are right; there is a mistake there. Yes, $170,000.

Q. Are your prices based on New York labor prices for masons?

A. Yes.

Q. How much did you allow as a rate?

A. I took this from a man that did bench work for me here, a contracting man, and he offered to do it for that.

Q. What is the rate of wages?

A. I don't know what he paid his men.

Q. Do you know the rate of wages for men in New York?

A. For that kind of work I paid $6 a day.

4711 Q. Do you know what the rate is in New York City according to the Union—not the Central Union?

—. No, I did not go further than to find out from this contracting man what he would put in benches for.

Q. And you assumed, too, in this computation that the Consolidated Gas Company would obtain its material at lower than the general market price, did you?

A. $100. He stated that the Consolidated would obtain the material $100 less than he could get it; $100 per bench.

Q. Less than he could get it?

A. Yes.

Q. And you have assumed that in your computation?

A. No, I have put it at what he could get it, $100; they would save $3,000 on the job compared with what I computed.

Q. You have not made any reduction on account of the supposition that the Consolidated could get it for less than the usual price?

A. He was very fixed on that price. He seemed to talk very feelingly about it.

Q. You did not want to give his name?

A. I would like to. I will ask him, however.

Q. You have valued at $36,500 the one coal gas stack of 24 benches which Mr. Mayer valued at $58,800 to reproduce new. On what basis did you figure to get that result?

A. I put the prices on those benches at $1,500. I suppose that that is owing to a correction I made on the other from getting the amounts paid, and I suppose that would be—well, taking into consideration everything, about $100 in buying material; I suppose it would cover it, but I took that at $1,500. I know there would be more than that difference between that and the smaller retort; not much more. I think the advantage of the Consolidated in buying material would cover it.

4712 Mr. Page: Well, eliminate that, and if you have got to change your calculation, do so.

The Witness: The difference was in the calculation of the price of brick work laid. I have charged for No. 1 brick for building stack. I think I will make this $200 difference on a setting.

Q. So your $36,500 would be changed in that event to what?

A. $40,800.

Q. Now, that was reset in 1906 and you deduct nothing. Do you observe that of the other stacks one was wholly reset in 1904, two in 1905, and one-half reset in 1904?

A. Well, I never heard of benches being set in that way. They do not take and let down a whole range or benches because one "busted" up, they let down the ovens that are out of order, unless it is for isolating it, but drop it out as it becomes so that they cannot mend it.

Q. But, did you observe that statement in the schedule you have?

A. I observed that statement. I did not agree with any such manœuvering.

Q. Well, you do not agree with that statement, you do not believe that it is so; that is the point, is it?

A. I do not believe benches are renewed in that way.

Q. And if they were renewed within the last two years, sixty-four stacks, then there would be no depreciation such as suggested?

A. Certainly there would be a depreciation on running a stack; that is a current depreciation; that is allowing a long lifetime to such benches, of three years, and taking a number of them I think it is a moderate allowance.

Q. They seemed to be in good shape, didn't they?

A. Well, there were "all sorts and conditions" of benches there;

those that were dead, those that were getting that way, and some of them were ready to "give up the ghost," as I saw them, that were in operation.

4713 Q. That were in operation?

A. Yes.

Q. Those that are being used now in making gas were ready to "give up the ghost"?

A. Yes, they were about dying out, I judge that by the leakage of the retorts, shown by the gas coming out of the chimneys, and the condition of the front of the benches from throwing water on, quenching the coke, and quite a number of indications as to the state of the benches leaking in the retorts.

Q. At the same time you know they are producing more gas at the 14th Street plant of the required candle power than they ever did before in their history, or didn't you know that, in these poor retorts? Did you know that? Wasn't that your information?

A. No, I didn't get that information from what I saw there. I have been around retort houses too long. There is a third——

Q. And if it makes gas in large quantities and of the required candle power your theory is that it ought not to, considering their character?

A. It might have been worse than it is now. That is true. I do not dispute that.

Q. These figures that you have now given are your final values then as to these four stacks of thirty benches and the one stack of twenty-four benches, are they?

A. Yes, sir; subject to any error in computations. I have run over these computations only once and have not had time to verify any such great number of them, and I would like to have the privilege of going over the arithmetical part; but the basis of it is correct.

Q. You speak here of two tower scrubbers, 20 feet diameter by 84 feet 2 over all, and make some observations on the use of those scrubbers. Isn't it true that tower scrubbers are valuable in conjunction with so-called washer scrubbers, being used before the latter,
4714 for the purpose of taking out the carbonic acid and sulphurreted hydrogen by means of the ammonia?

A. Well, there is a rumor to that effect. I have heard a great deal of taking out ammonia with the carbonic acid that is in the gas and having them unite, but they fly apart, they do not stay in that shape. The ammonia is volatile. In fact, I do not think it can be claimed at all.

Q. Did you ever try that?

A. Yes.

Q. In your own experience?

A. Yes, I have been through that I guess about——

Q. Well, did you ever try tower scrubbers for that purpose?

A. I instituted tower scrubbers; I am the inventor of them.

Q. You do not mean to charge us with negligence in purchasing something you invented?

A. I put them in New Orleans first and they were taken to England and brought back here.

Q. And you think they are not a good construction?

A. I thought at the time they answered very well to take the ammonia out of the gas, but as far as saving the ammonia to the best advantage I do not think they do. The ammonia can be taken out by a better way.

Q. Now, did the $36,195 which you gave as the cost of reproduction, include everything in the "yard" at 14th Street, where the two tower scrubbers are? Does that $36,195 include everything except the foundations?

A. I took simply the weight of the scrubbers and the appurtenances as given here.

Q. My simple question is whether your valuation includes all the items under the term "yard" except the foundations, for which you gave a separate valuation? I assume that it did.

A. Well, the trays, I don't know whether that is calculated there. If those are iron trays I suppose it is included in the weight of the iron. If they are wooden trays, which I doubt, why they might be extra.

4715 Q. Now, let us take the next item, foundations, 4 feet thick, 34 by 64 and so forth, supported on 300 piles. What length did you assume for those piles in your computation?

A. I took them at $7 a pile.

Q. It makes a difference, the length of the pile, doesn't it, as to the cost of the pile and the cost of driving it?

A. Well, that is a pretty expensive pile. I took the highest price that I saw given for New York work in a number of instances where New Yorw work was mentioned. I will refer you to Gillette——

Q. How long piles did you assume?

A. The ordinary length of pile that it would take to support that weight. It depends on the friction of the ground. I suppose 35 or 40 foot pile would do.

Q. Did you assume a 35 or 40 foot pile?

A. No, I only assumed a cost of $7 apiece per piles.

Q. Did you include the cost of driving as well as the cost of the pile?

A. I took $3 apiece for driving the pile; sawing off, $150, timber capping, $450.

Q. In figuring the arches of your coal tacks, how many bricks did you assume that a man would lay of that character of work in a day?

A. This man told me that he would take it for that.

Q. No, that is not the question?

A. I put the construction up to him in sizes and dimensions, and everything about it and asked him what he could get the bricks for and lay it for.

Q. The question was how many bricks you assumed a man would lay in a day in that character of construction?

A. Oh, he would not lay more than—if he did it carefully he would not lay more than eight hundred bricks a day.

4716 Q. Did this man to whom you were talking, and whose name is not stated, see these particular stacks and arches?

A. He knows them well; knows all about them.

Q. Did you take him to see them?

A. No, sir.

Q. Is he familiar with them?

A. Perfectly.

Q. Now give us his name?

A. Well, it would not be fair for me.

Q. Did this man figure on using union labor, do you know?

A. This man is one of the best masons I know and I don't know whether he uses such labor as is current. I suppose he uses union labor.

Q. You don't know?

A. That is a matter I did not inquire of him.

Q. Referring to this Isabell-Porter scrubber in the scrubber house, your valuation for original construction is the same as Mr. Mayer's. Doesn't that seem to be in good condition?

A. Yes, the only thing about the age of that in depreciation will have to take place inside. I have given that a lifetime of seventy years.

Q. You don't know in any case, do you, or in reference to any piece of apparatus which you have valued to-day, how much had been expended in repairs or replacements or renewals on it by the Consolidated Gas Company since its original construction?

A. I know the general results.

Q. Won't you answer the question?

A. I saw the vouchers and repairs, and what they spent the last year, every one of them.

Q. (Question repeated.)

A. This identical apparatus?

Q. Yes.

A. Well, I don't recall.

Q. Well, do you know how much was expended in repairs or renewals upon any particular piece of apparatus that you have valued since its original erection?

A. No, I cannot say that I can identify where the repairs went; that is the trouble. We could not.

4717 Q. Well, you were not one of the accountants on the books, were you?

A. No, I was one of the Advisory Board of Engineers.

Q. Appointed by the Corporation Counsel or somebody else?

A. Yes.

Q. How many pounds of material did you estimate there was in the air condenser in the retort house annex, in computing your valuation of $15,067?

A. The statement I have here is 112 feet long and 8 feet——

Q. Your description is doubtless all right, but how many pounds did you assume?

A. Well, there are 163,050 pounds of castings in that part, that is the rectangular shape at the bottom; cast iron pipes 132 feet, 74,000 pounds. No, I made a mistake; it is 132.66, 20-inch pipes, 74,000 pounds; 264 flanged end on the pipe, and 264 flanges on the faced joints on the rectangular vessels in it, and the 6-inch cast iron pipe, 18,500 pounds. You see I have not allowed, therefore, for the flanges and that amounts to——

Q. Well, without going into great detail, Mr. Mayer's figures are about $1,000 more than yours, that is $16,335. Allowing for the flanges, his figures would be about right, wouldn't they?

A. We differ very little on that.

Q. Wouldn't you be willing to accept his figures as far as allowing for the flanges? Without special computation, was his about fair?

A. He computed from better information, drawings and one thing or another of that sort. I should, yes.

Q. Referring to the boiler house and well, one vertical boiler, 37-inch, 6 feet 9 and so forth, you computed $250 on the horse power. If you computed on the dimensions, would any different result be reached in your view?

4718 A. Well, I took a look at the dimensions and it seemed in excess of the thirteen horse power, yes, sir; but I did not compute it.

Q. Well, assuming the dimensions to control and the amount of material necessarily involved, assuming the dimensions to be right, you would not quarrel with the $350 valuation of Mr. Mayer, would you?

A. Well, I don't think it would make any such difference as that.

Q. Well, it would be $300 in that case?

A. It would be a lump figure. I would have to really calculate it.

Q. I know, but it is a small item and I only ask you generally.

A. I suppose the difference might amount to $50 on the size and being larger in horse power. Boilers are allowed in horse power at different rates.

Q. Does that include connections and erection?

A. Well, the price of the boiler includes all the trimmings and gauges.

Q. Does it include the erection or simply the delivery?

A. Well, that depends on how you make it.

Q. Yes, I know, but in your estimate?

A. Well, I considered that they deliver—that they will deliver a boiler for that; yes, sir.

Q. And then the erection would be something to be added by the company in the final cost, wouldn't it?

A. That is a vertical boiler standing on end, those little boilers like that, so I do not figure very much for erection.

Q. Whatever it is; it might not be much. Wasn't that boiler apparently in good shape, as far as the outside appeared?

A. There is a whole outfit of boilers which had a worn aspect; it looked as if they were pretty well along in life.

Q. In what way did they look worn?

A. Doors and such things as show the wear and tear, like furnaces, ash pans.

4719 Q. Was it in operation?

A. It had a banked fire in it.

Q. Then it looked as though it had been in operation?

A. It looked as if somebody was getting it in operation, yes.

Q. Look at the boilers above in the boiler and engine house; $1,100 for 55 horse-power engine you give, with a depreciation of $600. Do you mean to say if an engine had depreciated to between 50 and 60 per cent. it could be used with safety?

A. You can use an engine up to the time——

Q. This is a boiler.

A. Oh, a boiler. I thought you said engine.

Q. No, 50 horse-power vertical boiler. Do you mean to say you think that boiler if still in use would have depreciated $600 on that $1,100 original value?

A. Well, I thought the boiler was pretty nearly extinct, yes.

Q. It would be difficult, wouldn't it, to get an insurance company to insure a boiler after careful inspection if it was deteriorated as much as that?

A. It would. They would probably cut down the pressure that they would alow on such a thing as that.

Q. Did you learn what pressure was carried?

A. No pressure at all.

Q. It was not in operation at the moment you saw it?

A. No, sir.

Q. Now, about the 50 horse-power? Two cylinder——

A. I think this is a well—maybe I was mistaken on that.

Q. Under "boiler and engine house," the first item, one 55 horse-power vertical boiler, 5 feet 8?

A. Yes, I recognize that by that oscillating engine. It was the antique——

Q. I am talking about the 55 horse-power vertical boiler?

4720 A. The engine and boiler was certainly a very antiquated type. I have never seen anything in operation quite so old for many years.

Q. Then this was in operation, was it?

A. Well, I say that the oscillating engine was in operation. I took it for the well boiler, which is a boiler house and well just immediately beneath in connection with the well.

Q. Was this the boiler of that oscillating engine?

A. Yes. There was one engine there that took steam from across the road. However, that is not the one. They had a boiler but it did not boil; they were taking the steam from elsewhere.

Q. Now, in the boiler house below I have one boiler four feet by ten feet three; tools for coils, valued at $360 on the horse power, you say. Wouldn't that engine, taking its dimensions and the amount of material, be worth more than $360 if there is nothing said about horse power?

A. Yes, I think that would be a thirty horse power engine at least.

Q. And did you observe that Mr. Logan had accepted Mr. Mayer's figures as to valuation on that?

A. No, I did not look into Mr. Logan's figures at all.

Q. If he had, that would influence your judgment to some figures, wouldn't it, as to values?

A. I don't know. The more they agreed in values, the less influence it would have.

At 4:55 P. M. adjourned to December 7, 1906, at 10:30 A. M.

4721 Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,
vs.
JULIUS M. MAYER, as Attorney General of the State of New York; WILLIAM TRAVERS JEROME, as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIAN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and THE CITY OF NEW YORK, Defendants.

Before Arthur H. Masten, Special Master.

NEW YORK, *December* 7, 1906.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Page, Mr. Burr.

4722 Continuation of the cross-examination of HENRY H. EDGERTON.

By Mr. MATHEWSON:

Q. Under boiler house at 14th Street you valued one 50 horsepower, two-cylinder, oscillating engine, including cast-iron walk around the engine, at $1,700, but you deduct $700 for depreciation on the boiler of the engine. Did not that appear to be in good condition, so far as outward appearance went?

A. I think that depreciation was on the oscillating engine and boiler combined.

Q. I understood you yesterday to say that the depreciation was on the boiler, but I understand you to-day that it was on everything combined.

A. Yes, it was said to be built in 1882.

Q. Did it not appear to be outwardly in good condition so far as you could observe?

A. No, I could not say that it had the appearance of being in first-class order by any means.

Q. What was there out about it that you saw?

A. Well, I don't remember at present. I took the whole thing in conjunction; I thought it was the most antiquated arrangement I had ever seen lately, anyhow.

Q. Was it because it was antiquated that you made this deduction, or because it was physically deteriorated, so far as you could see?

A. A thing that had been in use that long, of course, had got internal deterioration that would not show altogether on the outside. We know that——

Q. But I am getting at what you saw, Mr. Edgerton, and not what you assumed was the condition on the inside. Is it not true that so far as outward appearances were concerned, disregarding the question of antiquation, that the machinery seemed to be in good condition outwardly?

4723 A. I don't believe that I could have put that depreciation on it unless it was in pretty poor shape, because——

Q. Can you tell what it was that attracted your attention as being out of order about it or as being worn out?

A. I think, in the case of that engine and boiler, I called the attention of Mr. Lacombe and Mr. Marks to the appearance; it seemed to me to be very much depreciated.

Q. I am trying to get at the exact feature which was not in good repair or in good order or showed wear and tear. In other words, what was it that seemed to be deteriorated or depreciated in your eyes?

A. Well, throughout, the oscillating engine had a worn-out appearance. I could not particularize in what particulars, because I spent probably ten minutes in looking over that thing, and still I could not at present, there are so many engines and boilers to examine there. I could not tell in what particular that I considered it out.

Q. That, I think, covers everything which you commented on at 14th Street regarding which I wished to question you, except the small holders. You speak of six small holders.

A. There were eight.

Q. Eight, yes.

A. Yes, six in one yard and two adjacent.

Q. You say those holders were used up; is that the expression you used?

A. I don't think I used that expression. I think that I stated that the holders were of such small capacity that they were of no account for a business so immense as the Consolidated.

Q. But, leaving that out of the question for the moment, were not those holders in good condition when you saw them?

A. Well, there were places where the tar had scaled off; it did not look so much out of condition, as I judged from the fact, 4724 being grounded, that one was blocked up to keep it from going down into what I took to be either mud or slime at the bottom of the tank. When I see a holder fixed so as not to allow it to settle down to the full extent on the blocks, I know that there is something down there that may possibly stick to it, so when they attempt to raise it it will make an extra pressure.

Q. Well, so far as the shell of the holder itself was concerned, it seemed to be in good condition, did it not, except that pieces of tar had scaled off here and there?

A. Yes, there is not any appearance of its being out of condition further than that.

Q. And you say they were being repainted with tar when you were there, is that right?

A. Yes, they were painting them with tar.

Q. You have no knowledge that those holders are permanently out of use, have you, or are not being used in the times of large production and output?

A. It is now a time of large production, and when I saw them out of use for several days, and knowing also that the using of them would be of no account for such a business as the Consolidated has, I took it that they were laid out permanently. Also, the fact that they had been settled down to the bottom of the tanks and the water line having been impressed on them for a space of eight or ten inches——

Q. Well, the fact they were being repainted with tar would indicate, would it not, that they had not been abandoned and put to scrap?

A. Well, I say this, that no one paints over with tar in the winter time; tar is a substance that is only applied to holders in the summer, on a hot day. We raise the holders on a hot day and apply the tar in order to let it bake there, and it is an extremely unusual thing—in fact, I have never seen a holder painted with tar in the winter time; it is so long in setting that it would throw the 4725 holder out of use anyhow. After a holder is painted with tar it has to be kept up long enough or else it will blister up when it is let down into water, and that alone would throw it out of use for the time it would take to dry off.

Q. And how long would it take to dry off?

A. If the tar was not thinned——

Q. Well, assume that it was thinned——

A. It was not thinned, this was daubed on, thick tar. It might take two weeks to dry thoroughly.

Q. Now, Mr. Logan states that the cost of reproduction of these holders to be $180,000, and Mr. Mayer says it would be $178,885. Is it fair to assume that the cost of reproduction of those holders would be about $180,000, as these gentlemen testify?

A. Holders and tanks? Yes, combined.

Q. No, but this valuation is given both by Mr. Mayer and by Mr. Logan as the cost of reproduction of those holders or tanks, the tanks being separate.

A. Then it is about twice too big, if that is the case. I have bids on holders now, including tanks, at that rate.

Q. How much do you calculate that those holders weigh?

A. Well, I have not made a calculation of the weight of the holders.

Q. How can you tell what the holders are worth until you know what they weigh and the amount of material in them?

A. We know very approximately the cost of a holder from the rate of its contents per thousand. Now, I have bids on a holder and tank erected at $100 a thousand capacity, smaller than that holder, and therefore that holder should be erected at $85 or $90 per thousand.

Q. We are talking about these particular holders. Do you know how much they weigh, or have you any figures as to what they did weigh?

A. I wanted to get that, and constructed a gauge on pur-
4726 pose, but they had those holders counter-weighted so as to cut
me off on that. If they would take those counter-weights off, I could tell very exactly, within two or three per cent.

Q. How about the guide frames which go with the holders, are they made of cast iron or wrought iron?

A. Cast iron columns.

Q. Would not they cost more than wrought iron?

A. They would cost somewhat more, and would not be as good.

Q. I am not talking about that. They would cost more than wrought iron, would they not?

A. I think they would. If you figure out those particulars, they would cost some more.

Q. What pressure did you assume these holders threw?

Mr. Page: You will remember that this witness did not value these holders.

Mr. Mathewson: No, but he said they were dead and out of use, and he rejected them.

Mr. Page: He did not have to calculate the pressure on a holder that was dead and out of use.

Mr. Mathewson: We will see about that.

The Witness: As I stated, I had prepared a very delicate gauge to take the exact weight of the holder, but the fact of their being counterbalanced prevented that being used.

Q. You have just said that these holders could be reproduced for half the amount which Mr. Logan and Mr. Mayer said it would cost to reproduce them?

A. Yes.

Q. Now, I want to know in making that reply what pressure you assumed these holders threw? You must have assumed something?

A. I went by the capacity of the holder in my estimate,
4727 and if they are an extra heavy holder, I should be obliged
to——

Q. If you don't know what the weight of those holders is, you cannot tell what it would cost to reproduce them, can you?

A. To reproduce them of that weight?

Q. Yes.

A. I assumed they were ordinary weight.

Q. If you don't know what the weight of these holders is, you cannot tell what it would cost to reproduce these holders, can you, Mr. Edgerton?

A. I know this——

Q. Won't you answer that question? I think that is perfectly easy to reply to.

A. I could not calculate to reproduce exactly the weights unless I knew what they were; that is plain enough.

Q. Do you know what the wages are for laborers and mechanics for holders in the City of New York?

A. No, sir.

Q. Now, you said something yesterday about tower scrubbers not being in good construction, if I understood you. Did you?

A. I said that they are superseded in their function to a great extent by a better piece of apparatus; that was the washer scrubber or rotary scrubber.

Q. Well, now, in order to get something easy, I have a book here published in 1903, entitled "Self Instruction for Students in Gas Manufacture, Published in London," in which it says at page 44——

Mr. PAGE: I object, unless it is shown to be written by some standard authority, some one recognized as such.

Mr. MATHEWSON: The balance of the heading is, "Being Answers to Questions based on the Ordinary Grade Syllabus and Gas Manufacture of the City and Guilds of London Institute, by Mentor, Second Edition."

4728 Mr. PAGE: You might as well bring in on the question of law this "Pocket Lawyer" they are selling on the street.

Mr. MATHEWSON: That would be better than some law we get.

Mr. PAGE: That is undoubtedly so, but, nevertheless, I would rather take my law from Mr. Mathewson than from a book which was bought on the sidewalk, with no name on it, and it would undoubtedly have more weight. As I understand, you can refer on cross-examination to standard publications that are published of statements of well-known authorities, but anonymous publications set up as scientific works, I do not think can be used.

Mr. MATHEWSON: Well, it appears from the preface that the editor of the *Gas World* arranged with a gas engineer and chemist of knowledge and experience to write for that journal, that is, the *London Gas World,* a series of articles on self-instruction for students of gas manufacture. These have here been brought together in book form, so it appears that is, in book form, articles which appeared in the *Gas World,* and my friends on the other side have introduced the *Gas World* analysis of accounts as being something to bank upon. I think perhaps it is sufficient so I can ask questions about it.

The MASTER: Does it appear that the witness ever heard of that publication?

Mr. MATHEWSON: I don't know whether he has or not. It is published by the *Gas World* of London.

Q. You have heard of the *Gas World* of London, haven't you?

A. Yes, sir.

4729 Q. That is a very important and standard publication, isn't it?

A. Yes, sir; but I have not been perusing instructions for students lately, anyhow.

Q. Referring to this, I find this statement at page 44: "The tower scrubber, a sketch of which is shown in the figure upon page 45, is the apparatus most commonly employed in the elimination of ammonia." Do you still think that it is not commonly employed for that purpose, or most commonly employed for that purpose?

A. That would depend on whether they wanted to save their ammonia or simply wanted to get rid of it out of the gas.

Q. That is not the question. I ask you whether you still maintain that the tower scrubber is not the apparatus "most commonly employed in the elimination of ammonia"?

A. I don't believe there is a dozen of them in the United States.

Q. Then you do not agree with this?

A. No, I do not.

Mr. PAGE: That is English construction; maybe in England it is.

The WITNESS: In the first place, I have——

Q. Don't they use this most commonly in England?

A. In England it is still used quite commonly, because the smaller towns want to get rid of ammonia without going to the expense of trying to save it. It is a question of——

Q. However that may be, don't they get more ammonia from a ton of coal in England, as a rule, than they do in the United States?

A. I think they do, but they do not get it out of that scrubber.

Q. In spite of the fact that this is the form of apparatus most commonly employed in the elimination of ammonia, is that right?

A. Well, elimination and saving ammonia are two different things; you can eliminate a thing without saving it.

4730 Q. Passing that distinction, did I understand you to say that ammonia did not combine with carbonic acid?

A. Not a bit of it. It combines, and then any sort of a reagent coming in contact with carbonate of ammonia will throw it out of combination. I have experimented a good deal in trying to wipe out ammonia in gas by means of carbonic acid, which is also in the gas, and making it stick together, but I never——

Q. Then ammonia will combine with carbonic acid gas, won't it?

A. It will not stay there; besides, carbonate of ammonia is a volatile thing, and goes along with the gas——

Q. Will ammonia combine with carbonic acid gas?

A. It will combine with carbonic acid gas, and then afterwards disappear in the form of vapor.

Q. It will combine with carbonic acid gas, will it not? That is the question, because I understood you to say yesterday it would not.

A. Not combine and stay there in the form of carbonate of ammonia. It is not eliminated——

Mr. PAGE: Was your question general, or limited to the gas?

The WITNESS: If you want to go into the chemistry of the thing, I will follow it up.

Q. No; my question was as general as your testimony yesterday on the subject, in speaking of scrubbers. Do I understand you to say that you were the originator of the tower scrubber?

A. Yes, sir.

Q. Where did you first instal a tower scrubber—in New Orleans?

A. In New Orleans.

Q. That was in 1873?

A. In 1873; plans were made in 1871 and 1872.

4731 Q. Was it not in 1872 that Mr. Forstall saw you in reference to plans for New Orleans, the fall of 1872?

A. No, I had the plans finished in 1872. He saw me in 1871.

Q. Sure about that?

A. Oh, very sure. I can give you the exact place where I met him and the correspondence on the subject.

Q. Where did he meet you in reference to the designing of these works?

A. Fort Wayne, Indiana.

Q. Fort Wayne, Indiana?

A. Yes, sir.

Q. Was he alone when he met you?

A. He was alone. I don't remember——

Q. Was not his son with him?

A. His son was a baby then, pretty near.

Q. Was he a baby then?

A. Well, he was not anything very big when I first saw him.

Q. Was not this young man here, who is Mr. Forstall's son, with him, when he saw you?

A. No, sir; Mrs. Forstall, I think, was with him, but there was no son.

Q. Now, I have a book here, printed in London in 1878, entitled "*King's Treatise on the Science and Practice of the Manufacture and Distribution of Coal Gas*," edited by Thomas Newbigging, C. E., member Institute Civil Engineers, author of the *Gas Managers' Handbook*, and W. T. Fewtrell, F. C. S.; you have heard of that work, haven't you?

A. Oh, yes. I had a copy of it 35 years ago, nearly.

Q. And there seems to be a history of scrubbers here. I find on page 366 the statement: "In 1848 Mr. F. C. Hills obtained a patent for an apparatus of a somewhat complicated nature, in which the 'tower,' the 'tumbler' and the 'revolving perforated arms' also cropped out;" and it appears that in 1871 Mann & Walker obtained a patent on a tower scrubber, and the tower scrubber itself, with the legend "Mann & Walker's Patent," is pictured at page 371. Now, if that be correct, isn't your assumption wrong that you introduced the tower scrubber in New Orleans in 1873 first, and that the idea was
4732 then transported to Great Britain?

A. No, sir, I don't think so. I have obtained patents on things that have not been made, and that tower scrubber was not constructed in 1871.

Q. It appears, does it not, that the patent was obtained in 1871?

The MASTER: That is what he said.

A. The patent may be obtained. That does not construct the scrubber.

Q. Then the idea of the tower scrubber or the theory of it you do not claim was originated by you the first of any one in the world, do you?

A. No, although I thought of the tower scrubber long before I built it, I can tell you that.

Q. Did you get any patent on it?

A. No, sir, I didn't think of patenting it.

Q. It appears at page 366 that the tower was employed by Mr. Hills in 1848. Was that before you thought of it?

A. Yes. It depends on what term you apply to a tower or what they mean by it. Some men might call—the idea is simply this, that the old construction of scrubbers limited them to a very limited height, and I called Mr. Forstall's attention to the fact that I had long figured that it would be a great deal cheaper and better to continue those up to a great height instead of limiting them to nine or ten feet; and I wanted to put it outdoors in New Orleans, but they thought that was too much of a novelty; but we put scrubbers thirty-three feet high, and at that time it was considered an entire novelty in the business by everybody.

Q. Now, it appears at pages 371 and 372 of this work that the Gas Light and Coke Company requested Messrs. C. and W. Walker to communicate with William Mann in endeavoring to improve the scrubber, and it appears that the first scrubbers 4733 constructed at the Beckton works were made of wrought iron boiler plate, twenty feet diameter and thirty feet high, being parallel cylinders from bottom to top; and I am informed that the scrubbers at the Beckton Works were erected in 1869 or 1870. Have you any knowledge on that subject?

A. I don't think the Beckton Works were completed at that time.

Q. Well, it appears in the following paragraph that soon after—that is, after the Beckton Works were constructed, the efficacy of scrubbing became the object of much consideration, and in 1871 a patent was obtained for improvements, which is the Mann patent to which I have referred.

A. No. In 1871 I had drawn it out and was engaged in getting it under contract. It follows that frequently after a thing is successfully introduced in this country, like compression of gas for cars, that it travels over to the old country, has the stamp of approval, and then there is always some Englishman crops out who thought of it before.

Q. But your first scrubbers were erected in 1872, here?

A. Yes.

Q. So that if they were erected in Beckton in 1869 or 1870, that was certainly some years before you erected any tower scrubbers here?

A. I disagree with you about the time of erecting them at Beckton.

Q. Well, assuming that to be so——

A. Yes. Assuming they were constructed before they were, yes.

Q. Assuming they were constructed at Beckton in 1869 or 1870, that was several years before you erected any tower scrubbers anywhere, wasn't it?

A. It was, but my recollection is pretty definite that the construction of the Beckton works was completed after those scrubbers were erected.

4734 Q. But you observe, do you not, the point to which I call attention, that it was some time afterward, in 1871, that the patent was obtained? That is, after the Beckton works had been constructed?

Mr. PAGE: They invited these two men to co-operate.

Mr. MATHEWSON: And then they say that the first scrubbers constructed at the Beckton works were twenty feet diameter, thirty feet high; and the following paragraph states that soon after the efficacy of scrubbing, and so forth, was considered, and in 1871 a patent was obtained, evidently after the Beckton scrubbers were erected; and the Mann & Walker patent, as you know, was obtained in 1871, and was a patent for tower scrubbers as shown in this cut.

The WITNESS: Yes; it does not make any difference about the precise form of the scrubbers.

Q. But it would appear from that, would it not, that the Beckton scrubbers were erected before 1871?

A. I don't think so.

Q. All right.

A. I think the Beckton works were finished after I finished mine.

Redirect examination by Mr. PAGE:

Q. What months are the months of largest production in a gas works?

A. Well, the months of November, December and January are the months of largest production in almost all localities.

Q. Well, applying that to the New York conditions that we have heard so much about, would that be so here?

A. Undoubtedly.

Q. And the highest load for the year has to be carried by the works in those months, does it?

A. Yes, sir.

4735 Q. And at that time is the entire apparatus that is feasible for use and maintained for use in use?

A. Everything is supposed to be in action at the time of the largest output.

Q. Well, in regard to the gas holder, if a gas holder has been abandoned for use, you would still keep that holder in sufficient repair so that it could be used in case of emergency, would you not?

A. Yes, sir, particularly if my holder capacity was only about two-thirds of the day's output.

Q. Now, this oscillating engine and boiler that Mr. Mathewson questioned you about, that was stated to have been built in 1882. Is there a depreciation that is recognized by engineers on engines and boilers, based on the average life of the apparatus?

A. Y-s, sir.

Q. And although an engine or boiler may be kept in good condition in outward appearance, still would it be depreciated by the fact that it had been in use for a number of years?

A. Yes, sir; it is bound to be depreciated beyond what is visible on the outside; the wear and tear in the cylinders, and the pistons and valves become out of order; and, although an old engine may be kept in apparent repair and good condition, it is still given out throughout.

Q. Was this taken into consideration by you when you made your valuation of depreciation, or was it based entirely upon the physical appearance?

A. I took both. Where I saw a boiler and engine not only having the appearance of considerable age, I also took into consideration the general appearance of it in regard to its repairs.

Q. Now the "built in 1882" seems to refer to the boiler. What would you say, from the type of the two-cylinder oscillating engine, as to its probable age?

4736 A. Well, it was the most antiquated appearing thing in construction that I have seen in New York City. I was wondering where it could have been got from. I don't know anybody that builds such an engine nowadays.

Q. Is it a type of engine that is being built today and commonly used?

A. No, the last oscillating engine I ever saw was on a steamship about forty years ago, in use.

Q. Until you saw this one?

A. Until I saw that.

Q. This is a general question: when you throw out the old benches and build new, what is the process? How much, I mean, do you have to tear down and how much do you build?

A. Well, if we have an old form of bench in which the oven is not wide enough to make the modification required, we have to rebuild a stack, and in my opinion a stack should be rebuilt every fourteen years anyhow, unless it is an extraordinary well built stack; it gets out of order and chinks in the brick work—cracks, that cannot be very well daubed up and kept tight and leakages in the bypassage in the draft, and, therefore, the stack itself should be rebuilt before it is entirely dilapidated.

Q. Well, take it that time; say once in fourteen years or thereabouts, you would tear down the whole stack, wouldn't you?

A. I would tear down the stack and rebuild it on account of the difficulty of keeping them in efficient condition.

Q. What about this operation that you referred to that ought to be done once in about every three years?

A. That is rebuilding the ovens with retorts; three years would be a long average lifetime.

Q. What do you do at that time?

A. At that time the retorts are taken out and all blocks taken out and fire-brick to the level of the ash pan; sometimes a course or two above the ash pan may be left in up to the bearing bars; it depends on how much it is racked, and it is built up from that point.

4737 Q. Now, that removes everything then inside of the arch, does it?

A. Everything.

Q. Then if the company desired to change their construction and make modern benches at that time, it could be done with comparatively little additional expense, could it not?

A. Yes, I have seen changes of that kind. The size of the oven might limit the size of the retort, and in this case in 14th Street I see they have retorts drawn in; but the time to make a thorough improvement is in the summer time, by tearing down the stack, that is not a very expensive operation and it would be well repaid in a very moderate time.

Q. Now, the time having arrived at which it is necessary to reset the bench, you say with a comparatively little additional expense you could rebuild the stack?

A. Yes. The rebuilding of the stack is nothing formidable.

Q. And this work is done practically every summer, is it not?

A. Some of the retorts are reset each summer? About one-third would naturally be renewed in each year.

Q. Then without interruption of the supply of gas, inadequate apparatus could be changed to new apparatus in three summers, could it not?

A. Yes, perhaps even more rapidly than that if it was a matter of importance.

Q. I mean without changing the time that is now taken for repairs and that is without laying off any more of the apparatus than is now laid off in the summer for repairs?

A. That is right.

Q. Outside of the oven how much is there of a stack—of about what proportion of value does that bear, can you tell, to the whole stack?

A. It would depend a little upon the thickness of the division of the walls.

Q. Well, take this division that you have at 14th Street, which you have worked out, I understand?

4738 A. Yes; it would be about one-third, a little over; perhaps one-third of the expense would put in new stacks.

Q. About one-third additional expense?

A. Yes.

Q. Then if this fund that has been spoken of as a depreciation account that has been utilized by extensions, mains and building new apparatus, had been expended in those retort houses, some portion of it, it could have been changed into a modern up-to-date construction, could it?

A. I think so.

Q. And when I refer to the depreciation I mean the depreciation which Mr. Mathewson assumed was to be charged as against this apparatus, but had been expended in extensions and plants.

Mr. **Mathewson**: "New construction," I think was the term I used.

Mr. **Page**: Yes.

A. Yes, I should expend the money in putting in the very best order the generating plant as of first importance.

Q. How about this $280,000. I think it was that was spoken of as having been charged off to depreciation by the Consolidated Gas Company in the year 1905. Would that have been sufficient to rebuild this?

A. That would have been sufficient to have built a very much superior construction to what they have for an output such as they now make.

Q. What kind of a construction would that have given?

A. Well, that would have given a construction that would have minimized in use of coke and the output per bench, output per man.

Q. Still that does not state what kind. You say it would give a construction that would result in these economies, but I say what kind of a construction could they have put in?

4739 A. They could have enlarged their ovens, perhaps it might have been necessary to have dropped one of them or used more at the ends to have accommodated the larger sized oven and the larger sized retort, just as they did in the case of this setting of 24 benches. Twenty-four benches occupies the space formerly occupied by the setting of 30 benches. By a proper setting of larger retorts they would make very nearly the economy of the best plants.

Q. Well, would that give you a "generative" fire, as they have got it here. I suppose it should be a regenerative fire.

A. No, it would not be possible to put in a full depth of generative bench there without considerably more expense.

Q. No, I mean by that, the kind of a bench they have got here, 24 benches is put here as "generative" fire. I believe you said it was a modification of a half depth.

A. Yes, it is a half depth; it is not a full regenerative fire. It is one that would undoubtedly economize on the use of coke, but owing to the retorts setting one directly above the other, I think that it would not have any good——

Q. No, you are speaking of this particular one now, about that construction; but I say you could build a half-depth regenerative modern retort?

A. Yes, a very good and efficient bench could be put in in that space.

Q. And it would effect a large saving in the cost price of gas, would it?

A. Yes, sir; a very large saving could be effected by increasing the amount of coal gas and diminishing the amount of——

Q. No, but what I am speaking of is, would it be a saving over the cost of coal gas produced by that plant, over the plant which they are operating now. These four stacks of 30 benches each?

A. Yes, sir; a very large saving could be effected.

4740 Q. Now you stated in answer to a question of Mr. Mathewson that the retorts drawn in as you have shown made a more efficient bench that where the retorts were placed on- above the other. Will you explain why?

A. I examined very fully into that question when I built the New Orleans plant, and it arose in this way, that we thought that many benches of six retorts did not give the result of my old Ft. Wayne setting with five retorts, and that led to an investigation as to the cause of the five retort bench, giving a greater production per bench and per man that a six retort; and I visited the Nassau and Brooklyn and other works, having the one retort over the other of large size and arrived at the conclusion that it was a mistake to leave the large open space above the fire unprovided with a retort capacity, and the only way to avoid this loss in a bench of sixes would be by drawing in the retorts as they went upwards in the bench until we have them within four to six inches of each other at the top, and the result of the setting was to give—a largely increased yield.

Q. That is particularly so, is it not, in the direct fire bench where you have the retort come in direct conflict or contact with the heat or flame, if it reaches that height? I do not suppose it does.

A. The retort gets right in direct contact with the radiation of heat from the direct fire. I can illustrate it in a simple way, that if you wanted to boil a pot on the stove you would set it over the fire instead of putting it on one side, and the temperature of the gases arising directly off the furnace is higher than after it has lost by radiation going up the arch. I think, however——

Q. How is it with the regenerative apparatus where they have a chamber for combustion of coal gas and the air gas?

4741 A. Well, it is the same in that respect only I think care has to be exercised, because in managing a regenerative fire it is possible to melt everything down. I have seen arches in Washington at the gas works with the tile all doubled up with the heat, arising from the fact that you can push a regenerative fire to a tremendous temperature; but it still holds good that you want to fill up your bench space with retorts as closely as possible to get the greatest output out of the bench.

Q. So that from your experience of both types of apparatus you think that the best construction is the one with the retorts drawn in rather than the retorts set one above the other?

A. Most decidedly. It is illustrated right down at the 14th Street works. They have a new and enlarged retort set one over the other and they are lying there dead. They have been completed and had no fire in them, whereas they are firing smaller retorts which are drawn in and keeping them under fire, and keeping this improved bench with a regenerative fire out of use, and they have discovered rather too late that they were not set in right, I presume.

Q. Mr. Mathewson cross-examined you to quite a large extent upon your method of selling gas in Danbury and something as to the prices that you charged. Your remarks given here on the cost of production were not based upon the Edgerton process of gas production, were they?

A. No, sir.

Q. I mean cost of production applied to the 14th, 21st, 44th, 99th Streets and Central Union stations?

A. No, sir, I think possibly the examination in regard to the price charged for gas in Danbury has left the subject somewhat muddled.

Q. Yes, I was going to ask you if you desired to make any further explanation. I did not understand very well what your method of charge was, and I do not know as it has become very clear upon the record just what the theory is, so will you state it?

4742 A. The theory is in regard to charging for high candle power gas that every candle is worth as much as any other candle; a candle of fifteen candles is worth fifteen; a candle of eighteen candles is worth eighteen; a candle of twenty candle power is worth twenty; each candle is as good as the other with proper burners; therefore, when Danbury gas was put at forty-four candles of course the high price per thousand feet would not suit, it would bring a prejudice of the customer against the gas, and therefore we stated the price at so much an hour and registered the hours of gas burned for fourteen candle light. Now, it takes only two feet of gas at Danbury to supply the same gas that is usually supplied by five feet of coal gas, and therefore the actual price per thousand to the consumer is higher but it has always been rated to the consumer and stated to him at a coal gas price, so he could compare his price at Danbury with prices elsewhere. That method was very satisfactory, and the same was employed at New Orleans and it was one of the most popular features in connection with the introduction of high candle power gas, because it reduces the cost directly to dollars and cents so the consumer knew what he had to pay for a given light without having to compute it by means of cubic feet. Very naturally the system was attacked to delude the consumer——

Q. Never mind that part of it. What is the effect on the bills of the consumer?

A. The effect is the bill to the consumer is less. The average output in Danbury to a consumer is 9,000 feet of gas per year, and the average water gas in Massachusetts of a number of towns of similar size would be about 19,000, and the coal gas about 23,000. In fact, the consumption of gas goes on in the ratio of the candle power always.

4743 Q. The bigger the candle power the less the consumption in cubic feet?

A. The greater the candle power the less the consumption.

Q. That is, what the consumer wants is illumination, and if he has a low candle power gas, he has got to use more gas to obtain that illumination than he could obtain with a small quantity of high candle power gas?

A. That's it exactly. The common idea of candle power is very erroneous, as it is generally supposed that a thirty candle power gas would be twice as bright as a fifteen candle power gas. As a matter of fact, the thirty candle power gas does not show any brighter at all, or very little brighter, than a fifteen candle power gas. The consumer uses only half of it to give the same light. That is really the practical effect of candle power in gas. That is demonstrated very completely in comparing the output of the Scotch Gas Companies with those of the English Gas Companies. The average bill in Glasgow being about $18.00 and——

Q. You haven't those papers here, have you?

A. No.

Q. Well, we won't go further into that. I was going to examine you later on this question of candle power. All I want to know is just exactly what the theory of the Danbury was?

A. It is simply that stated, that gas is valued on the candle power on the basis that one candle is as good as another.

Q. The cost price of coal gas is somewhat regulated by the price that you received for your residuals, is it not?

A. The cost price of coal gas is almost dependent upon whether you have a favorable market for residuals or whether they are properly marketed.

Q. What do you find on an examination of the prices received by the Consolidated Gas Company for its coke as compared with
4744 other cities that you have had experience with, and their statistics in the regard to which you have examined them.

Mr. Mathewson: I object to this, Mr. Master. What you can obtain for coke in other cities is absolutely no criterion of what you can obtain in any other city. You can obtain in some cities, for instances, as was testified, in Chicago, $5.50 for coke. It is utterly impossible, as everybody knows, to get that price here. It seems to me that what you can get for coke some other place where the competition with coal is different and other features come in, is absolutely valueless as evidence here. It is what coke can be sold for in New York City, not what it is worth in Chicago.

Mr. Page: If it can be sold for $6.00 in Boston, I suppose we would be entitled to know it.

Mr. Mathewson: That may be. It may be that the competition there with anthracite coal is different.

Mr. Page: Or it may be they apply better business methods to get their market for coke and to hold their market.

Mr. Mathewson: They cannot apply any better business methods than we do here.

Question allowed. Exception.

A. I have uniformly found that the handling of gas coke to advantage is dependent upon looking up the market adapted for it. I have seen in a number of places where I have been called into consultation about works that they have had piles of coke on hand and selling it at low prices. My experience with coke as fuel is such that I am perfectly satisfied that gas coke of a fair quality, usually rates $1 a ton higher than anthracite coal at the same point.
4745 It is a perfectly smokeless fuel, it ignites with facility, so that it requires scarcely more draught to burn coke than to burn charcoal, while anthracite requires a heavy draught, and it is a common thing to see coke burning as fuel with a draught no higher than two feet. The best and most important market for gas coke is for household use and heaters. For that purpose it is twice as good as anthracite coal, but in very few localities do you find people who understand the handling of coke in a household heater or what is commonly called a furnace. The fact that it requires so much less draught is apparently against it by those who handle it for they leave the draught open and burn it too fast. The fire box of the furnace wants to be kept jammed full of coke, kept up, and the draught manipulated in such a way that you have barely the width of a penknife blade in cool winter weather of draught at the bottom, and in that way you get a fire that consumes the fuel on the spot; the gases are all burned. A little draught is admitted above——

The Master: Isn't all this a little beyond the scope of your question, Senator?

Mr. Page: I think it is.

The Master: Unless you show that people are educated up to that. The witness admits that most people do not know about it.

Q. Then if you were handling coke in a city where they had not been instructed in this, you would apply the same methods that have been used in the introduction of gas stoves by educating the people somewhat in their use.

Objected to as improper, as to what the witness would do under similar circumstances.

The MASTER: I do not think it is very important. Does 4746 not that follow as a matter of course?

Mr. PAGE: The only point I was making was that the company had devoted a great deal of time to the education of the people in gas stoves but they have not done anything with their coke, have not sought any market for their coke or tried to make a market for it.

The MASTER: That is a matter of argument.

Q. The use of coke is not confined to that of household fuel, is it?

A. No, it is a fuel that I have introduced without difficulty into a number of other uses than the furnaces and heaters, boilers. Laundrymen, of course, take it. Brewers are very good users of coke. I raised the price of coke to a brewer in Butte from six dollars a ton to nine dollars a ton by simply showing him how to stop wasting fuel. Also in public buildings. I have never had any trouble about introducing it to any use where they have janitors who will take the trouble to manage it rightly. As an illustration, a house can be heated with five-eighths the pounds of coke that can be heated by anthracite. I have made experiments in that. I got rid of the coke not only for the companies I was connected with but for neighboring companies. Take the case of Minneapolis: they had an oversupply of coke and were selling it very cheap and could not get rid of it. I brought carloads down and introduced it in neighboring towns just to break up a corner on anthracite when anthracite was high, and when they found out how to use coke it made quite a permanent market.

Q. I think in answer to a question by Mr. Mathewson, in regard to the Consolidated buying gas, you stated that they bought gas at a higher price than they manufactured it?

4747 Mr. MATHEWSON: No; than the 31.05 cents which he said was the average of the water gas stations.

Mr. PAGE: Well, at a higher price than the 31.05?

Q. Assuming that this operation of the Consolidated goes through with its subsidiary companies as a purchaser of gas, do you find that they do pay more?

A. No, my recollection is that deducting their own profit on their own product they pay less than these other companies.

Q. Your attention was called to Exhibit 79 by Mr. Mathewson, and you started to make an explanation in regard to the figures. If you desire to explain what you said at that time you may do so?

A. The point I wished to call attention to at the time was based on the idea that it was a matter of indifference whether the money from a depreciation fund was spent on one part of the plant or whether on another. It amounted to the same and they had the same results, whereas the money that they spent should be on those parts where the depreciation mostly occurs and where it is most important to spend it. As an illustration, the money spent in extension of mains is not as important as it would be in decreasing the cost of gas production at such stations as 14th and 42d Streets, but to make a more crude illustration: A man's doors and windows have gone out of repair; it would be more important for him to spend his money repairing them and in keeping them in order than it would be to buy a horse and buggy. It might not be the same outlay but it would be more important.

Mr. MATHEWSON: That is a very close parallel.

The WITNESS: That is not overdrawn. Perhaps I might 4748 draw a better parallel, but that in a rough way served to illustrate. Certainly if I knew how to make gas at thirty cents a thousand I would be loath to continue to manufacture at thirty-eight cents.

Mr. MATHEWSON: I do not think that was part of the question, but I am not going to move to strike it out.

Q. I just asked is there any further explanation? At the time you started to make some explanation and Mr. Mathewson stopped you?

A. I have forgotten now. I think that was the point, that it was a matter of indifference where it was spent.

Mr. PAGE: That is all I wish to ask Mr. Edgerton on what might be called the redirect on the subjects covered, so if you have any re-cross-examination on this subject you may proceed.

By Mr. MATHEWSON:

Q. Referring to these stacks, you said that you fixed the cost of a bench to $1,417 and the setting only $450, so that when you come to reset your benches that would not renew the iron work, which is the greater part of the value of a bench, would it?

A. Well, the iron work does not require renewing only to the extent that any modification made in the location of the retorts might require modification. You could accomplish that without throwing out everything in the plant.

Q. If you change the relative location of the retorts, it requires entirely new iron work, doesn't it?

A. No, I don't think so.

Q. Do you mean to say that it would not require entirely new iron work if you had drawn in instead of one over another?

A. No, sir; it would require modification of the iron work, 4749 it would require a new location of the dips and on top of the hydraulic, but I think that a great deal of the iron work could be utilized. Of course if one did not regard expense at all he might throw it all out and start new, but——

Q. You have said that the cost of coal gas depends in considerable measure upon what you get for the residuals. That means particularly what you get for your coke, doesn't it?

A. Coke, tar and ammonia, but the coke is the principal thing.

Q. Now anthracite coal in the West is higher than it is in the East, isn't it?

A. Somewhat, yes, sir.

Q. And coke sells for a higher price in the West than it does generally in the East, doesn't it?

A. Generally. I have seen coke sacrificed in the West at just such prices as in New York.

Q. Don't you know that the price for coke in Chicago at the recent investigation there was stated to be $5.50 per ton?

A. I think I saw something of that kind, yes, sir.

Q. And have you not known that coke sold in various cities in the West, such as Milwaukee and others, as high at $5.75 a ton?

A. That is where they had worked up a market, yes, sir. Ordinarily it is sacrificed the same as here.

Q. No matter what the reason is, the point is it does sell for those prices, or has sold for those prices; is not that right, according to your information?

A. No. I bought coke in the West at six cents a bushel at Minneapolis. That would be as low a price possibly as here. But the price of coke depends entirely upon the demand for it, like anything else.

Q. And it has sold as high as the prices I have indicated, has it not?

A. Yes, sir.

4750 Q. And does not the gas coal in the West cost less than in the East, say in Chicago and Milwaukee and cities of that kind?

A. It depends how far West and what coal you use.

Q. Gas coal such as is commonly used in Chicago and Milwaukee and neighboring cities.

A. I think in an equal distance from a coal region it is about the same.

Q. Don't you think gas coal is cheaper there than it is in the East, generally speaking?

A. No, I don't think it is. I have paid for gas coal in the West as high as $5.50 a ton for good gas coal. It is more a question of railroad freights.

Q. And don't you know that in selling coke we have in the East to compete with pea coal, whereas in the West the competition is between coke and the larger sizes of anthracite?

A. And natural gas.

Q. Yes, and don't you know that wherever coke is sold that it has to be sold at a lower price than anthracite coal in order to make a market for it?

A. No, that is the very point I made. I can make a market for coke that will sell large quantities of it a dollar higher than anthracite coal.

Q. Is not the labor of handling coke, as compared with anthracite, much greater on account of the greater bulk and greater care required in handling it?

A. I don't think there is any particular difference. There might be a slight difference. It shovels a little easier.

Q. Will you give me the name of any management in the United States, any company, that has been and is able to get anthracite coal prices for coke at that place?

A. Yes indeed, I can. That is just what I was getting at.

Q. Let us know what the company is.

A. Well, in New Orleans I bought anthracite coal at $7 a ton.

Q. That was in 1873, wasn't it?

A. No, that is when we changed to water gas in 1884 and——

Q. In 1884?

A. Yes.

4571 Q. Let us come down to within the last ten years.

Mr. Page: Let him finish his answer.

Mr. Mathewson: Very good.

The Witness: There I had an excellent coke market well established and worked up, and coke was sold at $5 a load. Now that coke in weight would produce a price higher than anthracite coal right there in New Orleans, and they were begging me for it to that extent that people waited for it to be drawn out of the retorts in order to get a supply many times.

Q. Why did you change to your oil gas process then if you were getting such enormous prices for your coke, which would reduce the price of the coal gas?

A. That was the very thing which entered into consideration and was fully considered.

Q. You know New Orleans has not made any coal gas for eleven years, don't you?

A. I know that. I changed it to water gas myself.

Q. Will you give me the name of any management in the United States of any company which is now getting prices for coke equal to the prices of anthracite coal in that place?

A. Why, I am not posted in regard to their exact relative prices now, but I know what has been and can be done where a coke market is worked up.

Q. Don't you know that many cities in the West have been obliged to and do fix the price of coke substantially below anthracite in order to get rid of it at all?

A. No, I do not.

Q. You know that anthracite coal is not used in England to any considerable extent, do you not?

A. Well, they have very little of their Welsh anthracite to use.

Q. Is it not true that in England until the introduction of water gas, coke was piled up in nearly every coal-gas plant in Great 4752 Britain because they could not obtain any market for it at all at a decent price?

A. The market of coke for domestic use in England I always understood to be a good one. Coke piles up at times in a gas works from the enormous production of gas, but it is worked off at other times.

Q. Did you not know and do you not know it to be a fact that until the introduction of water gas in Great Britain, which consumed coke in its operations, coke was a drug on the market and substantially every large coal-gas plant in Great Britain had great piles of coke undisposed of?

A. They may have charged too high, but——

Q. Don't you know that to be a fact?

A. No, I do not, and I do not believe it is, either. I know that that may be the pretence for the introduction of water gas, that that makes the only market for coke, but I have been over railways in England, north, south, east and west, and they used coke entirely for their locomotives and find it a good fuel.

Q. Where all works are coal-gas works, the amount used by locomotives would not consume the entire supply, would it?

A. Well, the amount used by locomotives where it is confined to coke will make a very great inroad into it, there is no doubt about that.

Q. Have you not known or heard of cases in the West where, on account of the prices they are able to get for coke, they more than offset the original cost of their gas coal, so that the material costs them really nothing?

A. I think there are such cases, without doubt, for coke, properly marketed, will bring a surprising price.

Q. You don't know of any such prices received in the East, do you, as $5.75 per ton for coke on the general market?

A. Not, but there ought to be.

4753 Q. Now you say that you find that the cost of gas to the Consolidated Gas Company of the gas manufactured under the agency agreement is less than 31.05c. Will you look at Exhibit 94 (handing book) and say what the cost is according to this of the gas made under agency agreements, the cost per thousand made? *A.* Is it not 34.04 cents?

A. Well, I——

Q. Well, is that right?

A. That is what that paper says, but——

Q. That is Exhibit 94, is it not?

A. Yes, but there are a great many things in Exhibit 94 that do not hold water.

Q. That may be, but is not that so in Exhibit 94?

A. It is so stated, but I——

Q. Wait a minute. Answer my question.

Mr. Page: He wants an answer to his question.

The Witness: That is stated there, yes, sir.

Q. Have you information that the Consolidated Gas Company did not actually pay 34.04 cents per thousand for the gas which they received? Have you any information to the contrary?

A. I have a——

Q. Have you any information to the contrary, that is the question?

A. I have not directly, but I have the information that that included 10 per cent. profit which they got back.

Q. Well, you thought they got that back, did you?

A. I understand so.

Q. And you do not think that the company is getting gas cheap if it gets it at fair cost of labor and material plus about three cents more, do you?

A. I think it is getting it very cheap, but——

Q. Well, that is all I have to ask on that point. Now I am going to see if I understand your theory of depreciation correctly, and I have tried to state it as I understand it. Is this right, that, 4754 in spite of the plant being kept in the best possible physical condition by current repairs, there is in your opinion a depreciation of asset value constantly accruing which is in direct proportion to the ultimate working life of the part of the plant in question?

A. I don't remember stating it in that way——

Q. Well, is that right in substance?

A. Well, I do not get your idea.

Mr. MATHEWSON: Please read the question again. I think perhaps it is clear.

Question read.

The WITNESS: Do you want an answer to that without any explanation.

Q. Yes, in the first place, if that is your understanding.

A. No.

Q. That is not your understanding or theory?

A. No.

Q. Just state what it is in a few words, without illustration, but briefly.

A. If you refer in this to the depreciation on the plant as I have assessed it, is that the idea?

Q. No, speaking of plants generally, is not your theory that, in spite of the expenditure for current repairs, there is a constant additional depreciation accruing in direct proportion to the ultimate life of the plant or apparatus which you have in mind?

A. Oh, well, that is clear enough; yes, there is a depreciation going on.

Q. And this would be in addition to the cost of any repairs currently made on the plant and should be charged each year to operating cost?

A. No, not to operating cost, by a long chalk.

Q. Why not, if it is depreciation?

A. It is not a part of the operating expense and not so charged.

Q. And do you mean to say that depreciation of a plant is 4755 not part of an operating charge to be made up from the sale of your product in order to maintain your plant?

A. That is true. It has to be made up from a sale of the product, but it is a fund; depreciation is not a vouchered account, and it is not money spent and has no business to be included in money spent. It should be set aside.

Q. We will waive the form of bookkeeping——

A. But that is very important.

Q. But the substance is that the amount of depreciation should be charged up or accounted for somewhere, and of course it must be taken into account in the sale of your product and covered by it so as to maintain your property?

A. Certainly, that is an axiom. I have no objection to that, only it is the way of carrying it on that I object to. It must be a fund, and not touched for anything.

Mr. **Mathewson**: That is all.

Mr. **Page**: I have sent for the book on the Boston investigation. I want to ask just one or two questions.

By Mr. **Page**:

Q. Have you examined that record of the Boston investigation, the investigation of the Boston Gas companies, with relation to the prices shown there to be received for coke in Boston?

A. I looked it over, yes, sir; I did not read the whole; that part relating to coke I noticed.

Q. Did you notice that one of those companies received $6 a ton for coke?

A. I think it was something over $6.

Q. And paid a trifle over $5 a ton for anthracite?

A. I think that is about the way it would figure. Anthracite is cheap there; we pay about that figure along the Sound, inland.

Q. And that the other company received $4 for its coke, 4756 being the two companies that were reported on. (Book produced.) I can give you the exact figures now, I think. That the Boston Gas Light Company received $4 a ton for coke and buys anthracite coal at $5.10.

Mr. **Mathewson**: Give me the page of that volume; what is it, if you do not mind?

Mr. **Page**: This is the hearing before the Board of Gas and Electric Light Commissioners, published in 1905 of the Investigation of 1904.

Q. And that the Bay State Gas Company charged $6.23 a ton for coke and bought their anthracite coal for $5.09. That is at page 235.

A. Yes, I noticed that statement.

Q. That is, it is put in as the price paid for coke used in generators, is that right?

A. That is right.

Q. Also the coke used in boilers?

A. Yes.

By Mr. **Mathewson**:

Q. Referring to these Boston gas companies you have never had the management of any company in Boston, have you?

A. No.

Q. You don't know anything about the circumstances under which this coke was obtained, do you?

A. I don't, only as stated there.

Q. Let us take the Boston Gaslight Company; it appears that the

the coal used in generators cost $5.10 per ton on page 273, does it not?

A. Yes.

Q. And it appears that coke used in generators, coke used in retorts and coke used in boilers is down at only $4 per ton, that is correct, is it not?

A. I did not notice that.

Q. Boston Gaslight Company, is that all coke that is referred to in this statement?

A. Yes.

Q. (Handing book.) $4?

A. Yes.

4757 Q. Don't you know that the Boston Gaslight Company produces that coke itself and does not buy it in the market and that this $4 a ton is merely a charge upon the Company's own books for its use of coke which it itself produces in the same station?

A. Yes, but it is incumbent to charge coke at the market price.

Q. No matter what it is incumbent to do, because you don't know what was done. But I ask you if that is not the fact which I have just stated in the previous question?

A. I know a coal gas company does not have to buy coke if it produces it.

Q. And it has a water gas plant attached to that?

A. Yes.

Q. So that this is not an actual purchase, but merely a book transaction in the books of the company as you understand it?

A. Yes, but it——

Q. Yes. Won't you just answer my question and stop?

A. Yes.

Q. Now we find, taking the Bay State Gas Company, that there was coal used in generators, 13,335 tons at $5.09 per ton. Now was not the amount of coke used in generators only 42 tons at $6.23 (handing book)?

A. Yes.

Q. And all the other coke that you find there is coke used in boilers, 17.8 tons at $6.23, is not that all the coke that appears in the statement?

A. All I noticed.

Q. Don't you know as a matter of fact that coke was obtained from the Boston Gas Light Company's Commercial Point plant at the time of the coal strike, when everything was out of sight in the way of fuel?

A. It is very possible, I don't know.

4758 Q. And don't you know that that includes the cost of placing upon the charges at the Commercial Point Works, the transportation across to the Bay State Gas Works and the unloading at the Bay State Gas Works and transportation to the generators, as well as the actual price which the Boston Gas Light Company received for the coke?

A. I suppose it included all expenses of getting it to generators.

Q. And don't you know that?

Mr. Page: The question is do you know of these facts in regard to that particular coke?

The Witness: No, I do not. I just take it for granted that the price of the coke there is delivered to the generator.

Q. Now, don't you know that the Bay State Gas Company produces no coal gas whatever but only water gas, and did at that time?

A. The Bay State is such a mixed affair, I guess nobody knows exactly what it does.

Q. Well, you don't know do you?

A. No, nor nobody else.

Q. I am referring, of course, to the Bay State Gas Company of Boston?

A. Yes, well, it is a very mixed situation.

Q. Is not your information that the Bay State Gas Company produce no coal gas but only water gas?

A. They produce water gas, I know that, but what it is doing now, it is producing water gas and stocks.

By Mr. Page:

Q. In regard to the price that the Boston Gas Light Company charged, you do not think that the Company charged itself a higher price for coke than the market price at which it was selling to its consumers, do you?

Mr. Mathewson: I object. That is too speculative.

Mr. Page: It is right on the line of your questions and it
4759 is directly responsive and in the same manner.

Mr. Mathewson: No, I asked him did he not know those things.

Q. I will say, don't you know, that the gas company does not charge itself more for coke than it charges its consumers.

Mr. Mathewson: I will ask that the question be limited to that particular case.

The Master: I do not see the value of that. He may ask him if he knows what the consumers pay. The other is a mere matter of opinion and argument. He does not know anything about what the gas company might charge. The fact is entirely competent, I agree with you Senator, about that, but I do not think that his opinion about it is of importance.

Q. Then we will turn over to page 274 and find where it states there the amount of coke produced to-day by the Boston Gas Company and at what rate?

A. Coke produced is 18,338.4 tons, at $4 charged.

Mr. Page: If the Master please, I shall want to examine Mr. Edgerton later on the 42d Street plant, and somewhat on candle power and pressure, and possibly upon the theory of distribution.

Mr. Mathewson: I thought he had finished his testimony on pressure.

Mr. Page: What is that?

Mr. Mathewson: And I cross-examined him on that, on the statement that that was all over. Mr. Edgerton testified respecting pressure and I was requested to cross-examine on the theory that that examination had been concluded.

4760 Mr. PAGE: As to pressure?

Mr. MATHEWSON: Yes, he had made tests of pressure in one place and another, and candle power.

Mr. PAGE: Not on that. It is on the relation of candle power and pressure, not on pressure. That particular subject has been exhausted, I take it. It is not to go into that same question again.

The MASTER: You want to suspend his examination and take up another witness, is that the idea?

Mr. PAGE: Yes, I have a witness who will take only a few minutes and then I understand Mr. Burr will have his witness here this afternoon.

MARVYN SCUDDER, called as a witness in behalf of the defendant, the State of New York, being first duly sworn, testified as follows:

Direct-examination by Mr. PAGE:

Q. What is your occupation?

A. My occupation is reporting on stocks and bonds; knowing about quotations, sale price, bid price, asked price; and to enable me to be able to refresh my memory and be better equipped for doing that work, I have collected a financial library which I began some five or six years ago, and which dates back to 1885, containing quotations that appear in the financial papers through- the United States, records of auction sales, brokers' sheets, giving offers and bid prices and other information of that nature, pertaining to sales of securities both listed and unlisted.

4761 Q. You have what might be called an information bureau in regard to stocks and securities?

A. On financial subjects.

Q. On financial subjects?

A. Yes.

Q. Where is your office located?

A. Located at 52 Wall Street.

Q. Under what name is your business conducted??

A. The Investors' Agency.

Q. Is that an incorporated Company?

A. Incorporated.

Q. Have you made an examination of the financial records with particular relation to the sales of stocks of gas companies in the United States?

A. I made such examination.

Q. As to the dividends paid per annum on the stocks and the selling price of the stock?

A. Yes, sir.

Q. And what that netted to the investor on his investment?

A. Yes, sir.

Q. You may state such companies as you have.

A. Peoples Gas Light & Coke Company of Chicago; dividend rate per annum 6 per cent., as of December 31st, 1905; price of stock 100¾; net to the investor at that price 5.98 per cent.

Mr. MATHEWSON: 5.98 and something over, was it not? What was the per cent.?

The WITNESS: I have only carried it out to two decimal places in each case; 5.98.

United Gas Improvement Company of Philadelphia, 8 per cent., 188½; 4.38 per cent.

Consumers' Gas Company of Toronto, 10 per cent., 207; 4.85 per cent.

Detroit City Gas Company, Detroit, 5 per cent., 200; 2.50 per cent.

Laclede Gas Company, St. Louis, Missouri, common stock, 5 per cent.; asked price, 105; no bid; 4.76 per cent.

4762 Lowell, Massachusetts, Gas Company, Lowell, Massachusetts, 10 per cent., 245; 4.08 per cent.

Consolidated Gas Company of New York, 8 per cent., 181; 4.42 per cent. That gives the comparative figures.

Q. Now, the Consolidated Gas Company, can you give the average price by years per share and the dividends paid?

A. Yes, sir. The average for the year 1901 was 213.48; it would be a little more than that, I might say, but I have only carried it to the two decimal places.

Q. Well, it is 213.48 plus?

A. Yes. Average for 1902, 221.45 per share; average for year 1903, 194.19 per share; average for year 1904, 204.40 per share; average for year 1905, 195.77 per share.

Q. Can you give the dividends?

A. I would have to refer to the Manual of Statistics which I have here to refresh my mind as to the dividends.

Mr. MATHEWSON: That is already in evidence. We can figure that out.

Q. Yes, you need not take any time on that.

A. I might say in case a question might arise upon the dividends for the year ending December 31, 1905, I am taking the rate of the Consolidated as of that date. It is 8 per cent. Of course, I thought the question might arise as to whether that was the total amount paid during that year. Of course, as I say, this is the rate.

Q. That is, there were two quarterly dividends of 2½ per cent. One the latter end of 1904 and one in the early part of 1905, that raise the dividend for the year?

A. Yes.

Cross-examination by Mr. MATHEWSON:

Q. You are the owner of this Investors' Agency?

A. I am part owner of it.

4763 Q. Stockholder?

A. Stockholder, yes, sir.

Q. What is your age?

A. Twenty-one.

Q. Then I judge that this information back to 1885 was not obtained by you from your own accumulation, but from a library which you have examined so far as the previous years are concerned?

A. Part if it was, yes, sir.

Q. And you have no objection if we desire it, to showing us the records from which you get the information?

A. No, sir, I am prepared to do that.

Q. Now, as a matter of fact, the last ten years has been a period of high prices in stocks, a great part of it, has it not?

A. Yes, sir.

Q. Usually high prices and in a very large number of stocks, of record high prices, has it not been, so far as your knowledge goes?

A. So far as my knowledge goes, I would say within the last ten years the prices have been pretty high.

Q. And for the last two years and at the present time prices are very high as compared with quotations of many years ago, are they not, stock exchange securities in general?

A. As compared with——

Q. Years ago?

A. Yes, sir, I should say so. They vary with different men in different cases.

Q. Will you tell me what the quotations for the Consolidated Gas stock is now at this period of high prices?

A. I am not prepared to give the figure on that.

Q. Is it not about 138?

A. Somewhere in that neighborhood. I have forgotten the exact figures.

Q. Has it not been your experience that the quotations of stocks of corporations in Wall Street depend upon many things besides the actual rate of dividend paid?

A. No question about that.

4764 Q. Is it not true that a stock which is paying 8 per cent. and is laying up large surpluses right along will sell at a very much higher rate than a stock which is paying 8 per cent. and barely earning it?

A. Not necessarily. There might be other——

Q. There might be other features?

A. Yes.

Q. But other things being equal, it would be so, would it not, according to your experience?

A. It would be likely to be so. I think——

Q. And you have made these computations simply to show the dividend which was paid in each case, have you not?

A. No, sir, I have made these computations with the idea of giving what large gas stocks sell for, giving the figures on that.

Q. And giving the basis of their dividends?

A. I have included that in the computation.

Q. And you have not shown the present or net earnings on the selling price of the stock, but only dividends paid?

A. I did not take that feature up in this particular matter here.

Q. The Pennsylvania Railroad is a public service corporation and is considered high class and rather a standard corporation?

A. By some people, yes.

Q. Is it not generally by the public?

A. As a stock investment?

Q. Well, I mean as a corporation, as a good type of public service corporation in management and standing?

A. Well I would not say that without a qualification, no, sir.

Q. You are not in the investing business but are in the statistical business?

A. I am in the statistical business, yes, sir. I make records in regard to investments.

Q. And does not your record show that while the Consolidated Gas stock sold for 241½ in 1897 and 241½ I think in 1887, it sold between those dates as low at 92½?

A. I would have to consult my records to answer.

4765 Q. Have you the record here for the sales of 1892 and 1893?

A. I have not, unless I go to——

Q. You know it has fluctuated very largely and has shown a fluctuation of more than 100 points, don't you?

A. Yes—excuse me before I answer that question. Did you say 1897?

Q. Yes, I referred to 1897 and 1884 for the 24½.

A. I have not those records here.

Q. And then I referred to 1892 and 1893 as selling at say 92½, but your answer perhaps is sufficient. That fluctuation in the price of the Consolidated Gas Company stock in the last fifteen or twenty years have shown more than 100 points?

A. I am not prepared to swear to that.

Q. Would not that be so from your recollection?

A. I should say that was so, but I am not prepared to swear to that absolutely, because I have not looked it up in this particular case, and I want to be very sure about my figures before I swear to them.

Redirect examination by Mr. Page:

Q. You know that the Consolidated Gas Company to-day is on a dividend basis of 4 per cent.?

A. The Consolidated Gas Company to-day?

Q. Yes, is paying a dividend of 4 per cent. to-day instead of 8 per cent. as it did formerly.

A. Well, to-day, yes, sir, but [illegible] is of——

Q. So if the quotation is as Mr. Mathewson says it is, and I have no doubt it is a fact, 138, it does not net on that price 4 per cent. to the investors?

A. No. That is of to-day. This is a computation for December 31st, 1905.

By Mr. Mathewson:

4766 Q. And you know also that the Consolidated Gas Company, speaking of it as a gas company, has a considerable part of its capital invested in securities of electric companies and their prospects come into the quotations of the Consolidated stock, do they not? What is your information in regard to that?

A. I know about that. The New York Edison Company——

Q. You know that, do you?

A. I realize that a good part of their assets are in stocks of other companies.

Mr. MATHEWSON: That is all.

Recess until 2.15 P. M.

After Recess.

WILLIAM D. MARKS recalled on behalf of the City.

Direct examination by Mr. BURR:

Q. When you ended your testimony a day or so ago, you were to have prepared a table showing the duplication or the triplication of the mains in the streets of the city, so far as your examination of the maps had gone. Have you done so?

A. I have.

Q. Will you state in what way you have prepared the statements which you have before you, and what they represent?

A. On the Island of Manhattan there are 6,000 street blocks; that is to say, 3,000 building blocks. Of these blocks 3,353 are occupied by one main; 56 per cent. of the total.

By two mains, 1,815 blocks are occupied; 30.2 per cent of the total.

By three mains, 548 blocks, 9.1 per cent. of the total.

By four mains, 235 blocks; 3.9 per cent. of the total.

4767 By five mains, 47 blocks ¾ of one per cent. of the total.

By six mains, two blocks, no percentage figured.

Total, 6,000 blocks and 100 per cent. checked.

The details are attached on eighteen sheets giving the location of each and every block and reference to the map and to the volume.

Q. How long has it taken you to prepare this?

A. Since leaving the witness chair, three to six of my assistants have been working in relays day and night without cessation up to an hour ago.

Q. Now, I think you have already been asked a question, during the progress of this trial as to whether in your opinion this was proper of economical construction, so far as the mains were concerned?

Mr. MATHEWSON: He has been asked and he has given his estimate of what a system would cost of single mains. He has been all over that.

Q. I say you have already expressed your views upon that subject.

A. I have.

Q. And your views, after an examination of these maps remain the same as to whether it is economical or uneconomical?

A. They remain substantially the same.

Q. And that is?

A. That is, that if it were necessary to substitute a system of mains involving one main or two mains according to the necessities of the case they could be installed at a less cost and with a great advantage to the Company and the consumers.

Mr. Burr: I will not take the time to read or have the Doctor read each street.

4768 Mr. Mathewson: If you want to offer it, why not offer this part of it and have the other sheets as you did before marked for identification so counsel can have access to them, if they desire?

Mr. Burr: Very good. I came prepared to have the Doctor identify each block in every street in the city from these papers, but I think the simpler way will be to offer in evidence, as I do, the sheet Page 1-A, containing table showing the sizes of the Consolidated Gas Company's mains in the streets of New York City as the Doctor has described them, and the other sheets, being eighteen in number, I ask to have marked for identification.

Mr. Mathewson: I make the same objection to this that I did to the other, that the map from which this is prepared is not original evidence and that it is not material or relevant evidence in any case, this being the property as it exists.

Objection overuled. Exception.

The first sheet is received in evidence and marked City's Exhibit 102.

The remaining sheets are marked for identification, respectively, City's Exhibits, 103, 104, 105, 106, 107, 108, 109, 110, 111, 112, 113, 114, 115, 116, 117, 118, 119, 120.

Q. Calling your attention to the testimony given by you on page 4607 and 4608 in response to a question of Mr. Mathewson as to the depreciation which you claimed amounted to $744,687 in the 14th Street plant, you were asked this question by him:

"Q. And depreciation is a charge to operating account in that the Company must maintain its property or should maintain its property, is it not? A. Yes, of .85 of one per cent. each year?"

4769 Will you be good enough to explain that a little more in detail as to what you mean?

A. The .85 of one per cent. annually allowed for depreciation was obtained from a resolution of the Board of Directors of the Consolidated Gas Company, dated January 30th, 1906, referring to the year 1905.

By Mr. Mathewson:

Q. You do not mean annually, do you, Doctor?

A. .85 of one per cent. annually. This .85 of one per cent. resulted from the assumption that $2.00 per annual thousand of sales was the proper investment, and that 1.71 cents per thousand of sales should be allowed for depreciation. This depreciation being due not to decay or wear and tear, but due to inadequacy of obsolescence. This .85 of one per cent. annually is to be charged to the cost of making gas, but it is also to be credited to the capital account or assets, reducing them by that amount. Taking .85 of one per cent. for fifty years it amounts to 42½ per cent. The question whether or no this percentage has been charged off on the books of the Company during the fifteen preceding years——

By Mr. Burr:

Q. Preceding 1905?

A. Preceding 1905; (continuing) is one which I cannot determine, having had access to the operating accounts only for the year 1905.

Q. You were asked this question further by Mr. Mathewson:

"Q. But a company is entitled to take care of its depreciation by a charge to operating expenses as it currently occurs, isn't it? A. Certainly, to the extent of .85 of one per cent.

4770 "Q. Well, whatever it is in any particular case? A. Yes.

"Q. And whether that depreciation occurs from one or the other causes to which you have referred? A. Yes."

Does that clearly express your views on that subject or do you desire to add anything further?

A. That precisely expresses my views although I may not have made myself as lucid as I could have. I think, however, my previous explanation will cover that ground.

Q. What have you to say to the allowance claimed by Mr. Addicks as to a contingent fund of ten cents in this connection?

A. Referring to the ten cents per thousand cubic feet of sales, except in so far as 1.71 cents for 1905 is concerned, it appears to me unjustifiable.

Q. Why?

A. Because it is excessive and not required; 1.71 cents per annual thousand cubic feet of sales being the result of the action of the Board of Directors of the Consolidated Gas Company for the year 1905.

Mr. Burr: I think that is all I want to ask the Doctor.

Cross-examination by Mr. Mathewson:

Q. This tabulation, City's Exhibit 102, is by blocks only?

A. Yes, sir.

Q. And not by mileage, either as obtained by you from the measurements of the map or from Mr. Simpson's testimony?

A. It is not by mileage.

Q. Now, it appears, does it not, that between 86 and 87 per cent. of the blocks have only one main or two mains?

A. About 86 per cent.

Q. 86.3 per cent. according to your figures?

4771 A. Yes; 86.3 per cent. of the blocks are occupied by one or two mains.

Q. And is it not true that in the cases where there are the greatest number of mains those cases are as a rule on the avenues, or Broadway?

A. Yes.

Q. And did you make any distinction as between the mains upon which services are carried and mains which are known as supply mains upon which there are no services but which are to conduct gas to a distant point before entering the mains on which services are located?

A. Not in City's Exhibit 102.

Q. You used the term "booster" system?
A. Never.

By Mr. Burr:

Q. Where does that information appear that Mr. Mathewson has asked for regarding the subject of mains?

Mr. Mathewson: I did not ask for any information. I merely asked if there was any distinction made in this mileage. He presented it.

Q. Is there any distinction made in the other exhibits already introduced?

A. In the three hundred and ten abstracts from the maps that is clearly shown.

Robert L. Waters, a witness called on behalf of the City, being first duly sworn, testified as follows:

Direct examination by Mr. Burr:

Q. What is your business or profession?
A. City surveyor.
Q. How long have you been a city surveyor in this city?
A. Upwards of thirty years.
4772 Q. Are you familiar with the city maps of all kinds?
A. Yes, sir.

Q. Will you look at the chart or diagram I show you and state what that is, if you know?

A. It is a map showing all the streets lying from between 12th and 16th Streets, both inclusive, and from Tompkins Street to Avenue A, showing also the lines of the high water and low water.

Q. It is a correct transcript, is it, of the City's Exhibit 76, the original map?

A. It is a correct copy of the original map. I don't know what the number of the exhibit is.

Q. Well, the original map we offered and it was numbered City's Exhibit 76. You made this copy from the map on file in what office?

A. The office of Public Works.

Q. That is a map containing the statement which appears upon this copy, is it, to which you referred?
A. Yes, sir.

Q. And that is a correct transcript of the statement appearing upon the original map?
A. It is.
Q. The copy was made by you?
A. Personally.

Q. And this is a true, a correct and an accurate copy of the map referred to insofar as the same refers to the locations described upon this map or included in this map or diagram?
A. It is.

Mr. Burr: I offer it in evidence.

Mr. Mathewson: Just what does this show anyway?

Q. This is a tracing from the map offered in evidence here marked City's Exhibit 76?

A. Well, this map is not taken direct from a tracing of the official map; that tracing has to be taken in pencil. We are not allowed to use inks.

Q. And this is taken from the pencil tracing?

A. This is taken from the pencil tracing.

4773 By Mr. **Mathewson**:

Q. And this interior tracing, irregular, in blue ink, is the tracing from that map, Exhibit 76?

A. Yes, sir.

Q. How about the balance of the map here?

A. What is shown on this map is all taken from the official map.

By Mr. **Burr**:

Q. And this map is over twenty years old, is it?

A. Yes.

Q. That is, it has been on file in that department for over twenty years?

A. Yes, sir.

Tracing marked "Tracing of City's Exhibit 76."

By Mr. **Mathewson**:

Q. Were all these lines on the original map?

A. Yes, and on the same scale, yes, sir.

By Mr. **Burr**:

Q. Describe what the paper is which I now hand you.

A. This is a tracing of the map showing all the streets, including 40th Street up to 46th Street inclusive, lying between Tenth Avenue and Thirteenth Avenue, both inclusive, showing the high and low water lines; also grant of land to John J. V. Westervelt; and also a pier and bulkhead with the distances on the grants; also the block distances on the streets and on one side of Tenth Avenue and one side of Twelfth Avenue, and also showing the depth of water below high water on the line of the Hudson River.

Q. And is this tracing of the original map made in the way you have described the other, Exhibit 76?

A. Yes.

4774 Q. Have you correctly and accurately placed upon this tracing the endorsement which appears on the original map heretofore offered but not marked in evidence City's Exhibit 78?

A. I have.

Q. And is that tracing a true and accurate tracing of such original map?

A. It is.

Q. Is that map over twenty years old to your knowledge?

A. Yes, sir.

Q. Has it been on file in the Department of Public Works for a longer period than twenty years?

A. Yes, sir.

Mr. Burr: I offer in evidence that tracing as being a correct tracing of maps heretofore offered, "A map showing the projected exterior line of the City of New York, extending along the Hudson River from Hammond Street to 135th Street, signed New York, March 10, 1837, George B. Smith, City Surveyor," and special reference being made to that part of the map which lies between 40th and 46th Street, west of Eleventh Avenue.

Paper marked tracing of City's Exhibit 78.

Mr. Burr: As to the prior tracing, City's Exhibit 76, it is received in evidence, I understand, as a correct copy of the original map offered but not marked in evidence heretofore, bearing the endorsement, "East River Shore, Corlaer's Hook to 28th Street, March 7, 1825," and it bears the endorsement on the front of it, "In Common Council, March 7th, 1825. Upon the report of the Finance Committee on Recommendation of Peter G. Stuyvesant, this map was presented and was accepted and approved by the Board. Peter J. Martin, Clerk," the map being of Tompkins Street, special reference being made to that portion of the map which shows
4775 Tompkins Street between 12th and 16th Street.

Q. (Handing paper.) What does this show?

A. 109th Street, 110th Street, 111th Street and 112th Street, First Avenue and Avenue A, and a portion of another street lying easterly of Avenue A which is supposed to be an exterior street, but there is no name on this portion of the map. It also shows First Avenue and part of Avenue A.

Mr. Mathewson: What is the date?

The Witness: 1858.

Q. Was that copy made by you or that tracing made by you?

A. Yes, sir.

Q. Does that contain a true and correct copy of the endorsements appearing upon the original map?

A. It does.

Mr. Burr: I offer it in evidence, being an extract from map heretofore offered in evidence, but not marked, City's Exhibit 80.

Paper marked "Tracing of City's Exhibit 80."

Mr. Burr: I offer this as a copy of the resolution approving the Southard map, being the map just introduced as City's Exhibit 80.

Paper marked City's Exhibit 80-A, (the same to be appended to City's Exhibit 80.)

Mr. Burr: I offer in evidence copy of the grant, City, Exhibit 81, appearing on page 4285 of the testimony.

Paper marked copy of City's Exhibit 81.

Q. (Handing paper.) What paper is that which I hand you now, please describe it and tell us what you know about it?

A. Map showing all the streets from 14th to 18th Streets,
4776 both inclusive, from Tompkins Street to Avenue B, inclusive; also showing the grant of land to Hezekiah Bradford, dated 22d day of June, 1848.

Mr. Mathewson: That was part of the deed, wasn't it.

Mr. Burr: Yes.

Mr. Mathewson: The witness simply says that he made this tracing, does he?

Mr. Burr: Yes.

Mr. Mathewson: The witness does not know whether they were attached to the maps or not?

Mr. Burr: The witness does not identify those but identifies the maps as correct tracings.

Mr. Mathewson: In each case the grant was offered in evidence including the maps, so it is a mere matter of having a copy offered instead of the original.

Mr. Burr: And having the grants spread upon the record.

Mr. Mathewson: Supposing you offer them one at a time and then ask Mr. Waters if he made accurate copies of the maps attached to the original grant. That will satisfy me.

Mr. Burr: Then I ask to have copy of City's Exhibit 82 marked, with the map accompanying the same, also City's Exhibit 83 and the map accompanying the same; also City's Exhibit 84 and the map accompanying the same same; also City's Exhibit 85 and the map accompanying the same; also City's Exhibit 86 and the map accompanying the same.

Papers received and marked copies of City's Exhibits 82, 83, 84, 85 and 86.

Q. (Handing paper.) I hand you City's Exhibit 88 for identification in this case. Will you say whether that diagram was
4777 made by you?

A. It was.

Q. What does it represent?

A. It shows 14th, 15th and 16th Streets, Avenue C and Avenue D and Tompkins Street, one side of Tompkins Street.

Q. And that is an extract from what map?

A. It is also—the red lines upon that map are the lines taken from the water grant map of that section; the black lines lying East of the red lines are taken from Complainant's Exhibit 48, page 2.

Q. What does this red line represent?

A. It represents the line of Tompkins Street.

Q. Does it show what that line cuts off?

A. Yes, sir, on the block line between 15th and 16th Streets, Avenues C and D.

By Mr. Mathewson:

Q. The line of Tompkins Street according to what survey?

By Mr. Burr:

Q. From what map was this tracing made?

A. The water grant map.

Mr. Mathewson: You mean the red lines?

The Witness: Yes.

Q. That is the map you have identified to-day and which had been offered in evidence as City's Exhibit 81?

A. Yes, sir.

Mr. Burr: I offer that in evidence. I merely had that made for convenience so that when testifying to the altered valuation, Mr. McHale and Mr. Thompson, might use it, but Mr. Walters now produces the correct tracing from the original map, and this he testified is correct.

Paper marked City's Exhibit 88.

4778 Mr. **Burr**: We expect to have blue prints ready for you to-morrow, Mr. Waters states. You can have those in the meantime for any purpose you desire.

Mr. **Mathewson**: I do not know that I will want them in the meantime, but I will want to use a blue print within the next few days, that is all.

Cross-examination by Mr. **Mathewson**:

Q. Have you compared each one of the maps here with the original and made it from the original to which it related in each case?

A. I made each one personally.

Q. And they are accurate copies of the maps?

A. They are, yes, sir.

Mr. **Mathewson**: Now, Mr. Master, I have not objected to the marking of these copies because the original maps came in in order to show water grants, but I do want to place upon the record that if they are introduced for the purpose of showing a want of title of the Company to its property, which it is now using, I object to it as immaterial and irrelev*ena*t and not in issue in this case. I assume the Master does not propose to try an ejectment suit here. It is a question of the valuation of the property. I make the statement so that my position may not be misunderstood at any moment.

Mr. **Burr**: I do not suppose you claim a return upon any property that you are not legally entitled to.

Mr. **Mathewson**: We claim a return upon the property and investment and resources which are in the gas business.

The **Master**: I suppose I shall have to assume that any 4779 property of which the Gas Company is in possession and is using and occupying, they have the right to use and occupy either by one form of title or another, unless I have actual notice to the contrary.

Mr. **Mathewson**: And may I ask counsel how, if we were to be excluded from land at one point or another, upon which our plant is now placed, it would be possible to avoid crediting us with an equal amount of land that we would have to get somewhere else and put up a plant of producing that capacity?

Mr. **Burr**: The situation is this, in a nutshell, you have already admitted that the title was originally in the city, and it remains for you to prove that you received it from the city, or any of your grantors received it.

Mr. **Mathewson**: You missed my point. If we hold a block here which belongs to the city and it could be held that we could be rejected from that, we must have credit for land somewhere else, because we have to get land somewhere to manufacture our gas, and you could not get away from that proposition, if any of our manufacturing plants were on someone else's land.

Mr. Burr: That is another matter. These maps show the situation as it is to-day.

Q. Now, Mr. Waters, referring to City's Exhibit 76, it is in evidence that the manufacturing plants of the Consolidated Gas Company are upon the blocks 14th to 15th Streets. You have seen the plants there, haven't you?

A. I have been in that section.

Q. And the Manhattan Company was incorporated, if I recollect about 1830 or such a matter. How long have you lived
4780 in New York City?

A. Well, in New York City for nearly sixty-five years. That is, what is Greater New York.

Q. You do not remember the time when there were not gas plants at 14th and 15th Streets?

Mr. Burr: Objected to as immaterial and incompetent. He cannot prove adverse possession by this witness. We simply called him to prove that these tracings are copies of the map.

The Master: I will let him answer.

Mr. Burr: Exception.

A. My earliest recollection places the plants down at about 111th Street.

Q. Yes, that is another plant, but do you remember any time when the Manhattan Gas Light Company, which was incorporated about 1830, did not have a manufacturing plant at 14th and 15th Streets?

Mr. Burr: Objected to because it is assuming something that the witness has not testified to.

The Master: He may know something about it.

By Mr. Burr:

Q. Do you know that this Company was incorporated in that year?

Mr. Mathewson: I will put it this way, if you object.

By Mr. Mathewson:

Q. It is in evidence that the Manhattan Gas Light Company was incorporated about 1830 and that one of its plants was located at 14th and 15th Streets and that it went into the Consolidated
4781 Gas Company in 1884. Do you remember any time when there was not a gas plant at 14th and 15th Streets?

Mr. Burr: I make the same objection to this question.

The Master: Same ruling.

Mr. Burr: Exception.

A. I cannot place the plant at 114th and 115th Streets.

Q. No, no, 14th to 15th Streets, not 114th to 115th Streets.

A. Oh, 14th and 15th Streets? No, I do not recall any time but what there was a plant there at 14th and 15th Streets.

Q. In your avocation as a surveyor you have been generally familiar with the City of New York and been over almost every section of it 30 or 40 years ago?

A. Pretty much.

Q. Generally, yes.

A. Yes.

Q. Did you make a survey of this property at 14th and 15th Streets now, Mr. Waters?

A. No, I did not.

Q. These maps that have been produced here today, both those affixed to the grants and the detached maps correctly show or purport to show the situation at the date of the map and not the present situation as to streets and property on the water front?

A. That is all.

Q. Do you know, taking City's Exhibit 78, whether Twelfth Avenue has actually been cut through below 46th Street, or whether it is laid out or is used at all by the public?

Mr. BURR: Objected to as incompetent, irrelevant and immaterial and this is not proper cross-examination, this witness not being called except for the purpose of identifying these exhibits as being true accurate extracts from the original maps offered in evidence.

4782 The MASTER: Well, Mr. Mathewson, can examine him if he chooses to take the risk of making him his witness, on these matters.

Mr. BURR: Exception.

A. What street did you say?

Q. Twelfth Avenue.

A. Between what streets?

Q. Do you know whether it is cut through below 46th Street at all?

A. If my memory serves me, I think not.

Q. Don't you remember a gas plant at 41st to 42nd Street and another from 44th to 46th Street, west of Eleventh Avenue, ever since you have been a city surveyor? Is it thirty years?

A. City Surveyor, yes. I remember there were gas plants in that vicinity, but I could not say the exact location.

Q. About that location?

A. Yes, there were gas plants there.

Q. I see that in City's Exhibit 80, Avenue A is indicated east of First Avenue. Exhibit 48 shows an avenue there known as Pleasant Avenue instead of Avenue A. Are those identical streets do you know?

A. Yes, sir, Avenue A was changed to Pleasant Avenue.

Q. And in 1857 there appears to be shown on this map a gas works on 111th Street?

A. There was a gas works there then.

Q. Referring to City's Exhibit 88, the red line, in order to identify it otherwise than by color is the easterly end of the block bounded by 14th and 15th Streets, Avenue C and Avenue D, is it not?

A. Yes, sir.

Q. And the diagonal line running northwest from near the northwesterly corner of Avenue D and 15th Street and coming out about one-third of the way from Avenue D to Avenue C on 16th Street?

A. Yes.

4783 Mr. Burr: To be accurate, this is a black and red line.

Q. And the irregular lines shown on these City's exhibits interior to the outside lines are in blue?

A. Yes, sir. There is one map that has black irregular lines on.

Q. Yes, I see that there are some of them that have black lines as well as blue.

A. Yes. Those are supposed to show the lines between the upland and the salt meadow, I should take it to be.

Q. The black lines are——

A. The black irregular lines.

Q. And the blue irregular lines?

A. Are the water lines from the original maps.

Q. High water mark?

A. I presume there would be originally a high water mark and original low water mark.

Q. And you did not make these original maps yourself?

A. No, sir.

Q. And you merely draw your conclusions?

A. Yes.

Mr. Mathewson: That is all.

Mr. Burr: I offer in evidence certified copy of deed dated November 18th, 1882, from Everett Peppenell Wheeler, and Lydia L., his wife, Mary Hannah Smith, and Reverend Cornelius B. Smith, her husband, and said Everett Peppenell Wheeler and Mary Hannah Smith, individually and heirs at law of David Everett Wheeler, to the Metropolitan Gas Light Company to the City of New York. I simply desire to read in the consideration expressed as follows:

"Witnesseth, that the said Everett Peppenell Wheeler, Mary Hannah Smith and Cornelius B. Smith, three of the parties of the 4784 first part, by virtue of the power and authority to them given in and by the said last Will and Testament, and for and in consideration of the sum of Eighteen thousand five hundred and sixty dollars, lawful money of the United States of America, to them in hand paid by the said party of the second part." Transferring the property described in the said deed. The deed is dated November 18th, 1882, and was received in the office and recorded November 29th, 1882, at 1 P. M., Samuel Taylor, Clerk.

This covers the Shadyside property, that is the upland. Attached to the deed is a certificate dated the 4th day of December, 1906, reading as follows:

State of New Jersey, *County of Bergen, ss:*

I, John R. Ramsey, Clerk of the County of Bergen in the State of New Jersey, and also Clerk of the Circuit and Common Pleas Courts, in and for said County (Courts of Record), do hereby certify that I have compared the copy of the record of the Deed hereto annexed, with the original record thereof in Liber H-11 of Deeds, at pages 44, &c., in my office at Hackensack, in said County, and that the same is a true copy thereof, and of the whole of such original record.

In Testimony Whereof, I have hereunto set my hand and affixed the seal of said Courts and County, at Hackensack aforesaid, this fourth day of December, one thousand nine hundred and six.

[SEAL.] JOHN R. RAMSEY, *C.*,
By W. S. DORUM, *D/C.*

Paper marked City's Exhibit 121.

4785 & 4786 Mr. Burr: I offer in evidence grant dated January 6, 1883, from the State of New Jersey to the Metropolitan Gaslight Company of the City of New York, conveying to the party of the second part, the Metropolitan Gaslight Company of the City of New York, the land under water and Shadyside. I read on the record the recital as to the consideration: "And, whereas, the said Commissioners, having due regard to the interests of navigation, have agreed to grant the lands hereinafter mentioned, and determine that $7,291.35 is a proper compensation to be paid to the State for the lands hereinafter conveyed."

The same being duly certified by J. R. Ramsey, Clerk of the County of Bergen, in the same manner as previous deeds, City's Exhibit 121.

Paper received in evidence and marked City's Exhibit 122.

Mr. Burr: That is all I can do to-day. I desire to say for Senator Page and Mr. Kirby that they will be ready to-morrow with some of their witnesses who are on their way here by train, and they are expecting their arrival hourly.

At 3:50 P. M. adjourned to December 8, 1906, at 10:30 A. M.

Last Exhibits:

Complainant's 257.
State's AAA.
City's 122.

4787 Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,

vs.

JULIUS M. MAYER, as Attorney General of the State of New York; WILLIAM TRAVERS JEROME, as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIAN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and THE CITY OF NEW YORK, Defendants.

Before Arthur H. Masten, Special Master.

NEW YORK, *December 8th,* 1906.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Page, Mr. Kirby.

4788 GUSTAVUS T. KIRBY, a witness called on behalf of the State, being first duly sworn, testified as follows:

Direct examination by Mr. PAGE:

Q. What is your business?

A. I am a lawyer, sir.

Q. Where is your place of business?

A. 2 Wall Street.

Q. Pursuant to the understanding that you were to receive a sample of the oil used by the Consolidated Gas Company, did you visit the works of the company?

A. I did; the 21st Street works of the company, Avenue A and 21st Street.

Q. On what date?

A. On Wednesday, December 5th.

Q. Whom did you meet there?

A. Dr. Elliott, the chemist of the Consolidated Gas Company.

Q. Now you may state what you did.

A. With him I went to the operating floor of the station and there, in the presence of Dr. Elliott and myself, about four quarts of oil were drawn from the pipe which entered into the enriching apparatus.

Q. Did that go into the low water gas generators? The oil is an enriching——

A. Into the low water gas generators.

Q. Then it was taken from the feed pipe?

A. From the feed pipe to that apparatus.

Q. What else did you do?

A. About two quarts of this oil was placed in a can which I retained, and the balance was retained by Dr. Elliott. We then went to the pump, which I was told by Dr. Elliott was taking the oil from the tank and forcing it through the pipes to the various apparatus,

and for us at this point about four quarts of oil were drawn. As in the other instance, two quarts were furnished to me, which I placed in a can, and the balance was retained by Dr. Elliott. The
4789 first can was marked by me, "Can A," and the second can was not marked at all. I then took these cans to my office at No. 2 Wall Street and there——

Q. One minute. Was it stated to you what gravity oil this was?

A. It was stated to me that this was the high gravity oil. I requested them to also furnish me oil of about 28-degree gravity, or such as they used at other times than at present. Dr. Elliott stated they had none in the yard at that time, and it would be impossible for him to furnish me any.

Q. When you said 28-degree oil such as they had used at other times, did you mean the 28-degree oil that was called for under the contract?

A. I so stated to Dr. Elliott. He informed me he had no knowledge of any contract or what was in it, but he did know what I meant when I said 28-degree oil, and he considered that as the oil which they were not using. The oil which he designated as 34-degree oil I took samples of.

By Mr. Mathewson:

Q. Who stated this was the high gravity oil?

A. Dr. Elliott. I also talked over the telephone with Mr. Bradley about the low gravity oil, and I talked with Mr. Bradley over the 'phone enough to recognize his voice when I hear it, and I know it was he who was speaking, and he stated to me that they could not furnish me any 28-degree oil at this time. That is, by "they" I mean the Consolidated Gas Company.

Q. Did he give any reason more than that they did not have it?

A. None, other than that they did not have it.

Q. Now you may state what you did with these samples of oil?

A. I brought them down to my office at No. 2 Wall Street, and there Mr. James Boyd, who is here present, wrapped them up.
4790 I wrote a letter to Mr. Lewis Emory, Junior, Bradford, Pennsylvania, and turned over the oil and the letter to Mr. Boyd, with instructions to him to deliver them to Mr. Emory at Bradford.

Cross-examination by Mr. Mathewson:

Q. Mr. Elliott told you that the reason he could not give you the lower gravity oil was because the company was not at present using it, didn't he?

A. And because they had none in their yard or anywhere that he knew.

Q. He told you the company was not in the present cold weather using it?

A. Yes, that at this time the company was not using the low gravity oil.

Q. And Mr. Mathewson, counsel for the company, also stated that to you before you went up to draw the samples, did he not?

A. I was not surprised when Dr. Elliott so stated, and was not surprised for the reason that Mr. Mathewson had stated as he has just said.

Q. Do you know who Mr. Emory, of Bradford, is?

A. I have heard of Mr. Emory, of Bradford, Pa., for some little while as a man prominent in matters having to do with oil, being an oil producer and vendor, being proprietor of a company that has a pipe line to Philadelphia.

Q. Well, the samples were given you as asked for and at the place designated, were they not?

A. They were, sir.

JAMES D. BOYD, a witness called on behalf of the State, being first duly sworn, testified as follows:

Cross-examination by Mr. Mathewson:

4791 Q. What is your occupation and where is your place of business?

A. My occupation is bookkeeper, at 2 Wall Street.

Q. Did you receive a sample of oil from the preceding witness, Mr. -irby?

A. I received two cans of oil from Mr. Kirby at his office, 2 Wall Street; one can marked "A," that is, marked on the cork, and the other was blank. I wrapped those two cans up in a package and took Mr. Kirby's instructions as to the delivery of them.

Q. Where did you go with them?

A. I took the Erie Railroad train to Bradford, Pennsylvania, at 7:30, I believe, at night. I took the cans in my possession and kept them there until I reached Bradford, Pennsylvania, next morning. I then inquired for Mr. Emory at Bradford and was told that his office was 41 Main Street. I went to 41 Main Street and was told there I might find Mr. Emory at the acid works in South Bradford. I took the cans and letter of Mr. Kirby to the acid works, saw Mr. Emory probably about 11:30 or 11 o'clock, or thereabouts, and he told me he would see me later at his office at half-past one, 41 Main Street. So I met that Mr. Emory and his son at his office, 41 Main Street, and opened the package in there, and they sent for Mr. Scott——

By Mr. MATHEWSON:

Q. Are the two gentlemen to whom you delivered those two samples of oil present here now?

A. Yes, sir.

Q. What were their names?

A. Mr. Lewis Emory, Jr., and I think Mr. Delavan Emory. I am not sure as to his name. It was Mr. Emory's son.

Q. In whose office are you a bookkeeper?

A. Gould & Wilke's office, 2 Wall Street.

4792 By Mr. PAGE:

Q. Did you deliver these packages in the same condition that they were in when you received them?

A. Yes. I wrapped them myself and I delivered and opened them myself.

Q. And they had not been opened from the time you got them until you delivered them?

A. No, sir.

By Mr. MATHEWSON:

Q. Were they stopped by cork in each case?

A. Yes, sir; I tied the corks in. And they were in exactly the same condition.

Q. Were the corks driven in originally or simply pressed in?

A. Simply pressed in, simply put in the stopper in the can.

DELAVAN EMORY, a witness called on behalf of the State, being first duly sworn, testified as follows:

Direct examination by Mr. PAGE:

Q. Where do you reside?

A. Bradford, Pennsylvania.

Q. What is your occupation?

A. Oil refiner.

Q. How long have you been engaged in that business?

A. Since July, 1891.

Q. And your works are at Bradford, Pennsylvania?

A. Yes, sir; I am manager of the works; the Emory Manufacturing Company is the name of the firm.

Q. What is your particular part of the business?

A. I am the manager.

4793 Q. Were you present at the time these two cans of oil were delivered by Mr. Boyd, the witness preceding you on the stand?

A. Yes, sir.

Q. Did you receive one of the cans?

A. Yes, sir. Both cans were opened there in the presence of my father and myself. We sent to the works for our superintendent and he brought the hydrometer jar, Beaumé hydrometer and thermometer to our office and we weighed or took the gravity of the oils contained in the two cans, one can marked "A" and the other can was blank; no mark at all.

Q. What did you find was the test of that oil?

A. 34 gravity; a fraction over 34.

Q. What else did you do with the oil?

A. We offered to make no other test except the odor, the smell of the oil.

Q. What did you discover by the odor?

A. It was not anything like any oil we made from Pennsylvania crude. I should judge it was an oil produced by what is the low grade crude oil; produced from a low grade crude oil.

Q. Could you tell by that means whether it was a Pennsylvania oil?

A. Yes, sir; I could tell by the odor it was not Pennsylvania oil.

Q. And when you speak of Pennsylvania oil what in the trade does that mean? What is supposed to be the Pennsylvania oil?

A. It is the oil that is produced in western New York, Pennsylvania, West Virginia and southeastern Ohio, and bears a price of $1.58 a barrel.

Q. That is the crude oil at the well?

A. Yes, sir.

Q. Those oils have a para-fine base, have they?

A. Yes, sir; they contain no sulphur.

Q. Well, will you produce, if you have it, a portion of the oil that was in the can "A"?

A. (No answer.)

Q. You made some tests of the other can, did you, the one without a mark?

A. Yes; they were both the same.

4794 (Witness now produces a bottle containing a fluid.)

Q. The sample you now produce is from can "A"?

A. Yes, sir; it is so marked on the cork.

Mr. **Page**: I offer the sample in evidence.

Mr. **Mathewson**: I have objected previously to this line of testimony as immaterial and irrelevant, and I think the Master decided to accept it. I make the same objection to this testimony now.

Objection overruled; exception.

Received in evidence and marked State's Exhibit BBB.

Q. Have you a sample of a similar grade oil taken from the Pennsylvania field?

A. Yes, sir. (Producing another sample.)

Q. What is the sample you now produce?

A. 34 gravity pressed distillate, used for fuel and gas oil.

Mr. **Page**: I offer this sample in evidence.

Received in evidence and marked State's Exhibit CCC.

Q. From what field would you judge from its appearance and smell the sample of oil, State's Exhibit BBB, came?

Mr. **Mathewson**: Is the witness shown to be competent to judge?

A. I could not state from what field, but I am positive it is not from Pennsylvania for the reason they do not sell 34 distillate for gas oil, the Standard Oil Company or any other people. That is wrong, I did not mean to say that.

Q. Well, just correct it. How do you want to correct it?

4795 A. I will have to explain the process a little bit. In the Bradford oil these neutrals are—in the lubricating trade the neutrals are sold by the test, and the neutral oil from our Bradford oil or a 34 from our Bradford crude lacks viscosity, or will not answer the trade requirement for lubricating oil of 34 gravity, and for that reason we sell it for fuel oil; but the Standard Oil Company, they have a trade in which they use all their Pennsylvania neutrals, I assume, for lubricating oil.

Q. Now, are you familiar with the oil that is produced and sold in large quantity for export, which is a 44 degree oil?

A. Yes, sir.

Q. Have you a sample of that?

A. (Producing sample.) It is an export oil, 45 degrees, according to the rules of the Produce Exchange; 44½ degree or better.

Q. Do you know at what price this oil is sold in the New York market?

A. It is sold for 4.4 cents per gallon f. o. b. tank steamer, New York Harbor.

Q. Can anybody buy this that wishes to do so in the market?

A. Yes, sir.

Q. Not alone for export, but buy it for any purpose at that price?

A. Yes, sir.

Q. At what price do you sell this oil in Philadelphia?

A. We sell it for $4.35, the regular official quotation, f. o. b. tank steamer in Philadelphia, or rather at Marcus Hook, eighteen miles below Philadelphia.

Mr. Page: I offer this sample in evidence.

Received in evidence and marked State's Exhibit DDD.

Q. Referring to State's Exhibit DDD, is that a refined oil?

A. It is what is known as a 73 Able standard white oil, refined.

4796 Q. Wherein does this differ from the 34 degree oil, State's Exhibit CCC?

A. This is a finished product and the other is a distillate.

Q. What do you mean by a finished product?

A. An oil that has gone through all the processes of refining and is ready for the lamp.

Q. Besides having had drawn off the distillate, it has been refined?

A. Yes, sir; been treated.

Q. That naturally adds to the cost of the oil?

A. Yes, sir.

Q. Have you the distillate from which this is refined?

Mr. Mathewson: From which this particular oil was refined that you offered?

Mr. Page: No, that character of oil——

(Witness produces another sample.)

Q. Is this part of the same?

A. This is further along in the process.

Q. It is the same oil?

A. It is the same product. From this we obtain the export oil (referring to bottle last produced).

Q. That is the same gravity?

A. All the properties are the same in this except the color.

Q. And this is the distillate oil of which Exhibit DDD is the refined oil?

A. Yes, sir.

Mr. Page: I offer this sample in evidence.
Received in evidence and marked State's Exhibit EEE.

Q. At what prices does State's Exhibit EEE sell in the New York market?

A. It is not sold in the New York market. At least, we do not sell it here.

Q. Where do you sell it? In Philadelphia?

A. We do not sell it as distillate. We sell it as 73 Able standard white oil.

4797 Q. Well, you only sell the refined product, then?

A. Yes, sir.

Q. How much does the refining add to the cost?

A. Probably one-sixteenth cent a gallon.

Q. And is there any 28-degree oil produced and sold for gas-making purposes from Pennsylvania oil?

A. No, sir.

Q. Why not?

A. 28-degree oil produced from Pennsylvania oil is sold as cylinder stock, a light gravity and low fire-test cylinder stock, and from the para-fine, 28-para-fine oil, which is sold for more money than is obtained for the gas oil.

Q. That is, the 28-degree Pennsylvania oil is more valuable than the 34-degree?

A. Yes, sir, for the reason that it is a lubricating oil.

Q. And brings a higher price in the market?

A. Yes, sir.

Q. But you know that there are gas oils of 28 degree Beaumé?

A. I never heard of it being that low, no, sir. We never had any inquiry for gas oil of that gravity.

Q. Well, you manufacture at your refinery Pennsylvania oil entirely?

A. Yes, sir.

Q. Do you at your refinery distill anything but the Pennsylvania oil?

A. Yes, sir. We have nothing but Pennsylvania oil. Yes, sir. That is all we refine, Pennsylvania oil.

Q. Do you know what is the base of the Texas and Indian Territory oil?

A. Asphalt.

Q. Are you familiar with the price of oil at the wells?

A. I know the Pennsylvania price.

Q. That is all you are familiar with?

A. Yes, sir.

Q. You might describe the process of distillation by which these different degrees oils are produced?

A. This oil is produced by placing the oil in——

Q. You refer to Exhibit EEE?

A. Yes.

4798 Q. That is the refined produce. I was asking for the distillation process. The oil comes from the well, and where is it put then?

A. Into stills, and fires lighted and the vapors arise from the oil and are condensed.

Q. Pass through a worm?

A. Pass through a worm and go into the various distillate tanks.

Q. What comes over first?

A. Benzine, the lightest product.

Q. Then what comes off next?

A. Then comes the heavy naptha, and then comes, we call it, the top cut of the export oil.

Q. That is as the temperature increases, the heavier oils are volatilized, is that it?

A. Yes, sir. Then after the first cut of this export oil comes the water white cut, which is about from 52 down to 41 gravity. Then after water white oil is off, steam is introduced into the bottom of the stills, and this 34 gravity oil is thrown off by steam. This oil is then cracked up again or granulated and it is then pumped through stilling machines. The cold distillate is then——

Q. What is that process for, to remove the para-fine?

A. To remove the para-fine, and it is put into filter presses and the para-fine extracted, and the oil that remains is this 34 distillate; that is one process and the other process where we get the tar, there is no steam introduced into the bottom of the still at all. The whole mass evaporates down to about 22 gravity.

Q. What is the most profitable oil?

Mr. MATHEWSON: I object to that.

Q. Or grade of oil?

Mr. MATHEWSON: I object to that as wholly immaterial and irrelevant.

4799 The MASTER: I do not see the materiality of it, but I suppose the Senator will connect it with something later. I will allow it.

Mr. MATHEWSON: Exception.

Q. (Question repeated as follows: "What is the most profitable oil or grade of oil?")

A. Benzine.

Q. What next?

A. Then comes the cylinder oil.

Q. That is lubricating oil?

A. Yes, lubricating oils.

Q. What degree is that?

A. They run about 24 to 28 gravity.

Q. Then what next?

A. Then the water white.

Q. What does that run from in gravity?

A. Water white in about 47 gravity.

Q. Then what next?

A. The wax oil.

Q. That is the para-fine?

A. No, sir; that is the neutral oil.

Q. Oh. the wax oil you say?

A. Yes, the wax oil.

Q. What degree is that?

A. 34 to 36 gravity.

Q. Then what?

A. Then the export oil, 73 Abel; Abel is the name of the cup in which tested.

Q. 73 degrees Fahrenheit?

The WITNESS: Yes, sir; 73 degrees Fahrenheit on the Abel cup; we call it 73 Abel oil.

Mr. MATHEWSON: What gravity is that?

A. 44½ gravity is the official gravity.

Q. What next?

A. Tar.

Q. That about exhausts the product, does it not?

A. Yes.

Q. When you say a 45 degree oil or a 34 degree oil, does that mean an oil entirely of that degree or could it be fractionated into different degrees?

A. It could be fractionated.

4800 Q. That is in this 44 degree oil, if you should fractionate it, you could obtain some higher degree?

A. Yes.

Q. Is there any oil until you get down to the tar, or even then I suppose, that cannot be fractionated into several different degrees of Beaume test?

A. After you get down to coke in the still.

Q. I thought that when we had reached tar, we had reached the end of the product?

A. You reach the end of the product in the crude stills. The tar is——

Q. What comes next?

A. The tar is run on specially constructed stills, heavier bottoms and heavier stills and through a different condensing process.

Q. Then what do you obtain by that?

A. The first distillate we obtain is what we call gas oil.

Q. Then what do you get?

A. Then we get an intermediate oil, para-fine oil and heavy para--fine oil—or distillate I mean, intermediate distillate and heavy distillate.

Q. What are those used for?

A. We extract wax from the para-fine distillate and after the wax has been extracted the oil is put into reducing stills and run to what ever gravity is required, either 24 degrees, 28 or 23 para-fine.

Q. What is that used for?

A. Lubrication.

Q. Then of all of the oil that comes from the tar the gas oil is the cheapest, is it?

A. Yes, sir.

Q. You hav*ing* said the lubricating oils were rather expensive, before?

A. Yes, sir.

Q. Gas oil is known as a refuse, is it not, or not——

A. No, there is nothing lost in petroleum except the gases which you cannot condense. There is a use for everything.

Q. You have not produced the gas oil yet?

A. No, sir.

4801 Q. Produce the sample of gas oil.

(Witness produces sample.)

Q. What is this sample that you now produce?

A. Gas oil obtained from Pennsylvania tar.

Q. Of what degree is that?

A. That particular sample is 40 degree Beaume.

Mr. PAGE: I offer it in evidence.

Sample received in evidence and marked State's Exhibit FFF.

Q. Is the oil State's Exhibit BBB a product from the tar?

A. Which one is that?

Q. The first one.

The MASTER: That is the New York sample.

Mr. MATHEWSON: Yes, from the Consolidated.

The WITNESS: I could not say as to that.

Q. What is this sample that you now produce?

A. Pennsylvania tar.

Mr. PAGE: I offer it in evidence.

Sample marked State's Exhibit GGG.

Q. What does that tar sell for?

A. 2¾ cents per gallon, tank price, works.

Mr. PAGE: You may cross-examine.

Cross-examination by Mr. MATHEWSON:

Q. How long have you been in the refining business?

A. Since 1891.

Q. What is your firm or concern?

A. Emory Manufacturing Company.

Q. Is that a corporation?

A. No, sir.

Q. Are you one of the firm?

A. No, sir.

4802 Q. Do you have entire management of the works?

A. Yes, sir.

Q. Where are they located?

A. At Bradford, Pennsylvania.

Q. How long have you had such entire charge?

A. Since 1896.

Q. Are you a chemist?

A. I have taken a course in chemistry, yes, sir.

Q. Do you hold any degree?

A. No, sir.

Q. Are you an engineer?

A. No, sir.

Q. Have you ever been connected as manager or in other responsible positions with any gas company?

A. Not a manufacturing gas company.

Q. Did you make tests yourself showing 34 degree for Exhibit BBB?

A. Yes, sir.

Q. What did you use to make the test?

A. Hydrometer and thermometer.

Q. What hydrometer?

A. Beaumé.

Q. Whose manufacture?

A. We used—I could not say just what one it was, but it was either a Carbondale Instrument Company's or Tagliablue.

Q. You spoke about a thermometer. Did you make any use of that in your tests?

A. Yes, sir.

Q. What use?

A. Made a correction for temperature.

Q. Did you make a correction?

A. Yes, sir.

Q. What was the temperature?

A. 74.

Q. And what did the test show at 74?

A. 35, a little over 35, I don't remember just what was in the stick.

Q. And can't you tell exactly what it showed at 74 degrees or 75 degrees?

A. I cannot remember just what it was. There are the corrections for it in the books.

Q. But I am trying to ascertain what the corrections were?

A. There is a regular book for that.

4803 Q. Haven't you any data here from which you can tell the temperature?

A. Well, roughly in the hydrometers, for each degree above 60 they add one to the reading, and each 10 degrees they add one to the hydrometer reading.

Q. Well, was that what you did in this case?

A. Yes, sir.

Q. You——

A. I took the reading on the hydrometer, 35.4 at temperature 74.

Q. And then to reach your standard temperature which was what?

A. I substracted 1.4 from it.

Q. Well, you stated in the direct examination that it was a little over 34. Then you could not have substracted 1.4.

A. It was about 34 gravity.

Q. Corrected to what temperature?

A. 60.

Q. Have you ever dealt in oil from the Kansas fields?

A. No.

Q. Nor in the fields of Southeastern Ohio?

A. Yes, sir.

Q. Do you deal in that oil?

A. Yes, sir.

Q. Do you buy and sell it?

A. Yes, sir.

Q. Have you ever dealt in oil from the fields of the other part of Ohio?

A. Not directly, no, sir. Our firm has.

Q. Have you dealt in oil of any of these fields except Pennsylvania, Western New York and Southeastern Ohio and West Virginia?

A. No, sir.

Q. Have you ever dealt in Texas oils or Indian Territory oils yourself?

A. No, sir.

Q. And the most you can do is to state then that sample BBB you think is not from any of the territories which you have mentioned; that is, Pennsylvania, Western New York, Southeastern Ohio or West Virginia?

A. Yes, sir.

Q. Further than that you could not state?

A. I could not tell, no, sir.

Q. Is not there sulphur in Ohio oil?

4804 A. Yes, sir. Not in the Southeastern, not in Monroe, Jefferson or Washington Counties.

Q. What do you call Southeastern Ohio, those three counties?

A. As to crude, it is the oil for which $1.58 per barrel is paid, the same as Pennsylvania oil.

Q. But I am talking about the territory. You say Southeastern Ohio. Do you mean the three counties you have just mentioned as Southeastern Ohio?

A. In the oil region we call it Southeastern Ohio.

Q. But I am trying to find out what you mean, because that is rather a broad term. The Southeastern Ohio, as you used the term now, in reference to this oil production, includes the three counties you have named?

A. Includes Jefferson County, Monroe County and Washington County, that I am familiar with in Ohio.

Q. Do you mean to say there is no sulphur in any of the oil produced in any of those counties?

A. No, sir.

Q. You do not mean to say so?

A. I know there is not.

Q. Then you do mean to say there is not?

A. I do mean there is no sulphur there.

Q. How about Southwestern New York?

A. That is what is known as Pennsylvania oil.

Q. Any sulphur there in any case?

A. No.

Q. Nor in West Virginia?

A. No, sir.

Q. And none in any of the Pennsylvania oils?

A. No, sir.

Q. Now the sample Exhibit CCC, which has been introduced here, if I understand you, is a distillate oil; is that right?

A. Yes, sir.

Q. Distilled from tar?

A. No, sir, distilled from crude.

4805 Q. And you say that it is a 34-gravity distillate and is used for fuel and gas oil?

A. Yes, sir.

Q. Then gas oil is not all produced from tar?

A. No, sir.

Q. It is produced by distillation from the crude oil?

A. Yes, sir.

Q. And the most of the gas oil that you are familiar with is produced by distillation from the crude oil, is it not?

A. Yes, sir, at least in our works. I am not familiar with any other refinery except ours.

Q. Now, the Emery Manufacturing Company is what is known, speaking of oil producers, as an independent concern, in that it has no relations with the Standard Oil Company, is it not?

A. No, sir, it is not.

Q. It is not a trust or anything of *our* sort?

A. No.

Q. Have you a pipe line?

A. Yes, sir.

Q. What is the name of that?

A. Emory Pipe Line.

Q. And it runs from where?

A. It is local, collecting lines, in the Bradford oil fields.

Q. And your operations in production are confined to the Bradford oil field, are they?

A. I have no production.

Q. Well, the Emery Manufacturing Company, or do they not produce oil?

A. No, sir, they do not produce oil.

Q. They simply refine?

A. Yes.

Q. And can you say from your own knowledge what the oil is which is sold by the Standard Oil for lubricating oil?

A. What the crude or different parts——

Q. Do you know what the description is?

A. They sell all kinds of lubricating oils.

4806 Q. You say there was a certain kind the Standard Oil Company sold for lubricating oil?

A. They sell neutrals, cylinder oils and paraffine oils and all grades of oils.

Q. Different grades for lubricating?

A. Yes, sir.

Q. There is not any special grade for lubricating oil, is there?

A. They have special oils for special purposes.

Q. To meet different machinery conditions?

A. Yes, sir.

Q. In reference to this export oil which you say is quoted at 4.4 cents f. o. b. the tank boat, New York Harbor, have you ever sold any export oil for use for gas making?

A. No, sir.

Q. Nor any of it in New York City, have you?

A. We have sold export oil on board the vessel in the harbor.

Q. That does not include the transportation across the Bay?

A. No, sir that is the price f. o. b. vessel.

Q. Of course it would not include the charge for unloading at the dock and the transporting to the place where it was used in New York City?

A. It would include the lighterage charge f. o. b. vessel.

Q. But it would not include the transportation across the harbor?

A. No.

Q. Or from the dock in New York to the place where it was to be used?

A. No, sir.

Q. Nor storage, of course?

A. No, sir.

Q. How much of this export oil 4.4 cents does your company sell in a year, say in the past year f. o. b. New York Harbor?

A. We do not sell any in New York Harbor.

Q. How much in Philadelphia Harbor at 4.35 cents?

A. About twelve to fifteen thousand barrels a month, 50 gallon barrels.

Q. How much would that be in a year, how much in a year do you deliver of that export oil, 4.35 cents f. o. b. Philadelphia?

A. It is not always the same, it depends upon the ships and the sales.

4807 Q. Generally?

A. Twelve thousand to fifteen thousand a month, one hundred and fifty thousand to one hundred and sixty thousand barrels a year, possibly more.

Q. How much does a barrel hold?

A. Fifty gallons, a refined barrel.

Q. A what?

A. We call a refined barrel 50 gallons and a crude barrel 42 gallons.

Q. This would be a refined barrel?

A. Yes, sir.

Q. And the difference between the export oil Exhibit DDD and the yellow oil from which oil Exhibit EEE would be, you say, only 1-16 cent per gallon?

A. Just across the shade, yes, sir.

Q. Now, I understand that No. 28 degree test Beaume oil which is produced from Pennsylvania oil sells for more than the 34 gravity oil?

A. More than the 34 gravity fuel oil, yes, sir.

Q. Well, more than the 34 gravity oil which you have introduced here as Exhibit CCC?

A. Yes, sir.

Q. How much more per gallon would it sell than Exhibit CCC?

A. We would not sell 28 gravity steam refined oil for less than 5¼ or 5½ cents a gallon at our works.

Q. And what would that mean f. o. b. New York Harbor if it was to be transported here? ?

A. In tank cars it would be 1.05 cents a gallon additional.

Q. Have you ever analyzed Texas or Indian Territory oils to know whether the base is asphalt there?

A. Yes, sir, I have analyzed Texas oil.

Q. And you found that to be so?

A. Yes, sir.

Q. When you speak of the most profitable oils in the treatment of petroleum, exactly what do you mean, the most profitable to the refiner?

A. Yes, sir.

Q. Well, what elements enter into that?

A. The price.

4808 Q. Well, expense of treating?

A. No, sir.

Q. You simply mean the price at which they are sold?

A. Yes, sir, the highest price.

Q. So what you mean when you say the most profitable oil, is that benzine sells for the highest price, and lubricating oils, 24 and 28 degrees next highest, and water white 47 degrees, next highest price, wax oil, 34 to 36 degrees, next highest, and then the export 73 Abel, is that it?

A. A-b-e-l, yes, sir.

Q. 44½ degree next, and then comes the tar and the distillates, if you distill the tar?

A. Yes, sir.

Q. And when you speak of the oil being the cheapest as you gave the list, you merely begin at the other end of the scale and go up?

A. The lower price, yes, sir.

Q. Will you tell me the percentages of production of these various oils which you have given in order of their selling price in a given quantity of petroleum?

A. Take 100 gallons of petroleum, we get 12 per cent. of benzine; the next, I believe, was the lubricating oils?

Q. Yes.

A. Fifteen per cent. of lubricating oil.

Q. And the next was water white, 47 degrees?

A. From our Bradford crude, we get about 12 per cent.

Q. And then the wax oil, 34 to 36 neutral oil?

A. The price of that is not the highest, but the wax at the price of the oil brings it up next in value.

Q. Well, altogether, how much does that amount to in percentage between the oil and wax?

A. I should say about 20 per cent. of that.

Q. And then the export 73 Abel?

A. About 6 per cent. lost, and the balance would be the export. It would be the difference between that and the 100 per cent. There would be 6 per cent. lost.

Q. Then 65 per cent. would be the export?

4809 A. No, 6 per cent. lost, leaves 6 there, and the balance would be the export.

Q. That would leave 65 per cent.?

A. It would not be that high, would it?

Q. No, 35 per cent.

A. Yes.

Q. And 6 per cent. is lost?

A. Yes, sir.

Q. What about the tar?

A. The tar comes in another process, that is the cylinder oil process.

Q. But where does that percentage come here, in reference to tar?

A. No, the other way it is 12 per cent. benzine and about 70 per cent. in refined and the balance would be tar and loss.

Q. In other words you mean there is about 12 per cent. of benzine and 70 per cent. of refined oil?

A. In the different processes of refining, yes, sir.

Q. This would make about 82 per cent.?

A. Yes, sir.

Q. And the balance is loss and tar?

A. Yes.

Q. Where does the tar come from?

A. From the crude.

Q. In what process?

A. In running to tar, we call it.

Q. And what percentage of the whole 100 per cent. original would you consider as tar?

A. About 7 per cent. tar.

Q. Now what portion of that 7 per cent. is gas oil if you distilled gas oil from tar?

A. About 12 to 15 per cent.

Q. About 12 to 15 per cent. of the 7 per cent?

A. Yes, sir.

Q. That would be 12 per cent. of 7 per cent., which would be about one per cent. of the crude, is gas oil, from tar?

A. Yes, sir.

Q. If you run it in that way?

A. Yes, sir.

Q. What is the benzine used for?

A. It is used for making gasoline, principally.

Q. For motor cars?

A. Yes.

4810 Q. And the demand for motor cars and so on has raised the price of benzine almost out of sight in the last few years, has it not in the last few years?

A. Yes.

Q. Now, do you know anything about the Muskogee oil, greenish in color?

A. Yes, sir.

Q. Is it not true that Muskogee oil, which is an Indian Territory oil has a parafine base?

A. Yes, sir, but there is very little of Muskogee oil produced.

Q. Well, are you sure that there are no other oils produced there and in Texas that has not a parafine base as well as the Muskogee oil?

A. Not that I know of. The Muskogee is the only one.

Q. As far as your information goes?

A. Yes, sir.

Q. Of course you have not examined all the wells in Texas and Indian Territory, and your statement is from information and not from actual tests, is it not?

A. I have examined the Muskogee oil and I have examined the Texas oil.

Q. There are various fields in Texas, are there not?

A. Yes, sir, several of them.

Q. Do you mean to say you have examined all of them?

A. I have examined oil from Spindle Top, the first well they drilled there.

Q. How much crude oil does the Emery Manufacturing Company handle in a year?

A. Do I have to answer that.

Q. You would rather not answer that?

A. I don't think that——

Q. I say would you rather not answer it?

A. Yes. It is published. We use about 1,200 barrels a day in our works, of forty-two gallons.

Q. How much 34 degree oil do you produce?

A. About 20 per cent.

Q. And the 28 degree gas oil, would be this additional one per cent. that we were discussing?

A. Yes.

4811 Redirect examination by Mr. PAGE:

Q. That additional one per cent., is that a 28 degree gas oil?

A. No, sir.

Mr. MATHEWSON: I did not intend to mislead you. I was thinking of the 28 degree oil.

Q. What degree oil is that?

A. Our gas oils, from 38 to 40 degrees.

Mr. MATHEWSON: That is from the tar?

The WITNESS: Yes.

Q. The tar is a distillate from the crude oil?

A. No, it is a residual, it is not a distillate.

Q. Well, when you put it through the next process, whether it is called distillation or not?

A. Yes, sir, it is called distillation.

Q. In your first process you distill these illuminating oils which you spoke of?

A. Distill the crude oil and the second we distill the tar.

Q. And then the residual is put through another process and you distill the tar?

A. Yes, sir.

Q. So that everything except coke is really a distillate of the crude oil, is it not?

A. Yes, sir.

Q. In the price that you have quoted on the 34 degree oil, you included the lighterage charge?

A. We include the terminal charge.

Q. I mean 45 degree, or whatever it is, this 73 Abel?

A. It includes the terminal charge.

Q. And you said also, I believe, f. o. b. on the steamer, which would include the lighterage charge?

A. The steamers go alongside of oil yards, alongside the pier.

Q. .Well, it includes the charge to the steamer for dockage, does it, is that what you mean by terminal charge?

4812 A. No, if it is shipped in tank cars, the oil is unloaded in the storage tanks, and allowed to stay there until the steamer comes to load, and the man owning the pier gets the charge from the steamer.

Q. You deliver it alongside, f. o. b., then?

A. Deliver it into the ship.

Q. Then this price includes the storage charge?

A. Unloading the tank cars.

Q. And unloading the tank cars?

A. And pumping the oil from the storage tank into the vessel.

By Mr. **Mathewson**:

Q. Is the tar distilling process which you have described, and from which you get this one per cent. of gas oil, supplementary to the process which you first described?

A. Yes, sir.

Q. It is not an independent process apart from the process that you first described?

A. It is an independent process from the crude, yes.

Q. I think you have answered the question both ways. Won't you make it clear? I don't understand, quite. I asked you first is the tar distilling process by which you obtained the one per cent. of gas oil supplementary to the process which you first described?

A. No, sir, it is not supplementary.

Q. Or is it an independent process?

A. It is an independent process.

Q. Apart *for* the process you first described?

A. Yes, sir.

Q. Is not the tar obtained by the first process?

A. Yes, sir.

Q. Then it is an independent process?

A. Yes, sir, both.

Q. What makes the difference between the white Exhibit DDD and the yellower Exhibit EEE from which Exhibit DDD comes?

A. Exhibit EEE is a white distillate.

Q. I understand that, but what element is it which is eliminated to produce the white oil?

4813 A. The color or impurities are absorbed by sulphuric acid.

Q. Do you know what the impurities are which are so absorbed?

A. No, sir, nor anybody else, I guess.

By Mr. PAGE:

Q. Your gas oil which you produce in the independent process from tar could be produced in the same distillation, could it not?

A. Yes.

Q. Without treating it in an independent process?

A. You could not get this oil FFF from the crude, you get this from the crude, Exhibit CCC.

Q. And the Exhibit CCC is of more value or brings a larger price than the Exhibit FFF?

A. Not with us; it brings the same price.

LEWIS EMERY, JR., called as a witness in behalf of the defendant, the State of New York, being duly sworn, testified as follows:

Direct examination by Mr. PAGE:

Q. Senator Emery, where do you reside?

A. Bradford, Pennsylvania.

Q. What is your occupation?

A. Oil producer and refiner and several other lines of business.

Q. What is your position in the Emery Manufacturing Company?

A. I am the proprietor of it.

Q. You say that you are also an oil producer?

A. Yes, sir.

Q. And where have you wells, Mr. Emery?

A. In nearly all the oil fields.

Q. Have you in the Indian Territory?

A. Yes.

Q. And Texas?

A. Yes, sir.

Q. Do you have in the different Texas fields?

4814 A. No, really there is not very much field there now, it is pretty well played out.

Mr. MATHEWSON: Did he name the fields?

The WITNESS: I can name you the fields which were producing oil in large quantities.

Mr. MATHEWSON: No, but I did not know in what fields you said you operated.

The WITNESS: Well, they were in Matagorda and Humble.

Q. You are familiar with the prices paid for oil in the different sections?

A. Yes, sir, wherever we have production, and with the prices where do we not produce.

Q. What is the price at the well of what is called Pennsylvania oil?

A. $1.58. There are some grades of oil in Pennsylvania field that bring a higher price than $1.58 at the wells.

Q. Is that a 42-gallon barrel?

A. Yes, sir. There are only one or two fields, there is the Tiona field, I think that is the only field.

Q. The price $1.58 is per barrel, is it?

A. Per barrel of 42 gallons each at the well.

Q. What are the prices paid for Texas oils at the well?

A. I don't know, I have a list here I think some place.

Mr. Mathewson: Well, I think the witness should testify from his own knowledge. He ought not to testify from circulars.

The Witness: Well, the last we sold over there about two months ago, we got 35 cents for it.

Mr. Mathewson: At the wells?

The Witness: Yes, sir, at the well.

4815 Q. Now, what is the price in other fields where you have wells?

A. In the Kansas field, according to the gravity, 32 gravity brings 39 cents. We have a very large production there for which we obtain 39 cents. It is sold, at least, on gravity.

Q. And the Indian Territory?

A. The same, Kansas and Indian Territory, based on gravity. It is known as Kansas in the market, not as Indian Territory.

Q. Do you know of 28 degree gas oil?

A. No, sir, I do not.

Q. There is none of that 28 degree gas oil produced from the Pennsylvania oil?

A. No, sir. That is in the lubricating gravities, in the Pennsylvania oils.

Q. Do you know whether that would be a lubricating gravity in Texas oil?

A. No, I do not.

Q. Do you know as to the gravity of the crude oil, the difference between Texas oils and the Pennsylvania?

A. The difference in gravity, yes, sir.

Q. Will you state what that is?

A. The Texas runs about 23 and that of Pennsylvania ranges from 40 to 45.

Q. From your knowledge of the Texas oil and your knowledge of the Pennsylvania oil, could you produce the 34 degree gas oil from Texas oil at a lower price than you could from the Pennsylvania oil?

A. Yes, sir.

Q. And sell it at a much lower price?

Mr. Mathewson: Whether you could sell it for a much lower price? It is not a question of ability; it is the inclination. I suggest that it is a conclusion.

Q. Well, it could be produced for very much less?

A. I didn't understand your question.

4816 Q. I say it could be produced for very much less?

A. You mean per barrel?

Q. Per gallon.

A. In manufacturing it or the production of the oil, the cost of production.

Q. Take the cost of production of your Texas oil, could you produce a 34 degree gravity oil at a much less price?

A. Are you referring to the cost of producing it or refining it?

Q. Both combined; at a less price than you could from the Pennsylvania oil?

A. That is very problematical. I don't know what it costs to produce a barrel of Texas oil on an average. It has been an uncertain field and an expensive one.

Q. I refer to the prices you have given as to the selling price at the well——

A. If you refer to the cost of manufacture, buying and purchasing and manufacturing it, you can produce oil much cheaper than for an oil you pay 35 or 40 cents than $1.58.

Q. That follows from the difference in the price of the crude oil?

A. Certainly.

Q. Now, as to the lubricants and the degree of the lubricating oil, how does that vary with the figures of the crude oil? Would you get as much lubricating oil from a Texas oil of from 23 to 28 degrees Beaume as you would from the Pennsylvania oils which run 40 to 45?

A. Lubricating oils?

Q. Yes.

A. I don't know. We never run any lubricating oils on any oils of Texas at all, and I don't know what the percentage of lubricating oils is. I do not know anything about it. Certainly the quality is not there. The prices are very much cheaper in lubricating oils made from Texas oils than they are made from the Pennsylvania oils.

Q. Did you make an examination of this sample, exhibit BBB?

A. I closely observed when the examination was going on, I observed every moment. I did not handle the instruments but I saw it.

4817 Q. Did you subject the oil to the test of smelling it?

A. I did.

Q. Can you tell from that where the oil came from?

A. It is an oil that contains sulphur. It is not a Pennsylvania oil, in my judgment.

Q. Are there any other facts that lead you to the same conclusion, that is, that it is not a Pennsylvania oil, besides the smelling it?

A. No, I don't know that there is. That can be ascertained from what we call the "chilling" process; tell very quickly.

Q. But you did not subject it to that?

A. No, sir, we did not. We could tell whether they are asphalt oils or para-fine oil by the "chilling" process.

Q. Are there any other fields in which that you are familiar with the prices of the crude oil at the well?

A. Yes, sir.

Q. In keeping yourself informed as to the quotations?

A. Yes, sir. In Indiana I know the prices there, and we have a production in Ohio and in Illinois.

Q. Outside of what is known as Pennsylvania oil?

A. Yes, sir.

Q. Give those prices?

A. We also have a production in Eastern Ohio; that is produced from what you call the white sand oils; Western Ohio and Indiana oils are produced from Trenton limes, which contain the su*pl*hur.

Q. What are the prices of those oils that contain the sulphur?

A. Ohio oil brings 85 cents, Indiana 85 cents, and Illinois 67, or 64 at the present time. There is a grade of oil in Ohio in the Lima district that brings 90 cents. That is per barrel of 42 gallons each.

4818 Q. From these oils also the 34 degree oil could be refined and produced at a less price than from the Pennsylvania oils, could it not?

A. Yes, sir, certainly.

Q. And how about the 28 degree?

A. Well I don't know that product.

Q. Well, 28 degree is an entirely different product?

A. Yes, an entirely different product. I don't know how they get it, I don't know what it is, I never saw any of it.

Q. The Standard Oil Company have agreed to furnish within two years and eight months 255,000,000 gallons of oil, 40 per cent. of which must be 34 degree Beaume oil. Could that amount of oil be produced in the Pennsylvania field, in the Pennsylvania oils?

A. It could be produced, certainly. There is a production in Pennsylvania, in the Pennsylvania field, of 62,000 barrels a day or 2¼ millions a year. It could be produced from the oil, but whether it could be produced from the tar—possibly it could be produced from the tar, based on one per cent.

Q. That is from the entire field of the Pennsylvania oil?

A. Yes, sir, that is the entire production of the Pennsylvania oil.

Q. Could it be produced from the wells owned or controlled by the Standard Oil Company in the Pennsylvania fields?

A. Oh, no, not from their wells, because they are transporters; they are not as a rule producers. They have got production, but not sufficient, I assume, to produce all the gas oil that they sell.

Q. From what you know of the oil market for Pennsylvania oil, knowing what others buy and what others take from that field, would it be possible to fill this contract?

A. Now, that is a very broad question. They certainly could, because they could fill that by taking the whole body of oil. There is no question about it. They could run it all into you, as 4819 far as that is concerned, but if you are getting down to the question of getting it from the tar or getting it from what we call a tar distillate, that is another thing.

Q. Could they furnish 34 degree oil at less than five cents a gallon?

A. Could they?

Q. Without losing money?

Mr. Mathewson: Objected to.

The Master: I think you are getting pretty far, Senator.

Mr. Page: I think so myself. I certainly misunderstood what the witness told me in my office.

Q. What is meant in the oil market by a homogen-ous oil?

A. Well, I suppose it is a kind that is very seldom used, and I suppose it is an oil distilled, take the crude oil distilled, and all the qualities coming from that distillation when mixed give homogeneous, but the term is something that is very unusual and I do not understand it. We understand about homogen-ous steel but I never saw that in a contract and I never saw the term used before in my life.

Q. It really has no——

A. I don't see any significance to it, it is not a trade term.

Q. Could you take State's Exhibit EEE and mix *taht* with a 28-degree gravity oil and produce a 34 degree gravity gas oil?

A. Yes, sir.

Q. And that would be a lower priced oil than the 34 degree oil of the Pennsylvania fields, would it?

A. It would be a lower price.

Q. An oil that could be sold at a lower price or would it be produced at a lower price?

A. If you take the Pennsylvania product, do you mean?

Q. Not taking 28 degree Pennsylvania?

A. Yes, sir; a less price.

4820 Q. Taking the 28 degree oil from other fields?

A. Yes, sir.

Q. You have read or heard read the contract between the Standard Oil and the Consolidated Gas Company that is in evidence here?

A. I saw a portion of it, relative to the price, yes, sir.

Q. Is there anything in that contract that leads you to suppose or believe that it does not call for Pennsylvania oil, and if so state what?

Mr. MATHEWSON: If there is anything ambiguous in the contract it might be susceptible——

The MASTER: I think that question is objectionable, Senator.

Mr. PAGE: I will withdraw the portion which says "If so, state what".

A. It does not specify what field it is to come from.

Cross-examination by Mr. MATHEWSON:

Q. You spoke of Texas oil and their selling at 35 cents at the well. What gravity?

A. About 23.

Q. And you say that the supply is pretty nearly gone in Texas?

A. Yes. It is principally confined to the stocks.

Q. "Petered out", as the expression is?

A. Yes.

Q. Is all Texas oil of the same gravity?

A. All that I know of.

Q. The same in Kansas and Indian Territory?

A. No, sir.

Q. Well, I mean is all Kansas oil the same gravity?

A. No, sir, that varies. There is some down there as low as 18 degrees.

Q. Eighteen to what?

A. Up to 32. There is a little up there produced at 37.

Q. And when you say 39 cents you refer to the 32 gravity oil?

A. Yes, sir.

4821 Q. How about Indian Territory?

A. Same thing. It is all sold on gravity.

Q. You said that you did not know of a 28 degree gas oil?

A. No, I do not.

Q. If a contract was made for gas oil of less than 28 degrees you would expect it to run over 28 degrees, wouldn't you, in test, on the average?

A. It would be 28 or above.

Q. You would expect it to be above, wouldn't you?

A. No, not necessarily. I would expect it to be according to the contract. It can be made so.

Q. When you say then that you do not know of 28 degree gas oil, what did you have in mind?

A. I don't know. This is a merchantable product in our works.

Q. When you were asked whether 34 degree oil could be produced from Texas oil down to the final delivery, including the production and the refining and the transportation to a given point, say New York City, I understood you to say that that was something that you could not tell?

A. No. I said it could be produced cheaper.

Q. What were you about to say in that line?

A. I don't know.

Q. Didn't you say you could not tell?

A. No, I said I could tell. I said when you get down to ask as to the cost of producing oil in the Texas field that I could not answer that. The misunderstanding was whether producing a refined product or producing it from the earth.

Q. Can you get as much 34 degree gravity oil out of a gallon of Texas oil as you could out of a gallon of Pennsylvania oil?

A. No, because there is more—there is a larger percentage of base product. It is asphalt and tar and so forth.

Q. Taking a gallon of Pennsylvania oil and a gallon of Texas oil, the value of the 34 degree oil that you would get out of the 4822 Pennsylvania oil would be greater than the value of the 34 degree oil which you get out of the Texas oil?

A. Based on the cost of crude, certainly. That does not mean but what you could produce it very much cheaper from the Texas oil.

Q. No, it may not, but it would not be in proportion to the cost, because if you have Texas oil at 35 it is only 23 gravity.

A. If you take it in the proportion to the cost, why Texas would be away down below it. Produce it for half the money; less than half the money.

Q. You could produce it at the wells?

A. No, sir; produce it as a product, 34 oil.

Q. If the refinery was in Texas?

A. Yes, transportation is no more from there than it is from our place, by ship.

Q. You have to transport it to the ship from the Texas oil fields?

A. Yes.

Q. And then ship it?

A. We send oil to Germany to-day cheaper than we can send it from our refinery to New York.

Q. You sell it in Germany cheaper than you do in New York?

A. Yes.

Q. So that the price of oil exported is not necessarily the price at which you can purchase it in the United States?

A. No, sir.

Q. And that is so of many things?

A. There is a combination in the United States that they won't permit in Germany or any other foreign country. That is what we are fighting against.

Q. That is true of a great many other things?

A. Yes, we take the cake in this country for sole proprietors. That is what we are against.

Q. You are an independent producer?

A. I am, sir; and a refiner.

4823 Q. And a competitor of the Standard Oil Company in that field?

A. Yes, sir.

Q. Supposing you took Pennsylvania oil and mixed it with a small portion of oil from another field which had sulphur in it, then, of course, the mixture would show sulphur, no matter how small the admixture of other oil might be?

A. Certainly, there would be some sulphur in it.

Q. In other words, it would not indicate that all of the oil came from outside Pennsylvania, from the fact that in a particular oil you found some sulphur?

A. I think the tars all run together and are distilled—the tar from Texas, tar from Pennsylvania, tar from Ohio. It makes just as white a candle and makes just as good wax, if there is any wax in it.

Q. You were asked whether an admixture of the 28 degree oil with Pennsylvania 34 degree oil would not cost less than the 34 degree oil. As a matter of fact you would take Pennsylvania oil 28 degree and Pennsylvania oil 34 degree, it would cost more than the 34 degree I mentioned, wouldn't it?

A. It would on your prices, yes, sir. The prices you get for it.

Q. It would on the price you get for it?

A. No; not if they buy their oil in Texas at 35 cents.

Q. No, I am not talking about Texas. I say if you take 28 degree oil produced in Pennsylvania and mix it with a 34 degree oil produced in Pennsylvania, the mixture would be worth more than a 34 degree oil alone of the same quality?

A. I say not based upon your contract.

Mr. Page: My question was as to a mixture of 28 and 45, not 34.

Q. Well, you take the export oil, 44½ degrees produced in Pennsylvania and mix with it Pennsylvania oil of 24 and 28 degrees and the mixture would be worth more than the same quantity of 44½ degree oil straight, wouldn't it? 4824

A. When we get up into those gravities it is lubricating oil and it is more valuable. We do not do that.

Q. I know you do not do that, but if you did do it the mixture would be more valuable than the export 44½ degrees?

A. It depends entirely upon the price of the lubricating oil, the price of the goods.

Q. Yes, but your son has testified that you get more for the oils of 24 to 28 degrees?

A. Certainly we do.

Q. Than you get for the export oil of 44½?

A. Certainly. It is on account of the viscosity.

Q. Then a mixture half and half we will say of 44½ degree oil and of the 24 to 28 degree oil would be——

A. Of all lubricating oil, you mean?

Q. Yes, would be worth more.

A. Because our lubricating oil brings a higher price than the 34 does.

Q. And it brings a higher price than the 44½ export?

A. Now, I will say yes, but if you take this gas oil and mix it with lubricating oil you will get a less price.

Q. Which gas oil?

A. This, this gas oil.

Q. That is Exhibit FFF, from your tar product?

A. Yes. That is what I suppose that the gentleman (Mr. Page) meant in his question.

Mr. Page: My question was not based on the 28 degree Pennsylvania oil. I excluded that.

Mr. Mathewson: I understand.

The Witness: Now, I say yes, if you take 28 degree lubricating oil it brings a higher price than the illuminating, but we do not do that. This is what we sell for gas oil (Exhibit FFF).

Q. I understand, but if you were to do that the mixture would be worth more?

4825 A. Yes, but in our 28 oil and the 28 from Texas or Kansas, there is just as much difference as there is difference between day and night.

Q. So it has been testified.

A. Yes. You see, if I may be permitted to answer that question a little bit further: There are 200,000 and odd barrels of oil handled every day now, of the pipe lines from the wells. The other they put in storage or manufacture. Of that there is only 62,000 barrels of high grade oil per day.

Q. What do you mean by high grade oil?

A. I mean the Pennsylvania, $1.58. All the rest are second-grade oils running down as low as 28 or 26 cents a barrel.

Q. I see it is alleged in the Government suit against the Standard Oil Company in St. Louis that the Standard Oil Company sells, as I recollect, over 90 per cent. of the entire product of the United States in petroleum oils?

A. I think so. I would not be surprised if that was so. We cannot ship ten rods from home hardly, on the railroads.

Q. The contract dated November 1st, 1905, between the Standard Oil Company and the Consolidated Gas Company to which reference has been made, calls for 40 per cent. of 34 gravity, with the privilege to the company by a certain notice of taking 45 to 50 per cent.?

A. Yes.

Q. Now, when you say that the Pennsylvania oil fields would produce enough in two years and eight months to furnish that amount of oil, 34 degrees Beaume, do you refer to the fields that are controlled by the independent producers or by them and the Standard Oil Company together?

A. I referred to the fact that they could deliver you any amount of oil under that contract if they only ran it down to 28 and gave it to you.

Q. From the Pennsylvania field?

4826 A. Certainly they could, if they distilled it down to 28 and gave it, yes; distilled it down to 28 and give you the balance, give you any quantity of it.

Q. Does the Standard Oil Company control then, substantially, the greater part of the output of the Pennsylvania fields?

A. They control the transportation of it.

Q. Do they not control the output?

A. No, sir.

Q. Don't they sell the output of the greater part of the Pennsylvania field?

A. Certainly they do. I am talking about the controlling of the production. You are talking about the control of the market. They have the control of the market, supreme.

Q. I am talking about the control of the output when it goes to the consumer, and ask——

A. Yes, certainly.

Mr. Page: That is the same as the market.

The Witness: They make the market. That oil to-day is worth more money that we get for it, but they have the ability to get more out of these gas companies because they are the sole proprietors of this transportation and they oblige the producer to sell his oil for less than it cost.

Q. That oil to which you just referred is export oil, DDD, isn't it?

A. They would make more money entirely if they used the crude oil.

Q. That is the export oils DDD, to which you referred?

A. Yes, and we are selling that at less than they are paying you for this oil product distilled, which we used to throw in the streams.

Q. And less than it is worth, you say?

A. Less than it cost, and the other they are selling at a great deal more than it costs, an enormous, big profit.

By Mr. Page:

Q. What is the price at which you sell that 34 degree gas 4827 oil which is made from tar?

A. No, that is not made from the tar. That is a distillate—it is a neutral. This is the tar (Exhibit EEE).

Q. The neutral is Exhibit CCC?

A. That's it. Now, they will get about 20 per cent. of that stuff out of your products, if you want it.

Q. The question is at what price does that sell?

A. What we sell it for?

Q. Yes.

A. 3¼ cents.

By Mr. MATHEWSON:

Q. Where?

A. At the works.

Q. How much f. o. b. Philadelphia?

A. Well, we add to that $1.05 for freight per gallon and that makes it 4.30.

Q. That would mean delivered on the other side of the harbor?

A. That means in Jersey.

Q. And does not include the lighterage and the transportation form the dock on this side to the consumer?

A. No, sir.

At 1:15 P. M. a recess was declared till 3 P. M.

After Recess.

HENRY H. EDGERTON resumed.

By Mr. PAGE:

Q. Mr. Edgerton, have you given some consideration to the question of delivering gas in the City of New York at a more uniform pressure?

A. Yes, sir.

Q. In what way should the gas be delivered to the mains from which services are taken off at a more uniform pressure than it is now?

4828 A. The system would involve a few high pressure mains running up to 15 or 20 pounds or to such a pressure as would not impoverish the gas to any appreciable extent, and govern the pressure of the gas into the service mains of the company by means of a governor or by means of valves, regulated by hand or a workman if preferred, although the governor would be the most equal method and its action could be watched by a watchman at the important points.

Q. Taking into consideration the New York condition, where would you place those high pressure mains?

A. The high pressure mains run on each side of the City, being made of the largest diameter near the most important and congested districts, and running parallel with the shore, running from the Battery to the Ship Canal. I have estimated on the delivery of 8,000,000 cubic feet per hour under a pressure of 15 pounds in two mains of 24 inches diameter. The mains could be reduced from 24 inches to 20 inches, 16 and 12 inches toward the ends. And from these mains deliver by the governors into the larger mains and also into the service mains. There would be no need in this provision of which I speak to lay pipes across the City having any considerable pressure at all. The present piping being so nearly adequate to delivering an equal supply, that governing them into the large cross-mains would be all that is required. By such a system as this I am satisfied that the pressures could not only be controlled within a variation of an inch and a half, but possibly one-fifth of that. I have put in such a system, and I find that by using that in connection with the governor in the low pressure mains that the gas can be supplied with the greatest regularity, much more so than by using large mains as supply mains.

4829 Q. By the supply mains——

A. I mean what some one called trunk mains.

Q. How would you proportion these mains? You stated, starting with a 24-inch main and after that proceeded some distance, with a 20-inch main and a 16-inch main.

Q. Well, the question of proportioning the sizes would be dependent upon making observations in the district and ascertaining where the greatest amount needed to be delivered. Of course, I could not more than suggest the length of the 24-inch main on each side, it probably would be restricted within three or four miles in length, possibly less.

Q. And do you think that those pressure mains could be connected with the present system of pipes without great changes in their distributing system?

A. It would not require any change at all in the distributing system, only a due regard to the points of introduction of the gas by means of the governor and the selecting of a governor of a reliable character to handle the gas.

Q. What do you say as to the operation of this system after it was installed, the cost of operation?

A. I may say to begin with, to explain, that as early as 1871, after having made analysis of the gas, and ascertaining the permanent character of the gas, and that it did not lose but very little light on compression, I introduced a system of compressed gas on railroad cars, first, and that led to finally the use of the compression system as a means of distribution. The beginning of it as a means of distributing to low pressure mains, was in 1889, and it has continued successfully ever since. Also I used the same system as applied to manufacturing gas in one locality and transferring it to another locality. That has given data in regard to the cost of compression which is sufficiently reliable. I have made a calculation that,
4830 assuming the greatest output in New York City to be 8,000,-
000 of cubic feet in the heaviest hour's output, taking a pressure of 15 pounds per square inch, the cost per horse-power of one-half cent per horse-power hour, the cost per hour during the heaviest hour would be about $30 for compressing all the gas in New York City. I have also been in consultation with parties furnishing very large compressors to the natural gas fields, and have made quite a number of investigations in the use of those pumps, so that I know they op-

erate quite as well on a large scale, and better even, than they do on the small scale on which I first introduced them.

Q. Is there anything more that you desire to say on that subject that has not been covered by my questions?

A. Well, I might say that I saw in New York an arrangement for pumping gas through mains, the only difference being that the pumping was carried at such moderate pressures that they did not develop anything like the economy that the system is capable of. For illustration here, I have taken the amount of gas delivered with a loss of one inch water pressure to three thousand yards of main pipe, 24-inch main pipe.

Mr. MATHEWSON: Where, here?

The WITNESS: No, this is simply to give a basis. They would deliver about 92,000——

Mr. MATHEWSON: I shall object to that.

Q. That is just a verification of your figures?

A. It is to show the immense economy in main investment that could be accomplished by putting the gas at a little higher pressure than the ordinary pressure. The delivery increases through a pipe a little over the square of the diameter of the main and therefore——

4831 Q. What do you mean by that?

A. I mean a main of 8 inches would take more than four times as much gas as a main four inches.

Q. Under the same pressure, do you mean?

A. Under the same pressure. Then again——

Q. As you increase your pressure how does that increase the delivery?

A. As you increase the pressure it increases by the square root of the pressure, not directly but of the square root very nearly.

Q. You say you have observed some pumping of gas in this City. Where, in the works of the Consolidated do you mean?

A. Yes, I saw them have an exhauster, a gas handling station at the 14th Street Station in which they have engines and a pump of lower capacity; that is, it is in the form of an exhauster and is used to transfer gas around the mains in various directions. I did not note all the connections they had on a board which indicates it, but I saw the station was for the purpose of delivering gas independent of delivering it through ordinary mains, I took it to be. I also read a paper by Mr. Bradley in regard to pumping in downtown.

Q. Mr. Bradley I believe stated that they pump now to the lower districts I think, from one of their uptown districts, from 14th or 21st Streets, to Canal Street, didn't he?

Mr. MATHEWSON: I think to Bowling Green.

Mr. PAGE: It supplies the lower part of town.

Mr. MATHEWSON: It goes to Bowling Green.

A. The capital investment for a thousand feet of gas, to deliver gas in that manner, if carried at 15 pounds pressure would be something like—well, I have not the figure here, but it would be less than one-fifth.

Q. One-fifth of what?

4832 A. One-fifth of the cost of delivering it under the ordinary pressure now used.

Q. Are such systems of delivery under high pressure as you have described and then distributing it to mains to which services are attached at a much lower pressure, in use?

A. Yes, sir, there are quite a number of such cases. They are pumping gas now, in a great many localities; in fact, I have not been able to keep track of them, but there is a large number in the journals and other sources of information are daily showing an increase in that direction; several papers have been written and read before association meetings in that regard.

Q. And it is a well known system of distribution?

A. Perfectly.

Q. And as you have indicated, could be applied to New York conditions?

A. In fact, it has got to be applied here. There is no more avoiding it than there is avoiding—it has got to be done in order to keep up with the increase of consumption in New York. It is the only available means of doing it.

Q. Have you made an examination of the station record book at 21st Street station, which is Complainant's Exhibit 243?

A. Yes, sir.

Q. And a similar book at 44th Street station, which is Complainant's Exhibit 244, and of the 99th Street station, which is Complainant's Exhibit 245?

A. Yes, sir.

Q. Now, in regard to Exhibit 243 of the 21st Street station, have you made extracts from that?

A. Yes, sir, I have a recapitulation here of their monthly results during the year 1905, showing the amount of gas made and corrections for temperature, total gas sent out to consumers, oil gas to 14th Street, 18th Street, 42d Street, maximum output and minimum, fuel used in generators and in the boilers, oil used per thousand in gallons, oil used, candle power at the station corrected for temperature, candle per gallon of oil used, gravity (Beaume) of oil,
4833 amount of oil and all the other data of importance; drip
oil. It is comprehended in these two sheets.

Q. Never mind giving all that. I do not care for all those things. It is part of Exhibit E of City's Exhibit 87?

A. Yes.

Q. Now, Mr. Edgerton, have you prepared in convenient form and from this exhibit a comparison of candle powers, yield and quality of the water gas?

A. Yes.

Q. And upon that stated the City Inspector's tests for candle power for the same period?

A. Yes.

Q. You may state how the City Inspector's candle power was arrived at.

A. I took the City Inspector's candle power from the records at Mr. Lacombe's office, the City Inspector——

Q. The City Inspector makes tests, however——

A. They are made once a week.

Q. Up to July 1st?

A. Up to July 1st, and from that on they were made daily except occasionally on Sundays——

Q. Then up to the month of January as stated you arrived at that by taking the average of the tests for that month?

A. Yes. In regard to candle power, I have both the candle power at the station and the candle power by the City Inspectors, also the average gravity of the oil in gallons of oil used per thousand cubic feet.

Q. Taking the candle power at the works, did you take the corrected candle power as stated on Exhibits 243, 244 and 245?

A. Yes.

Mr. Page: I will offer this in evidence.

Mr. Mathewson: I have no more objection to this than I had to the original exhibit. I make the same objection.

The Master: Same ruling.

Mr. Mathewson: Exception.

Paper marked State's Exhibit HHHH.

4834 Q. From this exhibit, as a person having experience of the manufacture of gas, what do you find with respect to the heavier and lighter oils?

A. While there are some anomalous results reported here, I find that there is no great difference in results. Take the month of April——

Q. What do you mean by that?

A. In results from the oil. Taking April, for instance, there was an average gravity of 33.80.

Mr. Mathewson: At the 21st Street station?

The Witness: At the 21st Street station. I may explain about getting the average gravities——

Q. No, go on with your statement.

A. 33.80. The oil used was 4.47.

Q. Gallons per thousand of gas made?

A. Yes. Candle power corrected at the station 25.07. Taking an extereme difference, the average gravity of oil in July of 28.38, the gallons of oil, 4.83, the candle power is 27.72.

Q. That is the heavier oil, 28.38, produced more gallons of oil per thousand——

A. More candle power.

Q. With a slight increase?

A. There is a slight increase in the gallons of oil per thousand, but taking the month of October, for instance, 29.70, with 4.66 gallons, the candle power still keeps up to 26.38. The most instructive comparison, perhaps, is shown between April and May. April has practically the 34 degree oil; the gallons are 4.47——

Mr. Mathewson: That is a mistake. I don't know whether there are any others, but that is 4.49, according to the exhibit attached to the report.

Mr. Page: For April?

Mr. Mathewson: Yes, 4.49 and not 4.47.

The Witness: Well, that is all the better.

4835 Mr. Mathewson: That may be, but I am simply calling attention to the fact that the present exhibit is not in that regard accurate.

Mr. Page: Then correct it.

The Witness: Well, correcting it to 4.49 the candle power corrected at the station was 25.07 and in May, using 29.53 oil and 4.51 gallons, the candle power is 25.50.

Q. I call your attention to the month of June?

A. The month of June——

Q. Where the same average gravity oil was used as in May?

A. Yes, and in gallons per thousand 4.45 and candle power 26.85.

Q. And the loss in the city test in both of those, in one it is 3.38 candle power and the other 3.67?

A. Yes, but the most significant loss is on the month of May, where there is a loss of 5.09.

Q. What deduction do you make for these facts, Mr. Edgerton?

A. I can fairly say that that coincides entirely with my own experience in regard to the use of oil, that I would not give any preference to that lighter oil; in fact, the heavier oil contains a larger body of carbon and would stand more water gas.

Q. Does it show from their actual operations that practically the same result and the same variations are produced from each oil?

Mr. Mathewson: If they do, it seems to me the exhibit itself does show it. If it does not, it does not. I object to that as a conclusion which it is not fair for the witness to draw.

The Master: Well, you can ask him if that is his conclusion from the figures shown on that exhibit and to state his own opinion on it as an expert.

Mr. Page: Yes.

4836 Mr. Mathewson: I object to that also.

The Master: That I will allow him to do.

Mr. Mathewson: Exception.

A. Yes. There is essentially no difference.

Q. If you have anything else you want to point out on this——

A. 21st Street station is not the only one showing that. Taking the 44th Street station in the month of April the average oil was 34.48, gallons per thousand used 4.38, candle power 23.48. In May with practically 30 degree oil, 30.08, and using 4.40 gallons, gives a higher candle power, 24.14.

Q. Comparing the month of July with the month of November, what do you find?

A. The month of July, the oil averaged 29.01 and the candle power 28.06, but in the month a larger amount of oil was used.

The most anomalous results were shown in November and December, in my judgment, where the lighter oil is shown to manufacture gas tested by the City Inspectors of higher candle power than it is tested at the works.

Q. That is in the month of December?

A. That is in the month of December.

Q. The month of November shows a very slight variation?

A. The month of November a very slight variation, and I do not think anybody ever found such a case before. It is the uniform result throughout the country, no matter whether you use naphtha or the lightest oil, that you have always got to use more candle power in the winter and that there is a loss from condensation of illuminating power in the holder and to some slight extent in the mains, and here we have the anomaly that this oil raises the candle power higher in the mains than at the stations. I think that would require very considerable explanation. In fact the conditions
4837 here are reversed; candle power loses in the summer time and stays steady in the winter. It is remarkable.

Q. What is there in the heavier oil that in your experience has made it as good if not preferable to use than the lighter oil?

A. In various forms of apparatus the heavier oil has got more carbon and will stand more water gas and will give a higher result in candle power, than the lighter; although it gives a less number of cubic feet per gallon, it can be diluted more largely with the blue water gas than the lighter oil.

Q. What is there in the oil that gives it its illuminating value?

A. The carbon.

Q. And you find in the heavier oils more carbon?

A. They are more rich in carbon except when used in the Welsbach burner, and in that case it is the intensity of heat of combustion.

Q. Yes, the quality of the flame has nothing to do with the light from a Welsbach burner, has it?

A. No.

Q. That is the reflection from the incandescent of the mantle largely?

A. That is true, however, it is always the same increase or ratio of light with the Welsbach burner as it is with the common burner. I have tested gases varying all the way from 11 candles up to 40 candles with the common burner, and the same variation will be noted, if the Welsbach is properly adjusted, on the Welsbach burner.

Q. Referring to the same exhibit, what do you find with regard to the production of tar, the percentage of tar?

A. Following the use of 20,058,206 gallons of oil during the year——

Q. At what station?

A. At the 21st Street station, the residual oil or tar is 4,183,891 gallons or 20.81 per cent.

4838 Q. What did you find at 44th Street?

A. I found at 44th Street 24.7 per cent. and at 99th Street 25.8 per cent.

Q. How does that result of the percentage of tar correspond with your experience and with your observation of other plants?

A. I think that is an excessive amount of tar.

Q. Upon what do you base that?

A. Upon my own experience I have had the tar separated from water very carefully and at Danbury our tar amounts to five per cent. on the amount of oil used, tar drip.

Q. How is it at Lowell, if you have made any study of that?

A. At Lowell it is stated in the Massachusetts report as 3.70; at Fall River 12.1 per cent.; that was from the Massachusetts report of —I think it was the 20th Massachusetts report. I am not so certain about the Massachusetts figures, however, as I am about the Danbury results.

Q. From your experience, is from 5 to 10 per cent. about normal?

A. I think 5 to 10 per cent. would cover all the loss from different apparatus, although I noted that the loss is still greater as made by the Consolidated Company in its retort process, amounting in some cases to about 33 per cent., one-third.

Q. What is there in the production of carburetted water gas that would lead to the excessive percentage of tar?

A. Well, in the operation of alternating machines, in which the Lowe process of type——

Q. Was that the process that was used in these various stations of the Consolidated Gas Company?

A. Yes, sir, that is, it is used in the stations except in the retort stations that I saw.

Q. I mean, of course, these three stations in which you have used the comparison. I do not mean the coal gas stations?

4839 A. Yes, sir. I have not visited the stations, but I had reliable information that that is the machine they use.

Q. Now answer the question.

A. I am perfectly well acquainted with the machine and have seen it in many localities. The operation is to blow up the heat in a generator containing coal and by the addition——

Q. I know, but what is there in that operation that produces the excessive tar?

A. Well, it is the variation in the heat, when the oil is first turned into the machine there is a higher heat, no matter how it is managed, and there is a tendency to make a little carbon.

Q. From what element does the tar come?

—. It comes from the oil. It is a product—it shows the non-decomposition of all the oil in the gas. The machines from time to time are known to kick, as it is called, that is, the passages get clogged up and work into channels and gases escape decomposition in that way and they frequently have to be cleaned out, and towards the end of their time of proper duty they refuse to decompose the oil into gas.

Q. Then does a large amount of tar show an inefficient operation of the plant?

A. Yes.

Mr. Mathewson: Well, whether it does or not depends on the accuracy of the facts which he has testified, it seems to me, and a conclusion that somebody else can draw.

The MASTER: I think he might be proprely asked if in his opinion it would necessarily show an inefficiency. I think I will take that.

Q. In your opinion does a large percentage of tar as is shown from the operation of these plants necessarily follow from an inefficient operation either of the plant itself or from the management of it?

4840 A. Assuming the statements in the paper to be correct, it shows a very poor average operation, I should call it.

Q. And in a large production of tar there is a waste of the oil, is there not?

A. Always considered a waste, only to the extent that you can use it afterwards. Now we have methods for separating and using some of it.

Q. Yes, I know, but do you get as valuable a result from distilling tar in your gas generators and selling the tar as you would in applying the same amount of oil to making gas?

A. Not by any means.

Q. Then it represents a distinct loss in operation, does it?

A. It is not a valuable tar for sale, that coal tar is sold at a very low price.

Q. (Question repeated).

A. Yes.

Cross-examination by Mr. MATHEWSON:

Q. The use of high pressure pipes to overcome the variation in pressure would not overcome the variation due to altitude, would it?

A. Partially, that is, it would overcome it entirely if you would separate it off in sections, that is put valves in and then feed from your high pressure mains into the mains along at the different levels, which could be readily done.

Q. You never figured out how many sections it would require in the City of New York, considering the different points of elevation here?

A. I would only think it necessary to put in comparatively few from what I have seen. The variation from Columbia College down to 125th Street is a tolerable variation, I don't think it shows over one-third to one-half of an inch.

Q. That is not the only elevation in the City of New York that requires special treatment, is it?

4841 A. No, I saw a greater elevation on Washington Heights, down to 125th Street.

Q. And there is a deep cut running through Washington Heights, below Kingsbridge, separating the high altitude of Fort George from the high altitude of Fort Washington, on the other side of the island?

A. I am not acquainted with that particular locality, I don't remember it. However, I should not think it was necessary to treat separately over a variation less than, say, 100 feet.

Q. Would not the pressure at every point where the high pressure mains were attached to the distributing mains have to be kept down to a pressure not exceeding two and one-half inches?

A. Yes, sir.

Q. The effect would be simply to increase the point at which an initial pressure of two and one-half inches in the distributing mains was established?

A. That is just it, that is what would be the difference.

Q. Now, you speak about a pressure of 20 pounds in pressure mains. Do you mean 20 pounds to the square inch?

A. Yes.

Q. What would be the effect of that pressure on the distributing mains to consumers' meters if a governor broke down or the pressure was let into the distributing mains?

A. Well, there would be, by properly locating the governor, there would not be much effect. You have the outlet to the holder, it would blow the holder up in the nearest locality and raise the holder—no, I doubt whether that would be a proper safeguard, because the holders here are weighed to such an extent, they would require to be counterbalanced in order to make that workable. That is not impossible, however; I have seen it done on holders. You would have to have free access to the holder, but I have seen the pressure let loose in a large main from a governor without increasing it very greatly. They could take the precaution also of having a small opening in the governor, so that in any possible arrangement of the governor there would be only a certain amount of gas go through anyhow. There could not be any excessive amount of gas. Also a governor can be made, and is made, which any breakdown will shut off at that point. 4842

Q. A midnight consumption and a maximum hour's consumption is very difficult. How could you arrange that?

A. How could I arrange that?

Q. Yes.

A. You are not obliged to pump as soon as your output is well within hand, but you could proceed without the use of the pressure main; a pressure main is only intended for the maximum demand.

Q. Is it not well known in the gas system that you have to bank up pressure so-called against the hours of heavy consumption in order to keep up with your consumption, and is it not true that if a consumption once gets away from you, you can hardly catch up with it?

A. Well, that is just it, bank it up. It banks it up more than an inch and a half, 15 pounds of a pressure is really a power to bank up, for all you want.

Q. And that pressure would be great enough to blow up a holder if it got into it, the holder being weighted as ordinarily, would it not?

A. Well, the only thing——

Q. Well, would it not? Just give me an answer direct for once, Mr. Edgerton.

Mr. Page: Do you mean that they would reverse the pump and put it into the holder instead of into the main?

Mr. Mathewson: No.

A. It would raise the holder in the same manner that the
4843 exhauster would raise it. It would be a matter of indifference whether the exhauster at the works was raising the holder or the pressure was raising it.

Q. The holder does not support any such pressure as 20 pounds to the inch?

A. Yes, it would support 200 pounds or any other pressure—that is not the holder itself but the main.

Q. I am talking about the holder. Would it not take the top off the holder?

A. No, sir, not by any means. There could not any such action happen as that if you tried.

Q. What about the effect of this in the distribution mains, with a pressure of 20 pounds, would it not blow the meters out?

A. It would blow the meters out if you had high pressure enough.

Q. Would not that be high enough pressure?

A. Yes, sir, it would if it got into the mains, but——

Q. If it did get into the mains and did blow the meters out it would be a pretty serious situation, would it not, in the houses?

A. It would be, if anything of the kind could happen.

Q. Do you know of any great city where such a system as that is in vogue with a 20 pound pressure?

A. Well, I don't know exactly the pressure they pump to, but I know that they have distribution of both natural gas and artificial gas which they lead into the mains by the use of governors.

Q. I am trying to get at something definite. Do you know of any great city where they operate under a pressure of twenty pounds to the square inch on illuminating gas?

A. I don't think it has been carried up to twenty—Oh, yes, it has been carried higher than twenty pounds on illuminating gas and water gas.

Q. Give us the name of a great city in which such a system is in operation; because it must have been discovered by some engineer, if it is practicable, perhaps.

4844 A. So far as—I have not visited the places, but I know it is in operation in a number of places.

Q. Give us the names of a few of these large cities. I want to get a large city where that is in operation.

A. How big do you want?

Q. Well, give us the largest one you know of.

A. Well, New Orleans feeds it from a pressure main pumping around the city. That had been described in some of the proceedings of some associations, I believe.

Q. What is the pressure per square inch at the opening from this feeding main to the distributing main in New Orleans?

A. I don't know.

Q. Well, you know it is not twenty pounds to the square inch, do you?

A. No, I think it is probably as much, if not more than that.

Q. You don't know?

A. They have a six-inch pipe, and to distribute any amount of gas through a six-inch pipe around the city would require more pressure, I should think, than I have been calculating on.

Q. Well, do you know?

A. No, I do not.

Q. And is it not true that a pressure of even less than twenty pounds to the square inch, if it got into the distributing mains and services would blow out the gas at the burner if it were lighted?

A. Yes, but it could not get in there.

Q. Won't you be good enough to answer my questions and not try to argue with me? I asked you if that pressure got into the distribution mains and services, would it not blow out any gas that was lighted at the burner?

A. If you got twenty pounds certainly.

Q. Well, that is the answer. Now, what other city besides New Orleans that is of any size where you can mention any such system as twenty pounds to the square inch pres-ure in vogue?

4845 A. Well, while I was examining into the natural gas question, they were pumping about 100,000,00 feet into Chicago, and I was informed that they had sixty-odd millions of distribution there through a pressure system reduced in this man-er by a governor.

Q. That is natural gas, is it?

A. Yes. All gases follow exactly the same law in regard to compression and in regard to blowing up meters.

Q. Tell us again about Chicago. I did not quite catch that. What is the arrangement in Chicago according to your information?

A. My information is that they feed into a relatively low pressure main, that is, a main where the pressure is measured in ounces instead of inches of water, the way we do, and they pump a distance of about 130 miles. I have seen on the record something like 168,000,000 a day.

Q. Is it your information that there is a pumping main in direct conjunction with the distributing mains in Chicago with a pressure equal to twenty pounds to the square inch at the point where it enters the distributing main?

A. No, it is nearly 300 pounds.

Q. At the point where it enters the distributing mains?

A. Not at the point of the mains, but where it is reduced.

Q. I am talking about the distributing main which may be reduced twenty-five or thirty miles out of Chicago?

A. Perhaps.

Q. I am talking about the pressure at the point where it enters the distributing mains. Do you mean to say that the pressure you think is twenty pounds to the square inch at the point where it enters the distributing main?

A. Not where it enters, but where it is governed.

Q. Well, at the governor, separating it from the distrib-
4846 uting main?

A. Yes, more than twenty pounds.

Q. Where is that governor?

A. I don't remember the location of the governor.

Q. Have you ever seen it?

A. Not that I know of.

Q. Is that illuminating gas or is that gas used for fuel?

A. It is used for fuel and runs through the low pressure pipes.

Q. Is it illuminating gas?

A. No.

Q. Do you know whether these cities of that character, that is which had natural gas, have cast iron meters instead of ordinary meters?

A. They have a high pressure meter because they use pressure by the ounces, whereas you use pressure in the ordinary distributing mains by inchs.

Q. They have iron meters?

A. Yes.

Q. Now, you say that you would put one main up each side of the City of New York. Up what avenue would you run it?

A. I would run it along the water front as near the gas holder as it conveniently could be.

Q. Well, which ones? You are familiar with conditions here apparently?

A. I have not picked out the precise avenue and location for these mains. That is a subject I have not entered into. I know they will have space enough to do it.

Q. You think it would be a good thing to run it up along West Street, where the main would be generally on the level with the water, and on made ground?

A. I would not use such a locality now.

Q. If you come up on that route, do you think there is room enough in Broadway to run another large main on that street?

A. I would not propose to run it up Broadway or the central district at all.

Q. I thought you said you would run through the congested districts. Now, I want to know what avenue?

4847 A. I mean parallel with the congested districts so as to feed up as nearly into the cross-town mains as possible.

Q. You have not gone so far as to determine which avenue you would run this on?

A. No, sir.

Q. And you have not examined these avenues, to ascertain whether there is room to put high pressure mains of large diameter up those avenues, have you?

A. While looking around on the mains question I saw room enough to put more than 24-inch main in various localities. I didn't note any great congestion of mains.

Q. In the City of New York you did not notice any great congestion of mains?

A. Nothing that I considered insuperable to laying another pipe.

Q. You do not think the mains in New York are very much congested then, in the streets?

A. Not so much as they are in some of the natural gas districts where they are supplied with natural as well as artificial gas.

Q. What sort of a main would you put in, wrought or cast iron, for your main?

A. Wrought iron.

Q. What did you mean when you said that the capital investment for 1,000 feet, if 15 pounds pressure was used, would be less the cost of delivering it under the pressures now used?

A. I mean that the capacity under an increased pressure would be increased five times by using a little pumping during the congested hours, during the hours of greatest demand.

Q. But when you got in into the distributing mains, if you got the pressure between 2½ and one inch there, you would not distribute any more gas through that, would you, than if you kept the pressure in the distributing mains 2½ to one inch, without any intermediate mains? In other words, the amount of gas that
4848 you would deliver from your distributing mains, assuming the same number of services in operation, and the same number of burners, would be exactly the same, whatever produced the pressure in the distributing mains, wouldn't it?

A. Yes.

Q. In fact, your theory is, you would distribute more gas if the pressure was higher and came direct from the holder to the distributing mains?

A. No, that is not the idea at all. I mean to say that it would not increase the cost of the present main system, but would deliver an extra quality of gas or the increase at one-fifth the capital expense that would be required to go on under the present system, to meet the increased demand.

Q. At one-fifth the capital expense applied where?

A. Applied to new mains. That is, as the demand for gas increases your mains would have to be increased to meet it, and it would be about one-fifth the expense.

Q. You mean for future consumption?

A. For future and present. It would make it more equitable. I do not say it would make it cheaper for the present output, but it would make it more reasonable.

Q. But you would use the mains now in operation and put in other mains. That would mean a larger capital investment, wouldn't it?

A. For the price of main, yes, sir.

Q. Did you figure on wrought iron mains in your reply to which I have just called attention?

A. Yes; that is, the wrought iron mains would be a little less expensive than the cast iron mains and the wrought iron main would be much thinner than the cast iron main.

4849 Q. Have you ever operated a high pressure system of the kind you suggest in any great city in the East?

A. No, sir.

Q. So that your views are not based on your own experience in that regard in such a city?

A. Not in a large city.

Q. And don't you know that where these high pressure systems are used as a rule they are in small places?

A. Everything of that kind has to begin in small places.

Q. Now, let us take the question of candle power. Refer to State's Exhibit HHHH. You understand, don't you, that for the first six months, January to June inclusive, the city inspector made tests but once a week, that is to say, about four tests in each month?

A. Yes.

Q. You understand that, don't you?

A. I understand that.

Q. Now, what about the candle power of the Company corrected that you have stated to be for January, for instance, 25.14, 21st Street station; was that average obtained by taking four candle power readings made by the Company in the month, or by taking 30 candle power readings and averaging the whole 31?

A. I don't remember whether the full number of observations were taken a month, but I suppose thorough observations were taken, as they ought to be, by the inspector.

Mr. Mathewson: I move to strike out, "as they ought to be by the inspector."

Motion granted.

Q. Now you said that you made up that portion of the exhibit, Schedule 3 of the accountant's report, for Mr. Hall, didn't you?

A. That is, I supervised the starting out, directed the young man what to do.

4850 Q. Do you mean to tell me that you don't know whether this 25.14, January, for the 21st Street station, represents the average candle power of thirty-one days or of four days?

A. Well, I know that it does not represent four. Once in a while an observation might be missed. I looked over the candle power columns very carefully but whether an observation had been left out or not I don't remember.

Q. Do you know what hours the Company made the observations which were averaged at 25.14 candles?

A. I do not.

Q. Do you know at what hour the City Inspector made his inspections, four or five of them, which averaged 21.24 for January?

A. No, sir. My directions were to take at the time of the greatest output of gas.

Q. Now, if the days on which the City Inspector happened to make his four or five inspections the candle power of the gas happened to be lower than normal, there would be no fair comparison between a candle power at the Company's works which was taken by the average of every day in the month, and the average of the City Inspector which happened to be taken on those four or five days, would there? Do you think that is a scientific comparison at all?

A. The best I had. I do not approve of making observations once a week.

Q. That is all right, but do you consider that a scientific and fair comparison where you do not know how many days the City Inspector's 21.24 represents and you do not know the hour of the day when the observations were taken and you don't know whether those tests were fair average days for the month or not?

Mr. PAGE: Objected to as including more elements than he said. I have not asked him anything about the City Inspector.

4851 A. I did not predicate very much on the City Inspector's report on those early days. I do not believe I even referred to them.

Q. Yes, you do. You show the loss in the last column between correct candle power and city's candle power and testify as to the difference in the loss in one case or another as though it might be due to the character of the oil instead of due to the particular days on which the inspector happened to inspect?

A. No, I don't remember, only on April or May I think I ran down toward the daily inspections.

Q. And you did find that in April with an average gravity of oil of 33.80 the loss according to this unscientific method was 3.38 candles between corrected candle power of the company and the City Inspector, didn't you?

A. That is put down here, yes, sir.

Q. Do you know whether the City Inspector corrected for temperature or not?

A. Yes; it so states on his inspection.

Q. Does it state that he corrected for temperature prior to July, 1905?

A. I think they are stated here. Corrected and sworn to.

Q. You found by this method that with the lower gravity oil 29.53 used in May the loss was 5.09 as against 3.38 candles the previous month when a higher grade of oil was used, didn't you?

A. Yes, sir.

Q. You stated that the results were not entirely consistent, did you not?

A. I did.

Q. You would not expect them to be consistent, would you, unless you knew what days the City Inspector examined upon and took the observations of the company on the same days at the same hours at its works?

A. It does not require the same hours exactly. I think the observations ought to be taken when the current of gas is going out for lighting.

4852 Q. At substantially the same time in order to make a comparison and show loss of candle power between the works and testing station?

A. Not exactly the same time.

Q. I asked as to the same time. Oughtn't it be?

A. That is assuming the gas in the holder is a very different quality. I do not think it is necessary to be very particular about that. The nearer they are together the better, but then you have got to allow for the time, and distribution and all that kind of business could not be allowed for. The gas is about an average.

Q. The gas is going into the holder every day?

A. All the time.

Q. And don't you know that you cannot make a comparison which will show loss of candle power between the works or between the holder and the inspecting station with any scientific accuracy without testing at substantially the same time at the works or holder and at the testing station?

A. Well, it would be better to do it in that way.

Q. Don't you know that it frequently occurred in testings prior to the new law that the average of the city inspector who examined only four times a month would be found to be higher than the average of the company which examined every day in the month, due to the fact that the inspector happened to make the test when the average was high, and not the average test, or didn't you know that?

A. I didn't know that, but I didn't put any great weight on those first observations.

Q. Now, let us go down to the 44th Street station. You say that according to this method of comparison which you have taken, there seems to be in November a slight difference of .22 of a candle power between the average of the company at the works and the city inspector. You know the contract for the higher grade 4853 oil went into effect November 1, 1905, don't you? You remember that is the date of the contract?

A. I heard it so stated, yes, sir.

Q. You observe that in November when this small difference occurred, the average gravity of the oil, according to you was 34.25, while in October, a month before, it was 29.95, and the loss in candle power was 2.42?

A. Yes.

Q. And considering the fact, referring to December, at the 44th Street station, that the tests may have been taken at different hours by the company at the works, than the hours of the city inspector's tests, and that there was certain gas in the holder at that time which may have been made the day before, isn't it quite possible that there might have been a difference of .05 of one candle power without much difficulty?

A. I could not understand that. Any difference in the hours could not make any such anomaly as shown there.

Q. And referring to the 99th Street station, do you not observe that November and December there by the corrected candle power of the company and the city inspector's averages differed but very little, .12 of one candle power in one case and .09 in another?

A. Yes, plus. The city inspector showed a higher candle power than the gas at the station.

Q. Did I understand you to say that you have used 28 degree oil in preference to 34 degree oil to make a high candle power gas?

A. Yes, sir. I have used a heavier oil to a certain extent. I do not think there is any doubt but a heavier oil will make a higher candle power gas.

Q. Have you ever operated a low water gas plant in this section?

A. I have not operated a plant. I have been in close connection with them for days and weeks together.

Q. You said that if tar was left that wouldn't be so valuable. There is more carbon in tar, isn't there than in ordinary 4854 gas oil?

A. There is more carbon in it, yes.

Q. You said that the illumination depended, didn't you, on the amount of carbon in oil?

A. It does depend on the amount of carbon, but it has got to have sufficient hydrogen to float it.

Q. Then it depends on the hydro-carbon rather than the carbon, to be technically exact?

A. I spoke of carbonization matter as the source of the light, and always has been spoken of as such.

Q. Didn't you speak of the hydro-carbon as the source of the illumination ordinarily in the art?

A. I will say the illuminants, but the carbon itself really is the source of the light, the heating part of the carbon, and it depends on the amount of decomposed hydro-carbon.

Q. But there is no carbon in the oil, is there?

A. Combined.

Q. That is hydro-carbon in the oil?

A. Combined with the hydrogen.

Q. That is the hydro-carbon, isn't it?

A. Certainly. I never heard it stated any other way than carbon. Hydro-carbon is the chemical composition but the carbon is the source of light. I spoke of it as the source of light.

Q. Does the weather have any effect on the illuminating power of the gas and the efficiency of 34 degree oil as compared with 28 degree oil?

Mr. Page: Will you divide your question?

Mr. Mathewson: Let the witness divide it.

A. Do you mean whether it would stand cold weather any better than—the light oil would stand cold weather any better than the 28? I don't understand it, if that is what you mean?

Q. Yes.

A. I have not seen any practical difference, no.

4855 Q. And you think that no matter how cold the weather is that the 28 degree oil is just as efficient in producing a fixed gas to maintain its candle power under those conditions of temperature as a 34 degree oil, do you?

A. I think, if properly decomposed into fixed gas it would be just as well.

Q. With low apparatus?

A. With low or any other apparatus.

Q. Well, do you mean with low apparatus?

A. Yes.

Q. You consider then that the oil is better for gas making purposes simply because it contains a greater proportion of carbon, do you?

A. Combined carbon. That is, it has the hydrogen to carry it into a gaseous state. Understand the distinction I make between the carbon and hydro-carbon is simply that the light is due to the carbon entirely and not to the hydrogen. The heating part of the carbon particles when the gas is decomposed by heat.

Q. You know, do you not, that the Consolidated employs certain of its tar deposits for fuel in lieu of coal?

A. Yes, they all do that. I think at Danbury we were the first to separate tar so as to use it successfully in the boiler.

Q. Do you mean to say at Danbury there was only about 10 per cent. of tar drip?

A. Less than that.

Q. What became of that? Did you use that?

A. We used that for firing the boilers.

Q. Didn't you have your tar run into the river at Danbury?

A. It did at one time. We had a small portion, simply a portion that was carried off owing to the fact that cold water and the tar is hard to separate, but by heating it up with a provision they have now the tar and water separate so that now it runs off.

4856 Q. Wasn't Captain McKay called in an consulting engineer on the elimination of the trouble from the tar running into the river, and installing a system of purification and so forth in Danbury?

A. I never heard of his advising to tar at all. It has been talked over for a number of years by myself and the superintendent, but there was so small an amount manufactured that when a lawsuit came up compelling them to act they acted.

Q. Captain McKay was called in, wasn't he?

A. I don't remember that he was. I wasn't there.

Q. You met him in Danbury, didn't you?

A. I met him in Danbury in regard to this price matter, yes.

Q. And soon after that the trouble from tar running into the river was eliminated?

A. Oh, that was years ago.

Q. Hasn't he been consulting there for five years or more?

A. Not that I know of. I know that Mr. Merritt would consult with Mr. Addicks or anybody else he can talk to on the question of gas.

Q. Did you ever meet Captain McKay more than once?

A. I never met him but once.

Q. Did you ever discuss any engineering matters in reference to Danbury with him, or he with you?

A. I remember one time he was around there trying to "raise hell" about the price.

Q. You didn't know he was employed by the company to "raise hell," if you put it that way, did you, instead of their relying upon your advice?

A. The exact information in regard to the matter is this, that for a long series of years since 1892, the superintendent of Danbury and myself have been arguing and urging a decreased price to the small consumer. There was a large difference in the price of gas for large and small consumers and it had got to be out of proportion.

4857 Q. I am asking about Captain McKay and the tar running into the river, and his position as consulting engineer and in conferring with you. I do not care about anything else.

Mr. Page: I think your question was broader than that. You asked if this man had been called in as consulting engineer generally for some time past.

Mr. Mathewson: Well, let him answer that but we do not want a treatise on the subject.

A. It is a very short story, if you will let me tell it.

Q. I asked if he has not been called in as consulting engineer on one case or another for the past five years and been paid for it?

A. I never heard of him being called in until he came down and advocated a reduction of price and then turned up a few days afterwards, and said it would be better to reduce the quality at the meter. That is his way of reducing cost to the consumer.

Q. That is your answer, is it, to the proposition that you were not consulted by Captain McKay in reference to these engineering matters regarding which he was brought in?

A. I never consulted with him; never knew, in fact, he had been consulted. I know that the plan of purifying the gas with iron as adopted in Danbury was exactly after my plan.

Q. Are you a part owner of the Danbury company?

A. No, I haven't a cent of stock in the Danbury company.

Q. Don't you know that Captain McKay has been employed and has been paid repeatedly within the last five years to advise them as an engineer with reference to the plant?

4858 A. If it has been done, the superintendent didn't know anything about it, nor anyone but the president, and I don't think any director knew about it. I know this, that Mr. Merritt, the president, talks gas with Mr. Higgins or with you or Mr. Addicks. Anybody that turns up, he confers with on gas matters.

Q. Are you in receipt of compensation from the Danbury Company now as consulting engineer?

A. No, sir; I never did. What I put in there, except to produce a gas plant, I gave them and give them a proper steer and now they have got it so that I reckon that it will turn out as it did in New Orleans.

Redirect examination by Mr. Page:

Q. Mr. Mathewson asked you if the pressure of 20 lbs. in the main would not blow up the gas holder. Was it your idea——

Mr. Mathewson: I didn't ask him any such question, Senator.

Q. Was it your idea that the gas would be pumped away from a holder or toward the holder?

A. Pumped away from the holder.

Q. Then to get into the holder, it would have to go back through the pump, wouldn't it?

A. It might go back into some of the other holders, but it would be a relief to the gas if the pressure on the holder was not too great or if the governor or holder did not interpose. However, there are half a dozen mechanical devices, that could provide for an outlet from the excessive pressure of the gas, back into the holder by passing the governor. We have that appliance in nearly all our exhausters, with the exhauster pumps, to pass without producing too great a pressure on the holder side; we have a by-passage that 4859 lets it go around and back again. The same mechanical appliance could be used in this case. I do not think it would ever be necessary, but if any one was nervous enough to choose to employ it they could do so.

Q. And he says if this tremendous pressure gets into the services and meters, that it would blow them up. Now are there mechanical devices for taking care of that.

A. Yes, sir. There are thousands and thousands of customers using gas under pressure where they have individual pressure reducers. I did not approve of them at the outset, but they have been used safely for such a period of time that——

Q. And this high pressure service is used very largely to transmit gas to suburban districts, is it not, in the City of Chicago now?

A. Yes, sir. It has been used by the Pintsch system, and by various systems. I employed it at Asheville to pump gas from the works to the holder in the city about three miles, through a two-inch pipe. The whole supply depends on that.

Q. Now, these high pressure mains would not connect directly with the services?

A. Not at all. They are distinct from the services and even from the mains. They are absolutely a valve, a valve in between the high pressure main and the large mains into which to deliver, an absolute valve there that stops off the pressure and it is only opened when the pressure goes down in the large main.

Q. I understand there are governors so made that if any accident happens it shuts the valve and closes the——

A. Yes, the governor is made so that upon any accident that could possibly happen the governor drops and shuts off the gas supply at that point.

Q. Then these various difficulties that Mr. Mathewson suggested had been foreseen and been provided for by mechanical devices, had they?

A. Yes, sir.

Q. In these very systems?

A. Yes, and operated for years.

4860 Q. Now have you not in this paper, State's Exhibit HHH, set down the observation of one day as against the observation of another day. Have you? You have taken the average of the month?

A. It is the average of the month and the average of the year and therefore it cuts up all variations to the extent of the number of observations.

By Mr. Mathewson:

Q. Did I understand that if you divided the City into districts you would supply gas to some districts only from a high pressure main or a supply main?

A. I would supply through the high pressure system, pumping as long as there was congestion, as long as there was a demand for gas or fall of pressure, but as soon as that was relieved and the gas flowed slowly there would not be any need of any pumping.

Q. Yes, I understand, but you would send the supply there to that district through one of the high pressure mains?

A. No, not necessarily at all. The low pressure main could carry it. It would not involve the disuse of the present low pressure mains there. It would be just simply having an independent supply to the districts where there was a large demand.

Q. Didn't I understand that the low pressure mains would be shut off from each other in these districts. They would have to be, wouldn't they?

A. Only on districts where there was a large difference in the elevation, and even in that case the district governor at that point could take care of it during the low pressure time.

At 4.45 P. M. adjourned to Monday, December 10, 1906, at 10.30 A. M.

Last Exhibits:

Complainant's, 257.
State's, HHH.
City's, 122.

4861 Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,
vs.
JULIUS M. MAYER, as Attorney General of the State of New York; WILLIAM TRAVERS JEROME, as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIAN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and THE CITY OF NEW YORK, Defendants.

Before Arthur H. Masten, Special Master.

NEW YORK, *December* 10, 1906.

Met pursuant to adjournment.

Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Page, Mr. Kirby.

4862 MR. BURR: I noticed, Mr. Master, that on page 4269 the full number of pages to which I referred in the case of The People of the State of New York *ex rel.* Consolidated Gas Company, respondent, against the State Board of Tax Commissioners, appellant, as the same appears in the cases in the Court of Appeals, Special Franchise Tax Cases, Volume XXI-XXVII, July, 1902-July, 1903, in the *Law Institute,* it stops short at page 49 and does not include the pages as marked 55, 56 and 57, which I asked to be added:

"A. The appraisement referred to consisted of elaborate statements made by experts as to each constituent company, of the tangible property of each company, in great detail, giving the value as to each, of every main, meter, service, all plant, machinery, furniture, offices and whatever tangible property there may have been; these all together aggregated $27,649,060, as before stated; they contained no references to or appraisement of the franchises, or business or contracts, or good-will of the constituent companies; there were also valuable patents, which were not mentioned or valued in the appraisement; the Consolidated Company, in 1884, issued $35,430,060 of its stock to purchase all of said tangible property, and all of the franchises, business, contracts, patents and good-will of the constituent companies; the difference between the above amounts, namely, $7,781,000 was considered to represent, at that time, the franchises, and business, and contracts, and patents, and good-will—everything, in fact, except the tangible property; the word "franchises" was used (but not in the inventories as a general word 4863 to cover the whole, for which the $7,781,000 of new stock was issued, and not as representing any particular franchises as the word is being used to-day.

"Q. Please state by whom this appraisement was made, and, if you know, the purpose in stating the value of the franchise?

"Objected to as incompetent, immaterial and irrelevant. Objection overruled; exception.

"A. There was no appraisement of franchises, as I have already stated; the appraisement of the tangible property was made by several different experts in that line—builders of gas works, machinery, etc.; I cannot remember who all of the persons were; one of them was an officer of the Continental Iron Works.

"Q. Is any mention made in that document of the good-will of the companies, or of the right to exist as a corporation, or of contracts with the City, or of the right to make and sell gas?

"Objected to as incompetent, immaterial and irrelevant. Objection overruled; exception.

"A. No; because no appraisement of those matters was made—the appraisement was made only of the tangible property."

Mr. Mathewson: In going over the testimony of last Saturday hastily, I observe on page 4846 one question which reads: "I am talking about the control of the output when it goes to the consumer." The question should be: "I am talking about the control of the output so far as it concerns the consumer," instead of "when it goes to the consumer." I would like to have that corrected.

4864 Henry H. Edgerton resumed.

The Witness: I stated the selling price of coke at Butte at $9 by the gas company. That was coke bought, Connellsville coke, for water gas trials, and their own gas coke they sold at $7.35, which is about $2.35 a ton more than the best coal in Butte at that time. I also want to correct a statement in regard to the meter at 14th Street station being made by Gratz. It should be at the 42d Street station. I found in looking over my 42d Street inventory that the Gratz meter was located there.

Q. On page 4746, Mr. Edgerton, you said: "I saide the price of it at Butte from $6 to $7.35."

A. That involved selling it in measure instead of weighing——

Q. Well, that is all right; we have that correction made now. Of course you will have an opportunity to read over your testimony and make any typographical corrections and so forth. Now, Mr. Edgerton, you were asked by Mr. Mathewson whether you could give the elements of cost price of gas at 24 cents in the holder. Have you made that computation?

A. Yes, sir.

Q. Will you state it?

A. It amounts, in adding up the details, to 23.26 cents, in case of making a certain percentage of coal gas and water gas.

Q. What is the percentage of coal gas and water gas?

A. That would be leaving out nearly all of the water gas. I have not calculated the percentages, but it seems practically an enriched coal gas. And there is another calculation based on the Central Union results, which I brought to 22.92 cents.

Q. Now you state the first computation is of an enriched coal gas. You may state exactly what you mean by that.

4865 A. The basis of the gas, that is, it is almost entirely composed of 14 candle power coal gas, and to that we add oil gas enough to restore the candle power to above 22 candles and enough water gas to carry the oil vapor through the super-heater. I heard it proposed on very good authority by an eminent engineer that the oil gas could be made in the Lowe machine without any water gas to carry it through, by simply flooding the machine with oil when it was hot and using an excessive amount of oil to make up for leaving out the water gas, but I have my doubts about such an operation, and I have added a percentage of water gas in order to carry it through.

Q. You may give the details of that computation of 23.26 cents.

A. That involves bituminous coal at $3.20 a ton and a yield of 10,600 cubic feet to the short ton of 2,000 pounds. The other elements are the marketing of the coke at $4 per ton and——

Q. Give your amounts there as you have them. Do not skip around.

A. I did not think you wanted all the details.

Q. Yes, give us the details.

A. The cost of coal unloading, charging, drawing and yarding and quenching and labor of gas making and purifying I have at 36.12 cents. Superintendence at ½ cent. Coke and breeze made, 66 per cent. of the total weight of coal, or 1,320 pounds per ton of coal used. I used for fuel for the manufacture of the gas 20 per cent. of the coke made. The return from residuals I put at: Coke, 19.8 cents per thousand cubic feet; tar, 12 gallons at 5.65 cents; ammonia return, 4.7 cents, being altogether 30.16 for residuals per thousand. I see the Central Union has 29.06 cents. This gas will be about 14-

candle power. Enriched with oil gas to 22-candle power, taking oil
at 4.23, generator coal at 20 pounds per thousand, labor of making
oil and water gas three cents per thousand. Repairs to appa-
4866 ratus, buildings, 4.5; purifying material, lime, .75 cents;
oxide, .25 cents; oil and waste, .37 cents; water, .17; general
expense at works, half a cent; repairs to oil gas apparatus, 2 cents
per thousand, half a cent, making 23.26.

Q. On the basis of 10,000,000,000 cubic feet of yield, what would you say of half a cent allowance for superintendence?

A. Well, while I was making these figures I did not take the enormous output into consideration. I was figuring more on the smaller output which they have at the Central Union. That figure for superintendence would be rather excessive on the total output; it would be something like $50,000, I think, on the total output of the Consolidated.

Q. And 4½ cents for repairs on the same basis would be somewhat in excess of the experience of the Consolidated Gas Company, even?

A. I think it would, although in running new machinery and gaiting it up, and getting everything in order, it would possibly run up to that while it was in a state of experimental—not exactly an experimental stage, but gaiting and getting in first-class running order. I state this because I recommended the use of sloping retorts and inclined retorts at Lynn, and for the first year there was some disappointment about the results, but after getting everything in shape and getting the men accustomed to the handling it turned out very nicely.

Q. After you get your apparatus gaited, an allowance of that much would be somewhat excessive, would it not?

A. Yes, the repair of apparatus and buildings; it would be more even than the old-fashioned coal gas methods, but would amount in the——

Q. So that you have a margin in those two figures, do you, in
superintendence and of repairs, quite a large margin?
4867 A. It seems so on the output of the Consolidated.

Q. That is for a plant which would produce 10,000,000,000
feet?

A. Yes, on the output of 10,000,000,000 feet, it would be $450,000 a year for repairs at works?

Q. And what was the experience of the Consolidated?

A. I think their repairs on their present works come to about $297,000 at the works, on the repairs of buildings and labor and material.

Mr. Mathewson: Where does he get that $297,000? Is that from any of these exhibits or accounts?

The Witness: I got it from the account made up by the gas company that you were looking for the other day to verify.

Mr. Mathewson: Do you mean the statement of operations for the year 1905?

The Witness: Yes, sir. I simply added up the station repairs.

Q. Of the different stations as shown on——

A. On pages 13, 14, 15, 16 and 17, the five stations.

Mr. PAGE: State's Exhibit ZZ, for identification.

Q. You may state why you took coke at $4.00 a ton?

A. I have found that coke is not a bad generator fuel. My first experience in that direction was to provide the New Orleans Water Gas Plant with coke. Then I sent Alabama coke to Danbury and had put it through a test, and I have found there that although it was more bulky than the coal, that it gave very excellent results; and, furthermore, I found that coke had been used through-
4868 out the West for generation of the water gas or blue gas portion of the product, and also in Massachusetts; in fact, wherever they had an excess of coke. Lynn got along with 32.8 pounds generative fuel; Cambridge, 31.8; Worcester, making due allowance for the portion used of hard coal, 35. All those figures compare very favorably, pound for pound, with the use of anthracite.

By Mr. MATHEWSON:

Q. Do you get those figures that you are now giving from the Massachusetts report to the Gas Commission?

A. Yes, sir.

Q. On what year?

A. This is the twenty-first Annual Report.

Q. The last printed report?

A. I think it is the last one. It might have been from the twentieth Annual Report.

By Mr. PAGE:

Q. Proceed. You say it compares favorably. Have you got any figures of plants that have used anthracite?

A. Yes. We have right in the same tabulation: Fall River shows the best results at 32.2 anthracite, and the next is based at 34.6 anthracite. Of course, the smaller plants used more. These, using coke or coal, I quoted the best results from the use of both fuels used in large plants.

Q. What deduction do you make from that?

A. I make the deduction that until the market could be worked up for coke among the multitude of small consumers that coke could be used to a very considerable extent in making water gas.

Q. And that would be a saving to the company on what?

A. On the present selling price of coke of nearly a dollar a ton.

Q. What about their anthracite?

4869 A. And it would save on anthracite 23 cents a ton, for the anthracite is put in the account, I believe, at $4.23 a ton.

Q. Therefore, from the use of this coke in the generating apparatus they would save the $4.23 on anthracite, and for that reason you have given us a value of $4.00; is that as I understand your testimony?

A. Yes; I found $4.00 would be saved, seeing it displaces anthracite, pound for pound. The use of coke in the generator is detrimental in some respects, and in some respects advantageous. It is a lighter fuel, and therefore it is more bulky, but, on the other hand, the porosity of the coke aids to a certain extent in decomposing the steam. The only precaution necessary being it shan't be overcharged with duty; that is, that it should be run at a slightly lower rate.

Q. Now, you may proceed to the other computation you made, and describe what it is, and your method of arriving at the price.

A. The computation based on the Central Union results is the make, one-half of water gas of 28 candles and one-half of 16 candle coal gas, in this case.

Q. Enriching the coal gas with the 28 candle water gas?

A. Yes, sir.

Q. Well, proceed.

A. In detail?

Q. Yes; we want to get it on the record.

A. Water gas 5½ gallons of oil at 4.23 cents, 23.2 cents; coke or coal at $4.20 per ton, 2½ cents; labor of gas making and coal handling, 3 cents; labor of purifying material, lime, .75 cents; oxide, .25; repairs to apparatus and buildings 2 cents; the water gas part that means; general expense at the works, .7 of a cent; superintendence, 5. The coal gas net as before——

4870 By Mr. Mathewson:

Q. Is this the water gas?

A. Yes, that amounts to 31.7 cents. The coal gas net as before, 6½ cents.

Repairs to apparatus and buildings, coal gas——

Q. I do not think I understand you.

A. That is on the coal gas after deducting residuals, 6½ cents.
Repairs to apparatus and buildings, 4½ cents.
Purifying materials, lime and oxide together, 1 cent.
Oil and waste, .37.
Water, .17.
General Expense at the works, .5.
Making, 12.94.
That is the coal gas. And the cost of the combined gas, 22.32, to which I add the difference in oil between 4 cents and 4.23 cents, which is .6 of a cent, making altogether 22.92. You see, I took this figure of oil from the Central Union price, which was 4.04, but I see I have made the correction above in the price of oil. In fact, corrected it twice.

By Mr. Page:

Q. So this last .6 of a cent should be deducted?

A. Should be deducted.

Q. Making the cost what?

A. 22.32 cents.

Q. I notice you have carried the same price of superintendence and repairs to coal apparatus as you did in the former. Would your answer be the same, that is, as to a plant producing the 10,000,000,000 capacity, that that would be excessive?

A. Yes, concentrated as the works would naturally be to combine the operations, I think that allowance for superintendence would be excessive.

Q. And as to repairs?

A. Repairs also probably would be less.

Q. Well, it would be less to the same extent that it was in your other computation?

4871 A. Certainly. I think I have made a rather excessive allowance there for repairs.

Q. I noticed that you used both lime and oxide purification. Why is that?

A. The oxide purification takes out only the sulphureted hydrogen, and the lime will take out the carbonic acid as well as the sulphureted hydrogen, thereby adding to the illuminating power of the gas nearly one candle for every per cent. of carbonic acid taken out. I allow for this for the reason that I think ultimately that this plan of operation will be carried out.

Q. I understand that each per cent. of carbonic acid in gas reduces the luminosity by one candle?

A. Yes, sir, that is my result. I have seen results from other experiments making slight difference, slightly less than that; but my tests show that with this per cent. of carbonic acid in the gas that the amount of illuminating power is less, with a flat flame burner.

Mr. Page: This is in response to a question asked on your former cross-examination, Mr. Mathewson. Would you care to cross-examine him on that, or shall I go ahead with some other subject?

Mr. Mathewson: I think I should rather have you finish with the witness if you can, Senator.

Mr. Page: Certainly.

Q. Have you made any computation as to the quality of the Central Union gas to find its candle power for the year ending October 31st, 1905?

A. I made such a computation as is often made by gas men; that is, taking the quality of coal gas at 14 candles and taking the quality of the water gas as based upon the amount of oil used, and
I find that the mixture of Central Union gas would give 23.1
4872 candles; that is, based on the 670,000,000 of coal gas at 14
candles, and 925,892,000 of water gas at 5.05 gallons of oil.
Adding those candle powers together, I find——

Q. Wait a minute. The 925,892,000 of water gas at 5.05 gallons would give what results?

A. 25¼ water gas; and the average of the two would be for the two 23.1, as near as it can be calculated.

Q. Now, Mr. Edgerton, have you made a computation as to the efficiency of the 42nd Street plant, as compared with the results of the other stations of the Consolidated?

A. Yes, sir. The gas in the holder at the 42nd Street plant as given in Exhibit ZZ for identification is 34.96 cents, and the average cost of 21st, 44th and 99th Streets, at 31.05 cents, leaving a difference in favor of water gas of 3.91 cents. That difference in the output of the 42nd Street plant amounts to $48,454.47, which capitalized at 5 per cent. gives $969,089.

Q. That is the theory of depreciation for lack of efficiency, the details of which you gave in regard to the 42nd Street plant?

A. Yes, sir. That is, those plants lagged behind in efficiency to that extent.

Q. And to that extent an intending purchaser would be getting a plant that would cost to reproduce gas $48,454.47 more than the other plants of the Consolidated operating in the same city?

A. Yes, sir.

Q. That loss you capitalized at 5 per cent.?

A. Yes, sir.

Q. Now, have you made a similar computation in regard to the 21st, 44th and 99th Street plants as compared with any other companies in the city of New York?

A. I made a computation comparing those plants with the results at the New Amsterdam, taking the results of Consolidated as 31.05 and the New Amsterdam at 28.06.

4873 Mr. Mathewson: I think the witness ought to state where he gets this 28.06, because I do not think it is in evidence. I suppose he has not examined the books.

Q. First, is the New Amsterdam a water gas plant solely?

A. I so understand; it is so shown in the accounts of the testimony before the Commission.

Q. In the New Amsterdam case?

A. In the New Amsterdam case.

Q. You have examined the record in that case, have you?

A. I examined the account, made up by the State's accountants, said to be drawn from that report.

Mr. Page: It could not be made up by the State's accountant.

The Witness: The cost of the gas, Consolidated Water Gas plant, averaged 31.05, and for the New Amsterdam, 29.01.

Q. That figure you get from Exhibit 336 in the New Amsterdam record before the State Gas Commission, printed on Appeal pages 573, 574?

A. Yes, sir.

Q. Now you may proceed with the computation based upon that basis.

A. The difference in the cost is 2.04 in favor of the New Amsterdam, and multiplied into the output at the Consolidated makes $161,724.24 and that——

Q. Is that the entire Consolidated?

A. The three water gas plants of the Consolidated. It is 5 per cent. on the sum of $3,234,484.

Q. Have you finished your computation?

A. Yes, sir.

4874 Mr. Page: We offer in evidence this exhibit 36 before the State Gas Commission, printed in the book on appeal, pages 573 and 574, down to and including the first total on page 574.

Received in evidence and marked State's Exhibit I.I.I.

Q. Referring to State's Exhibit I.I.I., will you state as to the percentage of tar produced by the New Amsterdam operation as compared with the percentage of tar produced by the Consolidated?

A. It would be 11.4 per cent.

By Mr. MATHEWSON:

Q. On what, or of what?

A. Of the oil used.

By Mr. PAGE:

Q. As against what percentage of the Consolidated plants?

A. 20.81 per cent. of the 21st Street, 24.7 per cent. of the 44th Street; 25.3 per cent. of the 99th Street.

Q. Did you make an examination of the 42nd Street plant of the Consolidated Gas Company?

A. Yes, sir.

Q. When did you make that examination?

A. I don't remember exactly what days now.

Q. Since making that examination have you had an opportunity to compute or to make the necessary computations?

A. No, I checked off the items as given here as to sizes of quite a number of apparatus they never allowed us to measure, and I have not had an opportunity to go into that at all in regard to checking off and as to the quantities. I only had an opportunity to——

Q. And the reason being you have been almost continuously on the stand since then?

A. Well, more, too, figuring up, and engaged in figuring up various data and looking for information we required in the 4875 case. I really had no time to go over this—I can say however in regard to that portion of 42nd Street which includes the dock and all the woodwork that——

Q. What do you mean by all the woodwork?

A. The woodwork is the trestle which carry the coal handling apparatus, it is very dilapidated indeed; in fact, it is in a condition which would require renewal at no very distant period. I should think the depreciation on that woodwork that is exposed to the weather that I saw there was fully 60 per cent. of its value. In fact, it would require an absolute renewal within a very limited period of time throughout. Also the handling of the coal along that dock is an expensive carriage. It is all done by men pushing carts and heavy wheelbarrows. The usual economy in practice in coal handling is by making the coal carry its own weight down an incline. This is neglected at that point and men have to be employed to push it. I have put in apparatus similar in which the loaded car of coal down a slight incline would carry the empty car back, and it is a very long trestle work and I suppose there are really more men employed there in pushing the coal and handling it in that way than in the other portions of the works. That is corroborated by the yield of gas per man at the works. Otherwise the works are in better shape than the 14th Street station, as they have full depth regenerative furnaces, double stage charging, and I should suppose it would make quite superior results in regard to the output of gas per retort and per man were it not for the charges due to handling the coal.

Q. The criticism which you have made upon the question of coal handling, I understand is in the schedule under the head of "Buildings, Coal Sheds and Runway Overhead," is that it?

4876 A. Well, the brick work. I speak of this portion here where it says—I see these runways are not valued very highly on the inventory.

By Mr. **Mathewson**:

Q. You mean by Mr. Mayer?

A. I mean by Mr. Mayer. If that includes all, of course the runways are certainly very dilapidated and the trestles are certainly very dilapidated. If the whole is comprehended in this $1,000, I do not think that would be out of the way. I had not noticed his valuation.

By Mr. **Page**:

Q. Well, is the whole thing included in that?

A. Well, it would require further investigation. After the making of this inventory I was filled with work of various other kinds, running here and there and making out tables, and I have had no opportunity——

Q. In connection with this case and in connection with the testimony you have been giving here?

A. Yes, sir. I have simply been working night and day and it was utterly impossible to go over the details which are given.

Q. If you had a little more time it would be an easy matter for you, from the notes that you have made, to testify in regard to this matter, wouldn't it?

A. Yes, I made rather ample notes.

Q. How much time would you need?

A. I would like to rest a little bit. I cannot say.

Q. Well, answer the question if you can.

A. Why, I could go over those papers in a couple of days, I presume, by working the same way that I have been working and working day and night.

Q. Can you from the notes that you have state the condition of the apparatus as you found it without giving the detailed figures?

4877 A. I found, as in the case of the 14th Street works, that only about two-thirds of the apparatus was in action in the generating plant. The purifier house is very old, and the roof is dilapidated; you could see daylight through it in a number of places.

Q. What about the apparatus in the purifier house, was that in pretty good shape?

A. The purifiers I should not allow very much depreciation on. They are in fair shape, although very old and constructed for lime, which they are also using now; they are using lime purification there to some extent. The meters I was speaking about, which I stated were of a very antiquated make and which I ascribed to 14th Street, would require considerable depreciation unless the drums have been recently renewed. You understand, the depreciation on station meters goes on within.

Q. Have you got it there?

A. No, I have not got it here.

Q. Take it as you go along, take the sheets one by one.

A. Those are computed at $10,875. I should allow some depreciation on them unless the drums have been renewed recently, and that I could not tell.

Q. In the schedule that was furnished you at 14th Street it stated what drums they had in the meter, and from that you were able to state that they were of a more recent construction?

A. Yes.

Q. Is there anything on this that would indicate that other drums have been put in?

A. No, there was no other indication or statement that they had renewed the drums, and the cases, as I said before, were of Gratz & Company, of Philadelphia; they must be forty years old, all of that.

Q. What have you to say about these benches?

A. The retort benches were of a much better type than the 14th Stre-t station and ought to give superior results, but there were one-third of them out of action. 4878

Q. Due to what?

Mr. Mathewson: Does he know?

Mr. Page: If he does not, he can say so.

A. Well, there were quite a number of them dropped, that is dropped for resetting, but one stack of them—one side of one stack, they were engaged in firing up at the time I was there, that is there was smoke coming out and they were putting fire under them. And I went back a couple of days afterwards to see if they were getting along any, and I saw they were not.

Q. What do you mean by that, that you went to see if they were getting along any and you found they were not?

A. I found the fire was not pushed, it was simply smoking and smouldering along in the same condition as on the previous day. I didn't know whether they had really made up their mind to fire the stack or were simply drying it out.

Q. Were they making gas in it?

A. No, it was not in a condition to make gas. It was just barely warm.

Q. And the same on each occasion?

A. Yes.

Q. Were the doors open?

A. It was not being pushed at all——

Q. The question was, were the doors to the retort open?

A. No, the indication about that is in these regenerative types, they put coke in and it fires up, and it takes about—well, after a bench is fairly dry, they would be simmering along for some little time before they put heat in them.

Q. Had these benches recently been reset or anything of that sort?

A. Yes, I think they had been reset.

4879 Q. What have you to say as to the physical condition of the benches?

A. They were in fair condition, those that were in operation, and I looked in all those I had an opportunity, except where the lids were off and they had a fair heat on and they were in fair condition except the oil gas portions. Those were filled with carbon. The oil gas was made in retorts about 20 feet long and what we call a through-and-through setting, seven to a bench, and from what I saw of those it looked to me as if they were in bad condition for making oil gas; in fact the results from them are poor also.

Q. Have you your notes here of this station? Why don't you take those?

A. Those were notes taken down by Mr. Midgley, as I was examining. I don't have them here; I do not suppose I was going to testify in detail in regard to the 42d Street station until I had an opportunity of figuring it up.

Q. Well, can you go on at all or not on this apparatus, Mr. Edgerton?

A. I do not like to go into details on apparatus I have not figured up, no, sir.

Q. What have you got to say about the condition of the buildings?

A. The retort house building is in very fair condition; there is nothing to be complained of about the condition of the retort house. The purifying house, as I said, the damage was in the roof and the roofs of a number of other buildings, coal sheds and so on, are not in good order.

Mr. Page: I do not see that it is really profitable to continue this examination.

The Witness: As I stated, I had no idea that any details were to be gone into in regard to 42d Street.

Q. And it is impossible for you to testify in regard to this 42d Street plant without sufficient time to calculate from the notes 4880 that you have or speak from the notes that you have already made, the value of the articles and the element of depreciation based upon the physical appearance, physical condition, is that it, Mr. Edgerton?

A. That is so. I took along a gentleman with me and he made the notes while I looked over the buildings, and my intention was to go over them rather thoroughly and figured out comparative costs.

Q. Have you been able, in the time you have not been on the stand, to make any examination of the 21st, 44th and 99th Streets plants?

A. I have had hardly time to eat my meals.

Q. Will you answer the question, please?

A. No, sir.

Q. How long would it take you to make an examination of those other portions of the plant and make the computations?

A. I think I could make an examination of the salient features, and as I have some plans to calculate from in regard to some of the apparatus contained, I could make it within ten days. I have more definite information in regard to the Lowe machinery and the setting of brick work which they put inside and the details connected with it.

Mr. MATHEWSON: By Lowe machinery you mean water gas machinery, as compared with coal gas machinery?

The WITNESS: Water gas machinery, yes. Coal gas machinery has been rather out of date for many years and engineers have not given it as much attention on this side of the water as they have water gas.

Q. Well, do you mean that in a week or ten days you could complete the examination and complete your computation and be ready to testify?

4881 A. I coul,d on the salient features, without going minutely into all these little outhouses and buildings that are listed here.

Q. That is by taking that portion of the apparatus that would be liable to depreciation, and that would constitute an important element in the value of the plant?

A. Yes, skipping over the minor matters and going only into such as were of importance.

Q. Mr. Edgerton, you used an expression in answer to one of Mr. Mathewson's questions, that there is no such thing as 34 degree oil, or some such phrase as that. What do you mean by that?

A. I meant that it was a misnomer to call any oil a 34 degree or 28 degree oil; the fact is that it is a mixture of a great range of oils; it is impossible to have an oil of any one degree, a 34 degree oil might range over from 47 down to 25, owing to the different component parts.

Q. You did not mean that there is no such think known commercially as 34 degree oil?

A. No, but I meant——

Q. If I understand you, and if Mr. Mathewson will not object, you mean there is no oil of 34 degrees alone or any particular degree alone.

A. No.

Mr. MATHEWSON: It is what they call a "blend"' in whiskies, or don't you know?

The WITNESS: It is a matter of the greatest difficulty to isolate a single degree of oil; it would require fractionation and refractionation and redistillation a number of times and then you would only end up with a small percentage of the amount you started with.

Q. And it is the average which gives it its commercial degree, as shown by the hydrometer?

A. That is all, as shown by the hydrometer, and for that reason all this particularization about degrees of oil in my experience is just simply empirical. I know how it originates; it is from the men handling the apparatus; if anything is out of order it is——

4882 Q. You mean degrees of oil for use in gas making?

A. In gas making. They very commonly say the oil is bad. They say if the machine is kicking, they say it is bad oil, and that relieves them from any more care or trouble about it. For that reason, I have had to make quite an examination into the oil feature in water gas and I find that the difficulties in handling oil are due to other features than simply whether it contains a certain quantity or one fraction or the other.

Q. What degree of oil do you use at Danbury?

A. Any degree, it doesn't make any difference, so that they can get it in a vapor, and it goes through the retorts. The heavier the oil the higher candle power gas it will make for the same number of cubic feet.

Q. What price do you pay at Danbury for your oil?

A. 4.2 cents, I think it is.

Q. What price have you been paying heretofore?

A. Well, I have paid, I think, as low as 3½ or 3¾. I found that at Norwalk what would be called by the generality of gasmakers, a superior oil was 3¾ cents——

Mr. MATHEWSON: Just a moment. I am going to object to the testimony of this witness about Norwalk unless he knows something about it. We have had a good deal of this, and it seems to me it is time to stop.

Mr. PAGE: Well, you have had very little so far about Norwalk.

Q. What is Norwalk?

A. Well, South Norwalk is the center of distribution for a great quantity of oils. They have about a dozen large tanks there, the Standard Oil Company, and they distribute from that point to the various users throughout Connecticut and some parts of Massachusetts.

4883 Q. Have you recently visited the tanks in the yards at South Norwalk?

A. Yes, sir, I have seen them twenty times within the last year, I reckon.

Q. Have you obtained within the last month or two samples of oil from South Norwalk?

A. I did. I took a sample of oil right out of the Standard Oil Company's tank, delivering it to the electric light station.

Q. And what price was that oil?

Mr. MATHEWSON: Just a minute. Is there any evidence that this witness knows what price the oil was, and to whom, and what grade of oil? What is it? It seems to me that is objectionable, and I object to it. The witness has not been shown to be competent.

The MASTER: It does not seem to me it is very material, unless you get it down a little closer to the question here.

Mr. PAGE: Well, of course, we cannot do everything at once. That oil was brought down here and tested and fractionated.

Q. Did you inquire the price of the oil at the time you got it?

A. Yes, sir; I got it from the superintendent. It is a public matter there, it is a municipal plant there and their accounts are published.

Mr. MATHEWSON: I suppose then the superintendent can testify, and if the accounts are published, they can be produced?

The WITNESS: Yes, I can get you the accounts and can get you the bills.

Q. When you say the superintendent, is that the superintendent of the works or the superintendent at the tank yards?

A. The superintendent of the electric light plant or manager.

4884 Q. And he told you that he paid?

A. Yes, showed me the price and told me all about their contracts, and told when they had changed them and——

Q. Other than that do you know the price that the Standard Oil Company charges for that particular grade of oil at South Norwalk?

A. No, I don't know the price for any other parties except that electric station.

Q. This sample of oil, whatever it was, that you obtained there at South Norwalk, you brought here to New York, didn't you?

A. Yes, sir.

Q. To whom did you deliver it?

A. I delivered it to Professor Sherman of Columbia University, and directed a fractionation of it, directed freezing tests and Beaume tests and all the tests that are usually applied to oil.

Mr. PAGE: We will produce, if we are given an opportunity, this superintendent who will testify to the price of this Norwalk oil.

Q. Did you also bring down a sample of the oil that you use at Danbury?

A. Yes, sir.

Q. And did you deliver that sample to Professor Sherman?

A. I did. That was a sample of January 6, 1905. I think we were getting it at a little better price then than now.

Q. January 6, 1905?

A. Yes. We have at Danbury—I picked out from among the samples, there were about a dozen samples brought down. We make it a practice at Danbury to keep samples of the tanks. We have samples for four or five years back, I think, over a hundred of them.

Q. Do you know the price at which that oil was sold in 1905?

A. No, sir, but I can get that. I think it was a little less than at present.

4885 Cross-examination by Mr. MATHEWSON:

Q. Now, you figured an ideal cost price of 23.26 cents at the holder for gas of the Consolidated Gas Company to be manufactured under assumed conditions and I understand that that gas was to be chiefly enriched coal gas, is that right?

A. Yes, sir. The first——

Q. Enriched 14 candle power coal gas you said?

A. Yes, sir.

Q. You assumed then that the coal gas itself would produce about 14 candle power unenriched, did you?

A. Yes, sir, as the ordinary way of testing it with the argand burner.

Q. Well, don't you know that gas is tested with a flat frame burner in New York and not with an argand?

A. Yes, that is for the reason that the New York——

Q. No matter about the reason. I am asking you whether you know that to be the fact?

A. I know it is, and I introduced it myself, that is, I was instrumental in getting the flat frame burner introduced.

Q. What would be the candle power of gas tested in a flat frame burner which showed 14 candle power tested on the argand burner?

A. It would be about 11 candles, 11 or 12 candles, with the best flat flame burner.

Q. What proportion did you assume would be this coal gas enriched and what proportion water gas in your final mixture?

A. One calculation is half-and-half——

Q. No, this 23.26 cents. The enriched coal gas; my impression is that you said you added a little water gas to it in your estimate?

A. Oil gas.

Q. Oil gas?

A. I added a little water gas to the oil gas.

4886 Q. Well, now let me know how much of your mixture would be coal gas, how much oil gas, and how much water gas?

A. It would be about—I have added 225 cubic feet of that mixture to the thousand.

Q. Which mixture?

A. Of the mixture of oil gas.

Q. And water gas?

A. Oil gas 70 per cent., and water gas 30 per cent.

Q. And this mixture composed of oil gas 70 per cent. and water gas 30 per cent. amounts to how many feet per thousand of the coal gas?

A. About 225.

Q. 225 feet mixed with a thousand feet of unenriched coal gas, is that right?

A. Yes, sir.

Q. Well, do you mean that this 225 feet of oil and water gas is mixed with one thousand feet of unenriched coal gas or that one thousand feet of the mixed gas is made up of 225 feet of oil and water gas and 775 feet or enriched coal gas?

A. Yes, you are right, 225 feet of the thousand are this mixture and 775 feet of the coal gas.

Q. You know that about four-fifths of the present output of the Consolidated Gas Company is water gas, don't you?

A. Yes.

Q. So that in order to produce more than three-quarters coal gas of the total output it would be necessary to reconstruct the water gas plants to a considerable extent, would it not, and substitute coal gas apparatus for it?

A. No, I assumed that the coal gas would be made at the new works.

Q. At the Astoria works?

A. At the Astoria works, and the water gas would be made over here, that is, water and oil gas, that would be made in the water gas works.

Q. Well, that would be a substitution, would it not, if you simply take the present manufacturing capacity of the Consolidated Gas Company and reproduce it in coal gas?

4887 A. You would have to make an additional amount of coal gas to what you are now making, certainly, very largely.

Q. How would you mix them in that event and where?

A. Well, they would have to be mixed over on this side, they would have to make their arrangements to mix them before entering the holder properly.

Q. It is in evidence that the present output of the Consolidated Manufacturing plant is, say, ten and one-half billion feet, and they sell more than three billion additional per annum and that the first unit at Astoria will produce four billion feet or only one billion feet per annum more than the gas manufactured for the Consolidated by other companies. Then there would be no great surplus manufacturing capacity of coal gas in that event, would there?

A. No, I assumed in this that they would go on with the——

Q. And put on other units?

A. Yes.

Q. Even in that event it would take a considerable expenditure and certainly another unit in addition to the first unit at Astoria with a capacity of 4,000,000,000 cubic feet before you could get your production up to 77½ per cent. of coal gas as against 22½ per cent. of oil and water gas, would it not?

A. Yes.

Q. And it would virtually mean therefore the abandonment of the water gas stations in New York in large measure, no matter where that manufacturing capacity was replaced, if you were to get that proportion of coal gas, would it not?

A. They would have to shut down to a considerable extent on the water gas production, certainly, to make the addition of coal gas.

Q. I would like to have you give me again the elements which make up the cost of this unenriched coal gas, not deducting 4888 any residuals. We will do that later. Give it to me sufficiently slowly so I can follow it, please.

A. You add to the cost of coal gas up to the——

Q. I am trying to get coal gas in the first place.

A. Do you want me to go through all the details?

Q. Yes. You figured, if I understand you correctly, and assumed the same item in your later computation, that the net cost of material and labor after deducting residuals would be only 6½ cents?

A. 6.46.

Q. Now I want in the first place the cost of the material and labor in detail and secondly the items in detail which you deduct to produce that remainder of 6.46 cents.

A. Bituminous coal $3.20 a ton, yield, 10,600 feet to the ton, that is 32.2 per thousand.

Q. Short ton?

A. Yes, sir. Cost of unloading 10 cents per ton, charging and drawing coke, .44 cents, handling and yarding, 4.48 cents.

Q. Now give me the details of the 4.48 cents divided into the different classes?

A. I put that at, putting coal into the retort at 2.24 and drawing coke, quenching and yarding and handling coke at the same, that is 2.24 cents per thousand feet of gas; that included the purifying.

Q. Is that what is known as yard labor?

A. Yes, that would comprehend all the labor except some under the term of general expense at works, which would include some labor, one-half cent 36.62 cents.

Q. Then if I understand correctly your total expenditures you figure in the unenriched coal gas are as follows.

A. No, that is what is wrong. It is not the total expenditure for unenriched coal gas.

Q. Well, the expenditures for unenriched coal gas, but not the total expenditure.

A. Yes.

Q. You put bituminous coal at $3.20 per short ton 30.2
4889 cents, figuring a production of 10,600 feet per short ton; un-
loading, ten cents a ton equals 1.44 cents per thousand; charging 2.24 cents per thousand; drawing coke, quenching and handling and all yard labor, 2.24 cents per thousand——

A. No, that does not include all yard labor. I said there was half a cent more.

Q. Except superintendence?

A. No, a half cent in general expense at works.

Q. By labor it includes all except half a cent for superintendence and half a cent for expense in general expense?

A. Yes.

Mr. Page: It includes .5 of a cent for superintendence.

Mr. Mathewson: That is brought in later.

Q. Then .5 of a cent for superintendence?

A. Yes.

Q. Making a total of 36.62 cents, is that right?

A. That is so, but it does not bring the total until it gets into the holder.

Q. I have not got to that point yet. What rates did you charge for labor in the yards in computing this 2.24 cents?

A. $1.75 for ordinary labor and $2.50 for gas labor, gas makers.

Q. How many hours per day?

A. Two shifts 12 hours.

Q. Each?

A. Yes.

Q. Now, how many men did you allow, the same number that the Consolidated is now employing or did you not know how many they are employing in that connection?

A. I allowed a compromise between the amount they employed in their coal gas works, that is a yield per man, I think, of 24,000 feet, but this is based upon inclined retorts and handling an entirely different apparatus. It is much more economical than the ordinary

coal gas plant. In fact, it is based on about 3 cents for labor,
4890 for retort house labor and for other handling besides that.

Q. You find no inclined retorts at present in the Manhattan plants, however?

A. No.

Q. And didn't you know that in the construction of the Astoria plant, after a long consideration, that not all inclined retorts were installed there?

A. I understood they were about half and half, that is, they were going to try half horizontal and half inclined.

Q. Now let us take the additional items, to be added to the 36.62 cents to make the total cost in holder before residuals are deducted.

A. That is exclusive of the oil gas enriching?

Q. Yes.

A. Repairs to apparatus and buildings 4½ cents; purifying material, lime .75; oxide .25.

Q. That is a total of one cent?

A. A total of one cent for purifying material.

Q. Without labor?

A. Without labor, oil and waste .37 cents, such water as is required around for washers and so forth, .17 cents. General expense at works, which includes odds and ends of labor and draying, expressing and such items as I generally put into general expense, .5 of a cent. Those are the coal gas items.

Q. That makes how much, added to your 36.62 cents?

A. I do not add them—I then after——

Q. Won't you do so now? I would like to proceed from that point.

A. 43.16.

Q. Now that is the total of your unenriched coal gas before residuals are deducted, is it?

A. Yes.

Q. Now will you be good enough to tell me what your residuals are in detail?

A. I allow 1,320 pounds of coke per ton of coal, coke and breeze.

Q. And you figure the price received at how much?

A. I deducted from that 20 per cent. as the amount they used in firing the retorts and the balance I take at $4.00 a ton valuation, making——

4891 Q. Does that include the breeze?

A. Yes, that includes a percentage of the breeze. I used that——

Q. Making how many cents per thousand?

A. Making 19.8 cents per thousand.

Q. 19.8 cents per thousand for coke?

A. For coke. Tar, 12 gallons at 5 cents——

Q. Makes how much per thousand?

A. 5.65 cents.

Q. Per thousand feet of gas 5.65 cents for tar is that right? That must be a mistake, is it not? You said 5.68, I thought, before.

A. Yes, that is erroneous. It is based on a ton.

Q. Well, that 5.65 cents was based on a ton of coal, which was an error, was it not?

A. Well, the twelve gallons is based on a ton of coal, yes.

Q. Won't you correct that error and see what it should be?

A. It is .56 of a cent.

Q. .56 of a cent, is it not, instead of 5.65 cents?

A. Yes, although that seems to me to be a low figure for tar return.

Q. Well, we are taking your own figures and correcting the error which you made in your first computation, keeping your other figures; the result would be .56 of a cent, would it not?

A. Yes.

Q. Now, what is the next item of residuals?

A. Ammonia liquor.

Q. And how much of that do you allow and at what price?

A. Well, now, that price is at about 28 pounds of sulphate of ammonia to the ton. I have not—I got that by allowing 50 cents per ton receipts. I do not think that would correspond exactly. In fact, it would probably be a little higher. I had to figure that out last night without having got hold of the wholesale price of sulphate of ammonia, and therefore I put that in there at 50 cents on the ton.

Q. Well, fifty cents on the ton of what?

A. On the ton of coal.

4892 Q. On the long or short ton of coal?

A. Short ton of coal.

Q. Well, that is 4.7 cents, is it, on that computation?

A. 4.7 cents.

Q. Now, is that all the residuals that you deducted in your computation?

A. That is all.

Q. Well, that makes how much for residuals—is that .47 of a cent or 4.7 cents?

A. .47 of a cent, according to that calculation.

Q. So that makes a total of how much for all residuals?

A. 20.83 cents.

Q. Is it 20.83?

A. Yes, 20.83.

Q. Now, if you deduct 20.83 from your total cost of material and labor which was 43.16, you get a net cost for the unenriched coal gas of how much?

A. 22.33.

Q. And if you deduct 20.83 from your 36.62 which you used in your original computation, you have a remainder of how much?

A. From 36.62?

Q. Yes, and if you subtract your residuals from 36.62, because you did deduct your residuals before from 36.62, and you got a balance of 6.46 as the net cost of labor and material before some other items were put in—I want to find what that should be?

A. 15.79.

Q. So that instead of being 6.46 cents as you said on your direct-examination, it should be about 150 per cent. greater than that, or a total of 15.79?

A. 15.79. There must be some error there still, for I have not compared that with the Central Union residuals of 29.06——

Mr. MATHEWSON: Well, perhaps the Central Union made a mistake and got too much, but we will take your figures, and if that disposes of the coal gas unenriched, we will pass on to the oil gas.

At this point a recess was taken to 2:15 P. M.

4893 After Recess.

HENRY H. EDGERTON resumes the stand and further testifies:

Cross-examination continued by Mr. MATHEWSON:

Q. In your computation you gave unloading as ten cents a ton, or as 1.44 cents per cubic foot. The number of cubic feet in a ton is 10,600 you stated?

A. Yes.

Q. How do you get 1.44 cents by dividing ten cents by 10,600?

A. That is an error in the decimal points there. It should be——

Q. It cannot be an error in the decimal point, because it would not be 1.44 cents regardless of the decimal point, would it?

A. Well, I will tell you how that occurred. I can see there an error plainly. I took discharging at 15 cents a ton, and then I come to consider in figuring it up I had coal unloaded at 12 cents a ton, at $3, in Butte and various other places. It was 10 cents a ton in Danbury for unloading coal, and so I changed that to 10 cents a ton accidentally in place of 15. The price of $1.44 was got from 15 cents a ton.

Q. Then 1.44 cents is error?

A. Yes, that should be 14.4.

Q. No, it would not be 14.4, would it? Suppose you divide 10 cents by 10.6, because there are 10,600 cubic feet, are there not?

A. Yes. I say in the first calculation, judging 15 cents for unloading and dividing by 10.6, I got 14.4, and with the cost of unloading to 10 cents, would bring it to——

Q. .94 cents?

A. No, it would be .94.

Q. Yes.

A. That is, I mean .094.

Q. Now, what do you make it?

A. I make it .094.

4894 Q. .09. Now, as a matter of fact, if you divided 10 by 10.6, doesn't it give .94 instead of .094. It is about one-tenth, isn't it, a trifle less than one-tenth?

A. No, it is 10 cents on a ton and there are 10,600 cubic feet to a ton.

Q. So that your final figures are .094?

A. Yes.

Q. Then your computation should be corrected in that respect, should it not, as it now stands?

A. Yes, sir. I think it needs correcting in several particulars.

Q. Then if you divide 15 cents by the amount of gas that one ton produces that could not have produced with accurate division 1.44 cents, could it?

A. I think pretty nearly.

Q. Well, could it? If dividing 10 cents by 10,600 or 10.6 produces .09, how could dividing 15 cents by 10.6 produce 1.44?

A. Well, it is a mistake in the position of the decimal point, I see.

Q. It is a mistake even if you divided 15 cents by 10.6 originally, wasn't it?

A. I don't know as it is out of the way.

Q. Supposing you divide 10 by 10.6?

A. 15 by 10.6.

Q. That is 1.44, isn't it?

A. That is 1.44.

Q. Then if you divide 10 cents by 10.6, it would not be .09, but it would be .94, would it not?

A. No, sir.

Q. Will you divide 10 cents by 10.6 and see if that does not give .94 instead of .094?

A. No, that would bring, if you multiply them back—you would get ten cents, instead of that you get one dollar.

Q. Well, what do you get by dividing 10 cents, then, by 10,600?

A. I get .094.

Q. Well, now, that is what you would get if you divide 10 cents
by 10.6. Now, I am willing to take your answer. Ten cents
4895 per ton would be how much per thousand if a ton produces
10,600 feet?

A. That would be 9 cents, I think.

Q. .94 of a cent, wouldn't it?

A. Yes, sir.

Q. Now, you took $4 per ton as the value of coke residual, on the theory that it would be used instead of anthracite coal under the boilers or under the apparatus producing coal and water gas, didn't you?

A. I proposed to use it in the generators, yes.

Q. Well, the generators mean coal and water gas, don't they?

A. Yes, sir.

Q. You did not find that the coke actually sold for $4 a ton by the Consolidated Company, did you?

A. No.

Q. And you made this allowance on the theory that it would be used under the generators?

A. A portion of it, yes.

Q. Now will you tell me whether if you produced the amount of enriched coal gas which you proposed and only 225 feet out of each thousand of water and oil, whether you would use more than 5 per cent. of your total production of coke under the oil and water gas generators?

A. Well, you would not use a very large percentage of it.

Q. It would not be more than 5 per cent. at the outside, would it?

A. I have not figured that up. I think it would be a little more than that.

Q. And what you did not use under the coal and coke generators you would be obliged to sell, would you not?

A. Yes.

Q. And if we produced that amount of coal gas it would make more coke on the market than there is now, wouldn't it?

A. Yes, sir. Still, I consider $4.00 a ton would be——

Q. I understand what you consider. I am getting at the figures now. Now, let us take the sulphate. What price did you expect to get for that in these conclusions of yours?

4896 A. Well, my calculation was made up yesterday. I did not have access to any market figures about those prices, and I supposed my prices balanced the Central Union, but I found this error in calculation had thrown them out somewhat, and that is what misled me.

Q. Well, do you want to revise your calculation as to that?

A. Yes, I think that it should be revised to the prices of products here. This morning I tried to get a price on one of these products, and yesterday I took that from recollection, from what my experience was.

Q. What did you take in this computation from recollection as the price for sulphate?

A. I took the yield of the sulphate, I think, about thirty pounds to the ton of coal, and——

Q. Thirty pounds to the short ton?

A. Thirty pounds to the ton of coal; twenty-eight to thirty pounds.

Q. Well, how much does that mean per long ton?

A. That would mean slightly more than about ten per cent.

Q. It would make between thirty and thirty-five pounds per long ton, wouldn't it?

A. Yes, I think twenty-eight pounds would be a fair statement of that.

Q. Was that what you assumed in your computation?

A. I think it was about twenty-eight pounds.

Q. Then per long ton that would mean nearly thirty-one pounds, wouldn't it?

A. Yes, sir.

Q. Don't you know that the general experience in this country is a little over twenty pounds, instead of thirty-one pounds of sulphate?

A. No, I don't know that. I tried——

Q. You know they get a little more in England than they get here because they run lower heats?

A. I don't know as they get any more. I should think it would be about the same, with the same care.

4897 Q. Well, you found there was more sulphate than was actually obtained, didn't you by the works in New York?

A. I don't know as they make any sulphate at all. I didn't see any evidence down there. I think they trade off their ammonia liquor and sell it as liquor.

Q. Now, give me the name of any company here or hereabouts, a large company, that is producing thirty-one, or anything over thirty, or even thirty, pounds of sulphate per ton?

A. Well, I don't remember since the New Orleans Company gave up making sulphate of any figures in connection with it. I have forgotten. My recollection, however, was that they made as much as that, but it has been quite a number of years; I would not be positive about it.

Q. Don't you know as a fact that the average obtained per long ton of sulphate in this country does not much exceed twenty pounds per thousand feet?

A. I should think that was a very small yield.

Q. That may be so, but don't you know that that is the fact?

A. No, I do not.

Q. What price did you calculate for sulphate?

A. Well, I had not access to prices. As I say, I was trying to quote the market this morning on it to see if I could confirm my price. I found since, though, that the price here is $4 and a fraction a hundredweight.

Q. That is the price you used in your computation?

A. No, I didn't use that price; I used a lower price, but that is the price here. I don't know that it would be called a wholesale price. It is the best price I could get.

Q. What price did you use in your computation?

A. I did not use a price on sulphate, because it is based more on the liquor than the sulphate, because most gas companies here sell their liquor, and do not treat it for sulphate. It requires a special plant, a sulphuric acid generating plant and a lot of paraphernalia. 4898

Q. Where do you get in, in your statement of expense here, the cost of producing the sulphate from the liquor?

A. Well, I have not gone into producing the sulphate from the liquor. The gas company here does not do that, and they are somewhat at sea about that, so we have to go into it in another way. I looked at the Central Union sales of liquor, and, seeing that it corroborated their sales for residuals, corroborated my own offhand figures. I did not look farther into it. I took the ammonia at——

Q. But if you sell sulphate and regard it as a residual, you must include in the expense the cost of producing the sulphate from the liquor?

A. Certainly.

Q. Where is there in this statement of "cost to holder" which you have presented, where is that expense provided for?

A. I did not go into details of that expense of making sulphate of ammonia. I did not consider it that way. I looked at it just as most of the companies sell it. They sell it as a liquor. I do not think that there are very many manufacturing plants in the country that turn it into sulphate of ammonia.

Q. Well, did you allow fifty cents per ton for the liquor?

A. I allowed an amount for the liquor that I consider was justified by the receipts of the Central Union.

Q. Well, what is that amount that you allowed, regardless of where you got it?

A. I got it from this book somewhere.

Q. Which book?

A. The Central Union printed case on appeal. I got this more to back up my offhand estimate. "Ammoniacal liquor and receipts therefor, $17,514"; page 210. And that is based upon 670,518,000 cubic feet of coal gas.

4899 Q. What do you mean by saying you took fifty cents per short ton and dividing that by 10,600 feet produced by a ton you got .47 cents? What was it that you computed at fifty cents per ton? The ammoniacal liquor?

A. The value of the ammoniacal liquor proceding from a ton of coal; but I see I have made an error there, in that it is too low.

Q. What is too low?

A. The fifty cents.

Q. Do you know of any company hereabouts that gets fifty cents per ton for ammoniacal liquor?

A. That is all. I have got the $17,514——

Q. From the Central Union?

A. From the Central Union.

Q. Outside of that you don't know of any company hereabouts that gets fifty cents per ton for ammoniacal liquor?

A. Per ton of coal, you mean? . I based it on the ton of coal.

Q. You based it on fifty cents per ton of coal?

A. Yes. I see there is an error.

Q. The Central Union does not get any such figure as that, does it?

A. I think they get more, according to their statement here; $17,514.06.

Q. Won't you look at the Central Union record to which you have referred and see if the Central Union does not get about three cents per thousand feet?

A. I think they get calculated out according to that 2.62 cents; yes, sir.

Q. And if you multiplied 2.62 cents by the number of cubic feet in a ton, number of thousands, that would be multiplied by 10.6, wouldn't it?

A. Yes, sir.

Q. Wouldn't that give only twenty or thirty cents per ton instead of fifty cents? Just figure that out and see how much that would be, multiplying that by the number of thousands produced by the ton at the Central Union coal gas works? 27.77 cents, wouldn't it?

A. Yes, sir.

4900 Q. 27.77 cents, that would be the result instead of fifty cents, wouldn't it?

A. Yes, sir.

Q. Now let us take the subject of tar. You computed tar at how much; five cents?

A. Five cents a gallon.

Q. Don't you know that that is very much greater than the market price for tar in the City of New York?

A. Oh, I just had a quotation in quantity at nine cents.

Q. Had a quotation of what?

A. I simply telephoned to a large dealer.

Q. Let us have the name of the dealer? Tell us the name of the dealer, will you?

A. That I have forgotten. It was just through the telephone communicated; it was to see how it varied from my figures.

Q. That was for refined tar in the City, wasn't it, that you got the quotation, and not for tar liquor that had been produced by a gas company in that shape?

A. The inquiry was for coal tar, just the ordinary coal tar, and no refining about it, because when it is refined it is not coal tar any more.

Q. Was that the price at which this concern to which you telephoned could purchase the ordinary coal tar or the price at which they were selling the ordinary coal tar?

A. That was the best price. That I understood to be the buying price; I understood it was such a price as could be obtained.

Q. Try and think of those people, because we would like to make their acquaintance. Try to think for a minute. I want to know who that is that is willing to give that price.

A. A third party put me in communication with them over the telephone, just simply to see what difference there was between my own assumption of the cost price of tar and what they really obtain here in the city, to get New York City conditions, if possible.

4901 Q. Was it a price for a large amount of coal tar, or was not any amount stated?

A. The idea was to get their price for a large amount.

Q. Did you yourself talk with these people over the telephone?

A. No, I don't think I did.

Q. Who did?

A. Mr. Kirby did, I think.

Mr. Mathewson: I wonder if Mr. Kirby, who sits here, would mind giving us the name of the concern that would pay that price?

Mr. Kirby: I will give it to you, but not on the record.

Q. You don't know, then, that the price which the companies are able to obtain for coal tar in the City of New York exceed little, if any, 2 cents instead of 5 cents, do you?

A. Well, I never knew of tar being sold at any such low prices.

Q. You never sold any in New York nor bought any, did you?

A. Everything seems to be different here from everywhere else.

Q. Well, it is different in some respects, in a good many items, of course?

A. All items the company buys are dearer, and everything they sell cheaper.

Q. How much coal tar did you ever sell from one plant, do you think?

A. Well, I sold altogether, I think that I sold some 100,000 gallons at Butte, maybe more than that, because they took the Helena supply also at 17 cents a gallon. I sold it at $5 a barrel and considered that a very low price where there was any asphalting going on and I should think you have plenty of it. I guess the middlemen must milk you out pretty well there on prices, for with all the asphalting going on and the use of coal tar——

4902 Mr. MATHEWSON: I move to strike out this testimony of the witness now as to the quotation he got for coal tar, on the ground that the witness did not get any such quotation, but it was gotten by another gentleman who is not on the stand. I cannot very well follow this up and cross-examine through this witness as to facts collected by some one else.

The MASTER: I suppose you are entitled to have it stricken out. I do not see what particular advantage it has. It appears on the fact of it that it is not of any great value. If it is stricken out I suppose the Senator can insist upon its remaining on the record anyway and getting his exception.

Mr. PAGE: Yes, I would take the exception because of all the concealments that have been made from the record of the names of parties that are dealing with the Consolidated Gas Company, and in view of our submitting to it it hardly seems that such a rule should not apply to the other side in one instance.

Mr. MATHEWSON: On the contrary, in the case of every person with whom we have dealt the contract is in evidence here, filed with the Master, and shows exactly with whom it is, and it is subject to your inspection. It merely has not appeared at length on the minutes.

Mr. PAGE: I will submit Mr. Kirby as subject to your inspection. He says he will tell you.

Mr. MATHEWSON: Very good.

Q. That, I think, exhausts the subject of the enriched coal gas. Now let us take the oil gas. Do I understand that you manufacture the oil gas separately and the water gas separately and then mix the two, making 225 feet out of each thousand of the total mixture?

4903 A. I have here at the rate of thirty cubic feet of water gas to seventy feet of oil gas, and propose to use 225 feet of that mixture to bring up the thousand.

Q. I understand that. Let us take the 70 per cent. of the 225 feet which is oil gas. Please give me the details of the cost of that oil gas?

A. Oil is reckoned at 2 gallons at 4.23 cents, that is 8.46 cents; generator coal per thousand feet of that mixture of gas, 20 pounds per thousand.

Q. Which mixture, I am talking about the oil gas now.

A. Well, that mixture, oil gas and water gas, it takes less actually—I have used actually twenty-eight pounds per thousand make and on a small scale compared with that.

Q. Yes, at what price?

A. I took that at $4.00 a short ton. That amounts to one cent per thousand.

Q. That is coke that you took, assuming it would come from the coal gas plant?

A. Well, coke or coal. Then I put in for labor .3 of a cent for that amount, 225 feet.

Q. .3 for what?

A. For that proportion of oil and water gas 225 feet. I do not add it in for a thousand because this calculation for a thousand is based on the whole amount. It is only based here on this 225 feet. It would be 1,000 divided by 225 and multiplied by .3, would be actual labor for the oil and water gas parts.

Q. Labor is .3 of a cent, is it?

A. Labor is .3 of a cent for 225 feet, that is the proportion.

Q. But we are not getting at the oil gas at all. Can you not give us the oil gas and water gas separately? Seventy per cent. of your 225 feet was going to be oil gas. I am trying to get at the cost of that oil gas.

A. That is the way I got at it here. I charged the percentage——

Q. You said you computed seventy per cent. of the 225 feet as oil gas and thirty per cent. of the 225 feet as water gas, and now 4904 I am taking the cost of each.

Mr. Page: But they are to be made in the Lowe apparatus, so the water gas is to carry the oil gas through the super-heater, and it cannot be separate labor because the water gas, the steam goes into one end of the generator and the oil at the top and they mix up and go into the super-heater.

Mr. Mathewson: I understand, unless he separates it by some way of apportionment——

Q. You did separate it, did you?

A. No, I proportioned the cost per thousand on the whole body of the gas on the basis of 225 feet for the oil and water gas. That seemed to be the most feasible way of carrying it out, for it then brought the price per thousand of the whole product. And, by the way, I am not sure that I deducted that 225 feet of oil gas and—whether that should not have been added to the thousand of coal gas, making the combined gas 1,225 instead of one thousand feet. However, that would require a new examination.

Q. Can you not tell, because that is quite important in our comparison?

A. Well, it is important both ways. I have stated it at 225 feet of oil and water gas and 775 feet of coal gas. But from the way it is put in here I am a little uncertain whether that should not have been added, for I have calculated the total cost of the coal gas up to that point at 14 candle gas and it would depend entirely whether that 225 feet would enrich the thousand or the 775 feet. I would have to revise my calculation in that respect.

Q. If it were going to enrich a thousand feet of coal gas you would require a higher candle power oil gas than if it were going to 4905 enrich 775 feet?

A. Well, this is of a very high power.

Q. I understand, but it would require more enriching to enrich a thousand feet of coal gas than 775 feet, of course?

A. Yes.

Q. Let us try to make sure now just what your amount of coal gas to be enriched is, whether 775 feet or whether 1,000 feet?

A. Well, I would have to go into an extended calculation on that, of the proportioning of the candle power of those two gases and dividing——

Mr. PAGE: Can you do it now, Mr. Edgerton?

The WITNESS: I do not like to undertake that in the confusion, my mind is a little confused on other matters and in figuring out, I am not sure about it, whether it is the 1,225 feet or 1,000 feet. It would require going into a detailed calculation on the——

Q. Now, as a matter of fact, Mr. Edgerton, you figured your two gallons of oil at 4.23 cents per gallon or a total of 8.46 cents as producing 225 feet of gas, didn't you?

A. No, it would take a great deal more gallons than that.

Q. How many feet of gas did you figure that would produce, 70 per cent. of 225?

A. It would increase the number of gallons of gas and water gas by the ratio between the 225 feet and the thousand feet. I have not got this down here. It has been calculated off of the books——

Q. But how many cubic feet did that two gallons of oil amounting to 8.46 cents represent?

A. I will have to figure that up. What is the question?

Q. How many cubic feet do the two gallons of oil at 8.46 cents represent or produce? You have said it was not the 225 feet. Was it seventy per cent. of the 225 feet?

4906 A. Well, the two gallons of oil alone at the maximum yield would be about 140 feet of gas, that is allowing seventy feet to the gallon.

Q. Of what candle power?

A. Well, that would be according to whether it was used pure or whether diluted with water gas.

Q. Well, used pure for the present?

A. Well, the candle power would be decreased, using it pure. It is increased by putting some water gas in it.

Q. Just give us 140 feet of pure oil gas?

A. Well, figured in the combination——

Q. No, not figuring in any combination.

Mr. PAGE: Give it pure if you know what it is.

Q. What candle power will be produced in 140 cubic feet of gas produced by two gallons?

A. About sixty used alone, but used with other gases——

Q. I have not got to that. Please answer my question and we will get there ultimately, I assure you. What candle power will these two gallons producing 140 feet yield, or what candle power will that pure oil gas be?

A. Well, burned in the best flat flame burner it would be about sixty candles.

Q. Why do you take two gallons producing only 140 feet in this comparison? What are the 140 feet? I understood you to say that the oil gas was about seventy per cent. of the 225 feet?

A. Yes.

Q. It would be much more than 140 feet?

A. It would be slightly more, yes. It would be——

Q. It would be 157½ feet, would it not, seventy per cent?

A. Yes, it would not be—no it would be a greater amount than that.

Q. Seventy per cent. of 225 feet would be 157.5 feet, would it not?

A. Yes. You are calculating on the 225 feet?

Q. Then seventy per cent. of the mixture of 225 feet mixed oil and water gas would not be oil gas, would it?

4907 A. Thirty per cent. would be water gas and seventy per cent. would be oil gas.

Q. Well, would it be seventy per cent. oil gas?

A. Not quite, no. There is a slight difference there. I supposed it was a yield per gallon that I got, to——

Q. You generalized it, didn't you?

A. No, I have got out of oil all the way from——

Q. Well, in this computation you generalized it, didn't you?

A. I did not take any one result, I took a computation of the average results. It is not based on any particular result.

Q. Then we are going to get 140 feet, I judge, of oil gas out of this, that will leave how much water gas?

A. 85 feet.

Q. You cannot give the additional elements beyond the oil in producing the oil gas separately, can you?

A. I gave the coal and labor, but it is a figure implied in the whole mixture of gas, that is, the coal and oil.

Q. And when you gave the coal and labor as one cent, you said it was one cent per thousand feet. Did you mean one cent for 225 feet?

A. No, it is one cent based on the whole mixture of gas, that is, it would be the increased amount.

Q. On what whole mixture, oil and water?

A. Oil and water and coal gas, the whole thing is calculated on the basis——

Q. We have got rid of the coal unenriched gas. Now, I am trying to get the oil and water gas which are made separately and mixed together with the coal gas.

A. I would have to go into another calculation entirely to meet your views on that. It is calculated on the basis of the whole mixture of gases.

Q. Well, I do not understand why you took two gallons of oil and figured on the basis of 225 as to your oil if you figure 1,000 feet in your other elements of cost?

4908 A. Well, the statement of 225 feet is just based on that percentage of mixture. The actual cost per thousand is based on the thousand feet of the whole gas. I made no calculation here on the separate costs of the oil gas. That was put in on the basis of being a thousand feet enriched gas or 1,225, it may be here, for I may have added that. I would have to calculate whether the 225 would give the candle power required.

Q. And you do not know now, do you, whether it is 1.225 feet or 1,000 feet?

A. I could not go it without aliquoting and making the proportion of candle power of 14 and the oil and water gas——

Q. Do anything to satisfy yourself because that is a matter of importance, to know whether you used the oil and water gas mixed with 775 feet or 1,000 feet for purposes of enrichment.

Mr. Page: Take your time and figure it.

The Witness: I do not care to figure it in that way, for it took me a long time, I was four or five hours struggling with these figures and consulting different handbooks and memorandums to get that, and now to figure it out on some other basis——

Q. I am not asking you to figure it out on some other basis. I am merely asking you whether your final result is produced here by mixing 225 feet of oil and water gas mixture with 775 feet of coal gas or with a thousand feet of coal gas?

A. Well, I say that involves calculating out the candle powers of the oil and water gas and the coal gas and ascertaining whether it requires that amount to bring it above the 22 candles; it is the only method we have, and it involves there—as it has water gas in it and oil gas and coal gas, it involves quite an amount of figuring.

4909 Q. I know, but you certainly must have known what the total mixture was or else you could not have told how much enrichment you needed to bring it up to the required candle power, must you not?

A. I did, but I have not kept the figures on this book. I had separate papers on which I figured it out.

Q. Have you the memorandum in that book so far as you can give any details?

A. I have only a memorandum of the results. There is a large amount of figuring to be done outside of what is in the books.

Q. Have you any objection to my seeing those figures to which your attention has just been called, to see whether I could get anything out of it?

A. No. (Handing book.)

Q. Are those the figures there?

The Master: That does not convey much to the record.

Mr. Mathewson: I know it does not. I am thinking of putting it on the record, if necessary.

The Witness: These are results which have been corrected and twisted in such a shape that I cannot tell. I would have to go to work, Mr. Mathewson, and figure over quite a little to make out that the mixture of gas, oil, coal and water gases, which would go fairly above a 22 candle power gas, to find out whether that is 225 on a thousand or 225 of the thousand. I do not think it is clear there, it is not clear to my mind which way I have got it.

Q. Can you not tell at once by taking the candle power of the mixture and the candle power of the coal gas?

A. No, you cannot tell at once. It is quite a—you would have to consult——

Q. You stated that the candle power of pure oil gas produced as you have indicated would be sixty candles?

A. Yes, sir.

4910 Q. Can you tell the candle power of the entire 225 feet taken as a whole?

A. No, because the candle power of the oil gas is a shifting figure. As you put the water gas in it you increase the candle power up to a certain amount and after awhile you decrease it by putting in further water gas.

Q. But you must have taken that all into consideration?

A. I did, as I say, I have not the figures here and cannot carry them in my head.

Q. How can you tell how many feet it would require to enrich unless you knew the candle power of the 225 feet?

A. As I say, I had to calculate all those matters out in detail before I commenced to figure on the cost.

Q. And you have not any details here from which we can check your figures?

A. No, I cannot give you those until I figure them out and it would take——

Mr. MATHEWSON: I would like to have this marked for identification, and will you give us a copy of that data just as it is there? And perhaps we can figure something out of it.

Page marked Complainant's Exhibit 258 for identification.

Q. Your specialty has been the manufacture of this very rich oil gas or oil and water gas, has it not?

A. Yes.

Q. And yet you cannot give us here even the candle power of that 225 feet which you used to enrich the coal gas, is that right now?

A. Well, now, there are several elements entering into consideration——

Q. I know, but can you?

A. No, I cannot, but——

4911 Q. And you cannot tell whether the 225 feet was used to enrich 775 feet of coal gas or one thousand feet of coal gas, can you?

A. Not without going into a detailed calculation of it.

Q. Do you include any superintendence in the cost of the 225 feet?

A. Well, the only special feature I have in regard to the oil gas produced is the 2 cents per thousand for repairs and I calculated the same superintendence, superintendence at 50 cents, which is excessive, would cover that portion of the oil gas, yes.

Q. How could that be, if the oil and water gas were manufactured in New York and the coal gas or most of it was manufactured in Astoria as you have suggested?

A. Well, there are $50,000, I think that would divide a man up so that he could cross the river.

Q. $50,000 have you allowed solely for superintendence?

A. Yes.

Q. Does not the $50,000 include anything else except the superintendent's salary?

A. The superintendent and his aids. It is the superintendence, including not only the general but the different assistants. I think I stated before this morning that that was quite a large figure.

Q. You have allowed for repairs to apparatus how much?

A. Apparatus and buildings 4½ cents.

Q. And you said that that was the experience of the company this past year, was that right?

A. No, I said it was a little more than they had charged up in their books.

Q. Is it not true that the cost of maintenance in a coal gas plant is substantially greater than that of a water gas plant in the way of repairs?

A. Yes, it is somewhat greater on the apparatus. The buildings would not be anything different of any account, only slightly.

4912 Q. Did you take into account the fact that the repairs and replacements of the Consolidated Gas Company for the year 1905 were abnormally small and very much less than similar expenditures for the average of the past twenty years, or didn't you?

A. I saw that——

Q. Did you take that into account in your computation?

A. I don't remember that I looked at the back years on this particular point, but I thought the figure was a large one anyhow.

Q. In comparing coke at $4.00, did you take the short ton and compare it with what the company paid for anthracite which was $4.23, in your testimony?

A. I don't remember what I said about that. I called attention——

Q. You only said it just before luncheon. Don't you remember that you did say that the company appeared to pay $4.23 for anthracite?

A. I think that was the price I mentioned.

Q. Don't you know that was a long ton and not a short ton, and therefore that the comparison was not exact?

A. Well, the tons are mentioned there indifferently, without stating whether they are long or short.

Q. You have not read the testimony, which states that the long ton is used constantly in the computations of the company, have you?

A. No, I took it as a short ton.

Q. Is it not customary to deal with coal by the long ton in your experience?

A. No, everybody that I have talked with on the subject will say a short ton in figures.

Q. If the anthracite is measured by the long ton and the coke by a short ton, a comparison would not be fair, would it, without taking into consideration the difference?

A. I took it that both of those were on the basis of the short ton.

Q. But I call your attention to the fact that the coal is a long ton and that would not make a fair comparison, would it, without taking into consideration that fact?

A. No. And also a——

4913 Q. Well, "no" is the answer. That is all the question I asked you. The coke you say could be used for the production of water gas and would be as good as anthracite, pound for pound or substantially so. Then it would be your view that the company had been reducing its profits by using anthracite at a higher price instead of coke at a cheaper price, would it not?

A. Yes, that is it exactly.

Q. You have given the cost of fuel for water gas manufacture at 2½ cents per thousand in your mixed computation, dealing with some Central Union comparisons, figuring with coal or coke at $4.20 per ton. Now, that would mean, would it not, only 13.37 pounds per thousand?

A. What figure do you refer to there?

Q. I am speaking about your water gas production which you made up in a subsequent statement here in a comparison with the Central Union coke or coal at $4.20 per ton, 2.5 cents per thousand?

A. Yes.

Q. Now, if you take coal or coke at $4.20 per ton and compute that to be 2½ cents per thousand that means, does it not, only 13.37 pounds of fuel for each thousand feet of gas?

A. Are you calculating a long ton or short ton, which do you use?

Q. Well, which did you use?

A. I used a short ton throughout.

Q. Very good, take a short ton. For a short ton it would be a little smaller?

A. Well, it would come to 4.62.

Q. It would amount to what, how much in pounds?

A. Well, you turn it around. What was the amount then?

Q. The question is whether it is not true that coal or coke at $4.20 per ton, figured at 2½ cents per thousand means 13.37 pounds of fuel for each thousand feet of gas produced on the long ton and on the short ton whether it does not mean only 11.9 pounds
4914 of fuel per thousand feet of gas?

A. Yes, I have evidently taken it on the thousand pounds. There is an error there.

Q. In other words, it is simply impossible to assume that 11.9 pounds of fuel produces a thousand feet of gas, isn't it?

A. Well, I have taken it at 22 pounds to the thousand feet, but in the calculation, in the carrying out, it was erroneous. The coal and coke is stated at 4.20 a ton, at 22 pounds to the thousand.

Q. In other words, let us put it in in another way. Did not every one of the Massachusetts companies that you mentioned before luncheon require 30 pounds or more of fuel to generate each thousand feet of gas?

A. Well, I stated over 30 pounds.

Q. And if you compute on that basis, instead of the coal and coke amounting to 2.5 cents per thousand, would it not, on a basis of 30 pounds, even, amount to more than 6 cents per thousand for fuel instead of 2.5 cents?

A. Well, in this case the gas is so much higher quality that they do not use—the higher quality you get the less fuel you have to use per thousand. It takes a less proportion of water gas and larger proportion of oil. I do not think that is out of the way, for I have used 28 pounds as I stated, I have been down as low as 28 pounds of coal to a thousand in Danbury, only running half a day.

Q. Do you mean to advance the proposition then that 11.9 pounds of fuel will produce a thousand feet of gas or generate it?

A. No, I say it is 22 pounds.

Q. Then instead of being 2.5 cents it should be on the basis of 22 pounds how much?

A. A short ton, 4.62.

Q. Instead of 2.5?

A. Yes. If the figure is carried out.

4915 Q. Have you got any allowance for boiler coal in your cost of production? You have only mentioned what was used under the generators?

A. No, I omitted the boiler coal.

Q. Now, you use from 12 to 15 pounds of boiler coal don't you per thousand?

A. No.

Q. How much?

A. It depends upon the scale, all the way from six or eight pounds to twenty pounds according to the scale of operation.

Q. Don't you know that where you use coke instead of anthracite coal that the capacity of the machine is much less, say, sixteen to twenty?

A. The capacity of the machine is less. I so stated. That is, that you had to run slower.

Q. Now, I understand you to say that in this computation you have produced or assumed to produce a gas at 22 candle power at the works?

A. 23.1.

Q. In your Central Union computation you say you took one-half coal gas at sixteen candles and one-half water gas at twenty-eight candles and the average is exactly twenty-two, is it not?

A. Well, that is Central Union, but I have allowed here a larger amount of oil than at the Central Union, five and one-half gallons in place of 5.05.

Q. Did you not allow five and one-half at Central Union?

A. No, 5.05 is the amount which the Central Union used.

Q. In comparing with the Central Union so far as you did compare, taking up that second computation, you got an average of exactly 22 candle power at the works for coal gas at sixteen candles, half coal gas at sixteen candles and half water gas at twenty-eight candle power?

A. No, that would be——

Q. Exactly twenty-two, would it not?

A. Twenty-two candles, yes, sir.

Q. You did not make any allowance for the candle power 4916 which must be maintained above 22 candles in the mains at least a mile from the works and maintained at such a margin that never in any instance would the candle power fall below twenty to twenty-two candles a mile from the works?

A. I intended to make an allowance of twenty-three candles at the works, that is true.

Q. But you overlooked that in your final computation, did you not?

A. By raising the candle power of the coal gas I thought it would bring it to above twenty-two; it brings it to twenty-two.

Q. Did you make any allowance in taking your Central Union figures for the fact that the Central Union statement from which you took those figures covered only four months of the twenty-two candle power rate and eight of twenty candle power?

A. Well, in calculating their figures out——

Q. Did you make an allowance for that?

A. Yes—I made the calculation here which I stated this morning of 23.1 candles.

Q. Central Union?

A. Yes, sir, on the whole. I took 670,000,000 of coal gas at 14 candles and 925,000,000 — at twenty-five ¼ candles.

Q. But you stated in your direct examination that you mixed one-half coal gas at 16 candies with one-half water gas at 28 candles?

A. That was the change I proposed. This Central Union figure is based on 925,000,000 of water gas and 670,000,000 of coal gas, just as they actually make.

Q. Then that is not the computation which you have given us on the record this morning, is it?

A. No, that is simply to ascertain the quality of the gas.

Q. I am talking about the computation which you placed on the record this morning. You did take half coal gas at 16 candles and half water gas at 28 candles?

4917 A. I intended to make a computation of half coal gas and half water gas, that is about the same as the Central Union, it is not exactly, it is more coal gas and less water gas.

Q. Where would you get your 16 candles out of coal gas when it only yields about 14 candles?

A. The idea — to restrict the use of coal gas to a lower point.

Q. I know, but where do you get your 16 candles in your coal gas when you have stated it only makes about 14 on the average?

A. If you restrict the yield on the average somewhat you can get 16 candles.

Q. You can get less gas per ton of coal?

A. Yes.

Q. Then you would have to have more tons of coal proportionately to produce that amount of gas, would you not?

A. Yes.

Q. But you did not use an[illegible] more tons of coal in your computation per thousand of gas, did you[illegible]

A. I took the coal gas as the previous computation——

Q. In other words, in getting the cost of the coal gas that you mixed with the water gas, you took the computation concerning which I previously examined you?

A. Yes.

Q. And you did not take any greater number of tons of coal to get this coal gas per thousand feet that you did in your first computation, did you?

A. No, I omitted to add for the enriching or for the 16 candle power coal gas, that is true.

Q. And also the cost of your coal gas in this Central Union comparison, contains the same errors as to value of residuals and so forth, which the computation in the previous case incorporated, does it not?

A. Well, no, it——

Q. Does it not? Did you not take exactly the same figure, starting with fuel and labor, less residuals, 6.5 cents? Was not that the first item in the production of your coal gas?

4918 A. I took the net cost of the coal gas of the Central Union or very close to it, the Central Union item for net cost was 6.64 cents.

Q. Did you not say coal gas as before?

A. I think I did. I might say substantially net as before, or the same as Central Union. I do not see any essential difference, a small fraction of a cent.

Q. I want to know whether the figures you took for the labor and material, 6½ cents in this Central Union comparison, was taken from the Central Union statement or whether it is, as you have stated, the same figures which you employed in your previous computation, which you pointed out were erroneous in some particulars?

A. It is neither. It is midway between; it is a compromise. That is, this Central Union figure was 6.64 and my previous computation was 6.46, and this is 6.50.

Q. Then your total Central Union ideal computation, as I will call it, producing a certain result, you proceeded to compare with the cost of the gas to the Consolidated Gas Company for the year 1905. Did you observe that the cost to the Consolidated Company covered the calendar year 1905 and therefore six months of the twenty-two candle power requirement, while the Central Union figures only covered four months of the twenty-two candle power requirement and two-thirds of the twenty candle?

A. Yes, I had it down for a difference in oil for that reason of .6 of a cent.

Q. Did you also take into consideration the testimony of the Central Union officers that they did not maintain in The Bronx during the first eight months of this period even the twenty candle power required by law?

Mr. Page: I do not think they stated that. I have just 4919 read it, so if Mr. Mathewson is to testify, I would prefer he would read from the testimony on the record.

Mr. Mathewson: It has been spread upon the record.

Mr. Page: I know, you have spread it several times.

Mr. Mathewson: It has been read verbatim.

Mr. Page: They said they tested it at the works and not farther away and that they maintained sufficient candle power at the works——

Mr. Mathewson: And they were asked if it did not mean something less than that somewhere else, and they said it did.

The Witness: If it gets richer in the pipes like in the case we had the other day——

Q. Perhaps it does. It must have, if they met the law. Well, I will ask you if you took into consideration the fact moreover that the Central Union Company did not maintain a mile from the works even the twenty candle power standard for the first eight months of the year ending October 31st, 1905.

A. I say I took into consideration about the candle power——

Q. I know you said you took into consideration one thing, but I ask you if you took into consideration this question?

A. No, I do not think it was so, for the contract states they were to maintain the legal standard.

Q. What contract? You mean the statute?

A. No, the contract they make for selling gas to other companies.

Mr. Page: To the Consolidated.

Q. It appears in evidence that gas was delivered solely to lamp posts up there, so that the amount which you found was delivered by the Central Union to the Consolidated or for account of the Consolidated was extremely small, was it not, or did you not observe that? 4920

A. Yes, I noticed it was a small amount.

Q. And you observed it was delivered solely to public lamps?

A. No, I did not notice that. However, I added .6 of a cent to the computation on account of the——

Q. What was the basis of your addition of .6 of a cent, how did you figure that out?

A. In order to make the difference of oil at higher candle power, that is, I took it to be a reasonable addition to bring it on par with——

Q. Can you explain any more in detail your computation? Well, I will not press it, if you haven't it at hand. Did you not say that the .6 which you allowed this morning was for a correction for the price of oil and not for any additional enrichment?

A. I believe so.

Q. Now, which is right, your present statement that it was for additional enrichment, or your statement this morning that it was an allowance for the difference in the price of oil?

A. I think it would cover both, for .6 of a cent is a large sum, based on your output. It is $600,000——

Q. You stated this morning it was to allow for the difference in the price of oil. Was that the correct statement, or was it to allow for something else?

A. I don't remember making that statement this morning, for it was not in the other allowance, but I made it this afternoon. I see it is the second calculation here as being as it is, an amount of $60,000. I should think it would cover the difference in oil and light—as a matter of fact, I calculated the Central Union at 23.1 candles, but I see that I omitted to account for the difference between 14 candles and 16 candles.

4921 Q. That would add somewhat to the cost, would it not?

A. Yes, sir.

Q. Now, let us take the comparison with the New Amsterdam. You figured the New Amsterdam or took it from the Exhibit as 29.01 and you compared it with the Consolidated water gas station which you found 31.05. Did you take into consideration the fact that the Consolidated 31.05 was for the calendar year and covered six months of the 20 candle power standard while the New Amsterdam exhibit was for the year ending October 31st, 1905, and covered only four months of twenty-two candle power and eight months of the twenty candle power?

A. Yes, but I observe the candle power of the New Amsterdam in the tests that I was looking over by the inspectors was held up higher than the Consolidated as a general thing.

Q. Well, did you make any allowance for the additional period of twenty-two candle power which the Consolidated Exhibit covered, as compared with the New Amsterdam?

A. I think the New Amsterdam average is 23.73. I did not see the necessity of doing that.

Q. I am talking about the Consolidated. Did you make any allowance from the fact that their exhibit covered twenty-two candle power exceeding the twenty-two candle power period of the New Amsterdam?

A. They did not need it.

Q. Well, did you make it?

A. No, sir; the New Amsterdam is 23.73.

Q. You did not make any allowance for the fact that during two months of the period covered by the Consolidated there was a difference in the cost of oil by reason of the use of 34 gravity instead of 28 beginning with November 1st, 1905?

A. No, sir. As stated I did not take any stock in that gravity or difference.

4922 Q. Now, you stated that the 42d Street plant of the Consolidated showed a cost at the holder for the year 1905 of 34.87 cents and compared that with the water gas stations of the Consolidated, 31.05 cents, and you found a difference in the 42d Street cost, computed upon the output, of $48,454 and you capitalized that at five per cent. Now, will you tell me how much of the $48,454 would amount to per thousand feet of sales on the total Consolidated output of 13,283,000,000, about?

A. On the Consolidated's manufacture it would amount to about .48 of a cent, I think. Of course a larger divisor makes a smaller result.

Q. On the total sales of 13,283,000,000, which is what we are dealing with. It would be about .35 of one cent, would it not, roughly?

A. .37 I make it.

Q. Well, you then compared the New Amsterdam cost of 29.01 for the nominal year with the Consolidated Water Gas Stations and found a difference of $161,700 or thereabouts. If that be divided by the total sales that would amount to a little over one cent on all sales of the Consolidated, would it not?

A. A cent and a quarter about. That does not alter the sum they might have lost, though.

Q. You understand, do you not, that the Central Union plant is a modern, comparatively new, up-to-date plant for a mixture of water and coal gas virtually under a single roof and all the product sent out from a single plant.

A. I believe so.

Q. That, other things being equal, would tend to some economies impossible in widely scattered plants?

A. No, I think my impression is that it is a good thing to divide up these very large stations because you get some competition of management.

Q. Now Professor Bemis, in his testimony, says that putting the production into one large station like Astoria would cheapen the production. You think it would make it more expensive, 4923 do you, and that it would be advisable to have smaller plants instead of one large plant?

A. No, I think for some reasons it would be cheaper, but the competition in management of plants where they are very large is an incentive to getting a little better result.

Q. If you mix coal and water gas it is better, is it not, to have them immediately contiguous or produced in the same plant?

A. Yes, certainly.

Q. So that that element existing in the Central Union Works, that would be an element favorable to a reduction in cost where the water gas and coal gas plants are really under a single roof, would it not?

A. Not so much in cost as the certainty that a mixture could be made. I think they will have to devise some very efficient way of securing uniform gas from those two separated works, for I have seen it tried and it requires some management beside throwing the two gases together.

Q. And is there not a greater variation of candle-power necessarily to be provided for when coal and water gas are made at different plants, miles apart, and distributed in the mains as compared with the making of coal and water gas at a single station, as you might say, and mingling it at that point?

A. Yes, they should be mingled before going into the gas holders at all.

Q. If possible?

A. Yes. That can be done in this case.

Q. Now the coke in the case of a water and coal gas plant contiguous goes direct from the retorts to the generator house does it not?

A. Yes.

Q. And that saves cartage and breakage of coke, does it not?

A. It does.

Q. Did you know that the New Amsterdam plant was a new and up-to-date plant in every particuar for water gas?

A. I inferred, from its having better results, that it was 4924 either up-to-date or better managed.

Q. Well, you know that it is a new and up-to-date plant?

A. I know that it is newer, yes.

Q. And you know that the gas of the New Amsterdam Company is produced at that single plant, don't you, or is not that your information?

A. I believe so. I have not absolutely definite information on that.

Q. Now, in reference to your 42nd Street examination or the examination of the 42nd Street plant, you first went down about December 2nd, about two o'clock, did you not? And left about four?

A. I left before dark.

Q. Well, you went about two and left about four?

A. Yes, that was preliminary.

Q. And did you go more than one other day?

A. Two other days.

Q. Well, you went the next day, didn't you?

A. I think I went three days. In the first place to——

Q. Did you go more than two days?

A. Yes, I think I went three days.

Q. Sure about that?

A. Yes.

Q. Did you go with the same young man as a guide each time?

A. No, I went alone first.

Q. That was on December 3d, from two to four. Well, you went December 4th, the next day, and left about four o'clock that day?

A. I continued until after dark. I left about dark or a little before dark.

Q. Now, do I understand that in making your oil gas it makes very little difference what quality of oil you use?

A. I think there is a difference in oil, but not as regards the degree of the mixture or the average degree of the mixture. I do not see any particular difference there.

4925 Q. You mean that a low gravity oil at 28 will do just as well as 34?

A. It should do with proper apparatus and management.

Q. Then I assume you buy as cheap oil as you can, don't you, if one does just as well as the other?

A. That is the way I should do.

Q. Is that the way you do in Danbury?

A. Just as cheap as we can get it. The trouble we can't get it——

Q. The 28 gravity oil?

A. Sometimes, and sometimes it runs 34. It did run up to 34 without any request at all, and I did not notice any particular advantage in it, however.

Q. But if one oil is cheaper than another and the lower gravity oil is just as good, you naturally buy the cheaper oil, don't you, when you can get it, if there is any difference in the price at all?

A. I only learned of this new theory within the last few months.

Q. I understand, but my question is not as to that. I say you use where you can get 28 degree oil cheaper than 34, you get the 28 degree, don't you?

A. Yes, certainly, but we did not make any provisions about the exact gravity in the oil. It was to be an oil free from very heavy matter, that is all.

Q. What do I understand in Danbury you charge for the rich gas without reducing it to the 17.6 candle standard, how much does it amount to per thousand feet?

A. They have reduced it now until the highest price is $2.65.

Q. That is without reducing it to the 17.6 candle?

A. Yes, that is for 44 candles tested as we do test it. The price has been recently reduced but I am glad to say the quality is to be kept where it was.

Q. Is it not true that tar produced by different plants contains a larger or smaller proportion of water in the mixture or emulsion, if you call it so?

4926 A. It contains a little—formerly we used to get a great deal of water mixed and now they have a provision for filtering it and getting the water out.

Q. Do you know whether there is any different method for extracting the tar in the New Amsterdam works than there is at the Consolidated?

A. There must be, there seems to be some better way.

Q. Well, do you know how much the Consolidated residual differs as to pure tar from the New Amsterdam?

A. I do not—I do not from inspection of the tars; but I suppose all gas companies try to free the tar from water now so as to burn it.

Q. Would it make any difference in your opinion as to the amount of tar, if the result in candle power compared favorably per gallon of oil?

A. No, if they get as good a quality of gas I should not make any difference except that they ought to make more of that quality.

Q. Referring to this Danbury Company to which you have again referred to-day, I want to call your attention to your previous testimony as to the depth of the main. Mr. Charles H. Merritt is the president of the Danbury Company, is he not?

A. Yes.

Q. Now, will you look at this letter from Mr. Merritt (handing paper) and see whether he does not state that it is the custom of that company to have 3½ feet of dirt over the top of the pipe?

A. He may state it is the custom, but I don't think he ever looked at 10 feet of the main pipe.

Q. Well, that letter appears to be from him and he appears so to state, does he not?

A. Well, as a matter of fact——

Q. The question is, whether that appears to be a letter from Mr. Merritt, and whether he does so state in the letter?

4927 Mr. Page: What is stated in the letter I suppose appears from the letter?

A. Yes. Well, I differ from that.

Q. And does he not further state in this letter that the question was referred to the superintendent of the Danbury Company and that the information comes from the superintendent also?

A. I don't think the superintendent ever saw anything of the kind.

Mr. Mathewson: Well, I offer this letter in evidence.

Mr. Page: I object to that. If Mr. Merritt is to testify, he should appear here and be subjected to cross-examination.

Mr. Mathewson: No, you have letters here from all sorts and descriptions of people.

Mr. Page: I have not produced the letter and I object to the admission of this. It is not competent and is purely hearsay, and if Mr. Merritt is to testify we should have an opportunity to cross-examine him.

The **Master**: I will exclude it.

Mr. **Mathewson**: Exception.

Q. Does the president state, as I have stated in my question, as to the depth of the dirt over the pipes in Danbury?

Mr. **Page**: That is objected to, as having been already excluded.

Mr. **Mathewson**: I am not offering the letter again, but I am asking whether he so states.

Mr. **Page**: I object to it as being incompetent. Mr. Mathewson can read it and see whether it so states just as well as asking
4928 the witness. It does not require an expert on handwriting
to read a typewritten letter.

The **Master**: I will exclude it.

Mr. **Mathewson**: I will take the answer to the question. Exception.

The **Witness**: It so states but I do not think Mr. Merritt knows anything about it. I never saw him along the line of pipe and never saw him look at a pipe.

Q. Did you ever know the Superintendent to go over the pipes?

A. I know he looked at them all the time they were laying them, but——

Q. Does not Mr. Merritt say, "Following your inquiry of me as to the depth we laid our gas mains, to fully make sure of the proper answer the question was referred to our superintendent, who informed me the custom of this company is to have three and one-half feet of dirt over the top of the pipe.

Mr. **Page**: Same objection.

The **Master**: Same ruling.

Exception.

Q. Have I quoted correctly?

A. Yes, I know, but——

Q. Have I quoted that correctly?

A. You may have quoted it correctly, but——

Q. Well, have I quoted it correctly. Will you take the letter and let the question be read, if you have any doubt of it.

A. Yes, he so states, but——

Q. Now, you said something about Faribault, and that the pipes out there, as I recollect, were about two feet deep; at any rate, they had about two feet of covering; was that right?

A. No, sir. I said they were buried down an uneven depth, and I ordered them to be laid shallower. They were trying to lay them
below the frost line, and I found no use in that; in fact,
4929 raised them somewhat, on account of the inconvenience of
having to get down to them.

Q. Do you know how deep they are actually laid?

A. Some of the old pipes may lay deep. I did not speak in regard to the pipes laid before I went there.

Q. Are there any pipes laid three feet under ground in Faribault?

A. Yes. My directions were not to pay any attention to——

Q. I have a letter here which appears to be from the Secretary of the Faribault Gas & Electric Company, on the paper of that company, isn't it? That is what it appears to be, is it not?

Mr. Page: I object to that.

Mr. Burr: I join in the objection.

Objection sustained. Exception.

A. Yes.

Q. Now, does not the secretary of that company say in this letter that "The writer knows of no instance where the mains are less than three feet underground?

Same objection. Same ruling. Exception.

A. Yes.

Mr. Mathewson: Have I not a right, Mr. Master, in an examination where the witness himself has referred to the depth of mains underground to call his attention to a communication from the company itself, and to ask him whether that modifies his views at all on the subject?

The Master: Yes, but if the letter is objected to as incompetent——

Mr. Mathewson: I am not offering the letter. I am merely asking the witness to identify it, and whether it is a letter from the company.

4930 The Master: I understand, but you cannot do indirectly what you cannot do directly, and get the contents of an incompetent letter on the record by cross-examining the witness.

Redirect-examination by Mr. Page:

Q. Mr. Edgerton, do you know of your own personal knowledge that pipes are laid at Faribault at less than three feet?

A. In plenty of instances. I have directed that the idea of laying pipes below the frost line be stopped, and all the pipes that I saw laid there were laid according to a given dip; sometimes they might dip; they were a depth of two feet to two and one-half feet, but it was only on account of getting grip, and furthermore, I showed the fact that we had less freezing or less services frozen on shallow pipes than the old type pipes of any one case.

Q. I think you have testified to all that. I asked merely whether you knew of your own personal knowledge that such pipes had been laid?

A. Yes, and my instructions were to lay no others, and Mr. Cowperthwait had no business to lay a pipe at any other depth.

Q. What Mr. Cowperthwait? Were they in Faribault?

A. I had charge of Faribault and directed everything that was to be done there, and I gave him specific instructions to pay no more attention to that rigamarole about deep pipes.

Q. Do you know of your own personal knowledge that the pipes at Danbury are laid at less than three feet deep?

A. I know of three miles of pipe that I laid myself that there is not a bit of it that lays over two feet below the surface of the ground, and in many other cases I have seen—walking down Main Street, I saw a pipe right opposite Mr. Merritt's house, the man that wrote that letter, right opposite his house, that was not over 2½ 4931 feet deep. I saw the men taking up what was an abandoned main, also of 3-inch pipe, which did not lay more than two feet deep, and I have looked on pipes at Danbury at dozens of times which were not three feet deep and plenty of them I have seen at two feet deep. I state that positively.

Q. In relation to the question that was asked you, whether you took the station cost of the Consolidated companies for the year 1905, and you took the station cost of the New Amsterdam and Central Union for the nominal year ending October 31st, 1905, I call your attention to Exhibit 93, which purports to be a summary of operations for the nominal year ending October 31st, 1905, of the Consolidated Gas Company, and Exhibit 94, which is a summary of the operations for the calendar year, and call your attention to the station cost in Exhibit 93, and ask you to state what it is?

A. 32.68.

Q. And for Exhibit 94, what is the station cost given?

A. 32.42.

By Mr. MATHEWSON:

Q. Gas made, in each case, isn't it?

A. Gas made, yes, sir.

By Mr. PAGE:

Q. Therefore, the year 1905 cost less than the nominal year ending October 31st, 1905, according to these two exhibits, did it?

A. Yes, sir.

Q. Now, in arriving at your result of the coal gas made according to these theories, if you increase your tons from short tons to long tons would you also thereby increase the amount of gas that you had obtained?

A. Certainly.

4932 Q. That is, the 10,600 cubic feet of gas per ton was estimated on a short ton, was it?

A. Yes, sir; 5.2 cubic feet to the pound.

Q. And a ton of 2,240 pounds would produce how much more gas?

A. 11,648; a difference of about 1,000 feet.

Q. That is the 14 candle power gas?

A. Yes, sir.

Q. So that would increase proportionately if you took a long ton and would not change the result?

A. No, sir; it would increase the proportion of coke and breeze, and also the other figures where I figured on a 2,000-pound ton; that is, it would increase the yield on the same ratio.

Q. It would increase the yield on the same ratio?

A. Yes, sir.

Q. And except in the item of coal handling it would not change your other items of expense, would it?

A. No, there does not occur to me any change that would be brought about by that changing of the ton.

Q. When you made this estimate, did you make it with the idea that it was to be applied to the existing plants of the Consolidated, or was — to be a modern up-to-date plant placed in the most convenient manner?

A. Why, I assumed that this would be a modern plant; of course it was based on that.

Q. You did not expect to save a part of the present works and modify that value, did you?

A. No, sir.

Q. Well, have you any desire or wish to modify your testimony that a modern plant could produce 22 candle power gas at twenty-four cents or less?

A. No, I think that I have made, simply in making this without having access to some of the information I desired, I have made a slight discrepancy here, and I think still that, by a careful 4933 examination, that in time to ascertain all the facts involved that gas could be made at twenty-four cents. I see that correcting my estimate to the Central Union figure it amounts now to 26.30 cents. I made this calculation on Sunday and did not have access to any large amount of information that I required. I had to be ready to put it in to-day and worked on it last night until 12 o'clock. This morning I tried to get some additional information, but I could not get at it.

Q. Will you state how these bottles of oil were marked that you brought and delivered to Professor Sherman?

A. They were brought to me from——

Q. The bottles of oil or the samples of oil, I mean?

A. I marked one "Standard Fuel Oil," that I got in South Norwalk; and the January 6th oil was from Danbury, and the November 24th oil was from a tank delivering to the Mutual on 21st Street —they said they were going after they delivered to the Mutual——

By Mr. Mathewson:

Q. Were there just three samples of this oil?

A. There were a number of other samples, but there were none of any account, there were some of the old Danbury samples brought down, extending back to 1904.

Q. Were they marked in any way?

A. They were all marked.

Mr. Kirby: These are the only three we had analyzed. If you want the others you may have them.

Q. Did you draw this sample at Norwalk yourself?

A. Yes, sir; out of the Standard oil tank.

Q. Who was present when you did it?

4934 A. The driver and the superintendent of the electric company, Mr. Winchester; I think he was there; and the engineer was there, I am certain; I am not so certain about Winchester; he came in shortly afterwards, I think.

Q. What tanks, if there is more than one tank there, did you draw it from?

A. I drew it from the tank coming from the Standard Oil Company and feeding into and delivering oil in a certain tank of the electric light company.

Q. Did you draw it from the tank of the oil company or the tank of the electric company?

A. The tank of the Standard Oil Company; and I have got a photograph of it if you want it.

Q. What sort of a receptacle was it in?

A. A long tank drawn by two horses, quite a large-sized tank.

Q. No, I mean the sample?

A. The sample was in a glass bottle.

Q. Did you draw the sample at Danbury yourself?

A. No, I have drawn a number of them; those samples, I say, extending back over——

Q. Well, did you draw this particular sample yourself at Danbury?

A. I could not tell you that. Many of those samples I drew myself and some of these other——

Q. Well, you cannot swear that this particular sample from Danbury you drew yourself?

A. No, I cannot swear to that.

Q. Then you cannot swear as to the day on which it was drawn except as somebody told you, can you?

A. No. It is labeled. I will look and see if it has my handwriting on that bottle.

Q. That would not mean that you drew it yourself, would it?

A. Yes, that would mean that I drew it myself out of the tank.

4935 Q. What about the sample of the oil in New York; where did you draw that sample?

A. I did not draw that sample; that was given to me by a man, a reliable man, who told me he drew it right out of the tank from the barge, where they were pumping up from the barge.

Q. Where?

A. At the Mutual works.

Q. Where?

A. I think it is at the foot of 11th Street; somewhere on the East Side there.

Q. Where?

A. I think it is the foot of 11th Street, somewhere on the east side there.

Q. But you have no information except what is given you by this man who informed you, is that right?

A. That is all. He told me that was drawn right straight from——

Q. Who drew it? Who is the gentleman who drew this New York sample?

A. He is an acquaintance, a friend of mine.

Q. What is his name?

A. I do not care to tell that. It is not necessary to know that.

Q. Well, I am inclined to think it may be necessary. I ask you what his name was?

A. The sample was given to me by somebody on the barge. I have forgotten the name of the man.

Mr. MATHEWSON: Do you want to withdraw that if you do not want the name given, Mr. Kirby?

Mr. KIRBY: We may produce the man himself.

Q. Well, I will ask you again to give the name of the man who drew the sample, and take the ruling, or who gave the sample to you, and take the ruling of the Master if there is any objection to it.

The MASTER: You can answer, Mr. Edgerton.

Mr. PAGE: I object. If Mr. Edgerton has any objection 4936 to giving it, I will withdraw the sample and withdraw further testimony in regard to the sample.

The MASTER: That seems to dispose of it.

Q. Now, Mr. Edgerton, in reference to the long and short tons, those producing the coal gas in your assumed plant in New York would be bituminous coal?

A. Certainly.

Q. I asked you no question about bituminous coal. I asked you if you did not compare coke at $4.00 a ton, short tons, with anthracite at $4.23 per long ton; you understood that, didn't you?

A. Yes, I understood the anthracite price was $4.23 on the short ton.

Q. You understood I asked you nothing at all as to bituminous as comparing with long or short tons, and you stated it was a short ton; that is right, isn't it?

A. I figured on short tons throughout.

Q. Now, of course the more pounds of bituminous coal you take, the more gas they will produce; that is conceded, I suppose?

A. Yes.

Q. You estimate that your computation of labor, less residuals, in the first place amounted to about 6 cents, and after you had made the corrections for residuals, the balance amounted to something like 15 cents. You do not call that a slight discrepancy, do you?

A. Well, I do after correcting the errors that I made in my prices, yes.

Q. But, as a matter of fact, the long or short ton use would not affect any errors that you made of that character?

A. Not that, but it is affected by the fact that I made an error in the prices, in referring to the prices of material here, and the Central Union, and it made quite a large difference.

Q. Now, as you have been asked further about Faribault, I read

4937 this from the letter which you have identified as a letter of the company, and ask you if that does not modify your statements as to the pipes in Faribault——

Objected to.

Q. (Reading:) "Our main feeders are in most instances from five to seven feet below the surface. In order to keep below the frost line in this part of the country it would be necessary to have pipe in no instance less than five feet. Such mains as we have at a depth of from three to three and one-half feet are in outlying districts, where the consumption is light, and are of wrought iron in every instance, so that we have experienced no difficulty with broken mains."

Now, I have quoted that correctly, haven't I?

Mr. PAGE: I object, as before.

Q. And I ask whether that does not modify your statements which you put on the record in your redirect-examination as to the depth of mains at Faribault?

Same objection. Same ruling. Exception.

A. No. I know better.

Q. And if they are three feet under ground it would indicate that they have not followed your advice at Faribault, wouldn't it?

A. They did follow my advice. I saw the mains laid there.

Q. When?

A. In 1901, 1902, 1903. I have not been there since 1903.

Q. You don't know whether they have been taken up and relaid at a greater depth or not since, do you?

A. I know that I should have heard of it.

Q. Well, except in that way, you do not know, do you?

A. Well, all communications from Faribault about management are referred to me, and have been, and up to a very recent 4938 period; and I will say this, that this young man does not know about Faribault mains to the extent I do, for he is secretary——

Mr. MATHEWSON: I move to strike out the witness' answer as not responsive.

Motion granted. Exception.

Q. Now, I ask again, you have no personal knowledge, have you, as to what mains have been taken up and relaid in Faribault within the last four years, or three years, since you were there, in 1902 or 1903?

A. Since I was there in 1903, I have not—1903? Yes. I have not paid personal attention to it, but I would know if there were any mains——

Mr. MATHEWSON: I move to strike out "But I would know if there were any mains."

Motion granted. Exception.

By Mr. Page:

Q. Do you know as a matter of fact that this oil marked "January 6th, 1905," was the oil that was being used at that time by the company at Danbury?

A. Yes, sir.

Mr. Mathewson: Objected to. Of course the witness does not know if he did not draw it and was not present when it was drawn and was not present when it was used. The man who gave it to him may have got it somewhere else. If we had been present when it was drawn I would not have the slightest objection; as it is, I must object.

The Master: I do not see how he can testify to that, if I remember his testimony rightly.

The Witness: This is not my tag.

4939 By Mr. Mathewson:

Q. Not your writing on the tag, is it?

A. No, it is one Mr. Cowperthwait put up.

By Mr. Page:

Q. Is it the custom of the Danbury company to take samples of the oil as each shipment comes in and keep them in some certain place?

Mr. Mathewson: That is objected to as immaterial.

Question allowed. Exception.

A. That is the custom.

Q. Did you take this bottle from the place where such oil is kept in the Danbury works?

Mr. Mathewson: Objected to as immaterial.

Question allowed. Exception.

A. I did not take the sample myself, no. I ordered it taken from my closet where I kept samples.

Q. Did you keep those samples yourself?

A. I kept them under my eye; they were right in the office where I did all my laboratory work, and they have, I suppose, one hundred bottles of those samples extending quite a number of years back, of oil, because I have been making it a subject of looking into oil with reference to the qualities of gas made from it for quite a number of years.

Q. You say you ordered it taken from that closet?

A. Yes, sir.

Q. Who gave it to you?

A. The son of the superintendent came up specially to bring those samples to me from Danbury, and no other person except myself or his father has access to the office that I know of where they are kept.

4940 By Mr. Kirby:

Q. This oil marked "Standard Fuel Oil," November 20th, 1906, is the oil delivered to you by Dr. Sherman, is it not?

A. Yes.

Q. And the oil in bottle marked "January 6, 1905," was the sample of Danbury oil that you delivered to Dr. Sherman, is it not?

A. Yes.

Q. It is the sample of oil you testified to getting in Danbury?

A. Yes, I took that up there personally and we tested that first with a hydrometer, Beaumé, and I directed him to make as careful a fractionation as possible, in fifths.

HENRY CLAPP SHERMAN, a witness called on behalf of the State, being first duly sworn, testifies as follows:

Direct examination by Mr. KIRBY:

Q. I understand you are an analytical and consulting chemist?

A. Yes, sir.

Q. Are you upon the faculty of any university?

A. I am upon the faculty of Columbia University.

Q. What position do you hold there?

A. Adjunct Professor of Analytical Chemistry.

Q. Have you any scientific degree?

A. I have the degree of Bachelor of Sciences from the Maryland Agricultural College, Master of Arts from Columbia University, and Doctor of Philosophy from Columbia University.

Q. Did Mr. Edgerton, the gentleman who has just left the witness stand, deliver to you certain samples of oil under seal, being the oil, some of which is in this bottle marked "Standard Fuel Oil, 4941 November 20, 1906," and the other in the bottle marked "January 6, 1905"?

A. He did.

Q. And did you make certain tests of the oil as to its specific gravity?

A. I did.

Q. Did you fractionate that oil?

A. I did.

Q. Did you make chilling tests upon the two samples to ascertain the amount of solid matter therein or to show what such tests would indicate?

A. I did.

Q. Will you give the result of the test of the oil marked "Standard Fuel Oil, November 20, 1906," as to specific gravity, the same being reduced to a Beaumé scale?

Mr. MATHEWSON: Objected to as immaterial and irrelevant; the results of such an examination not being relevant to the issues here.

The MASTER: Well, I will take it.

Exception.

A. I have the result of the density determination by means of the hydrometer on the Beaumé scale, and the results of the specific gravity determined by means of the specific gravity bottle. The results by the hydrometer were 31.3 degrees Beaumé at 70 degrees Fahrenheit, corresponding to 30.3 degrees Beaumé at 60 degrees F. The specific gravity determined at 60 degrees F. by means of the specific gravity bottle was 0.8744.

Q. Did you fractionate this oil?

A. I did.

Q. And in how many fractions?

A. Into five fractions; the first, second, third and fourth fractions being distilled; the fifth fraction being the residual oil.

Q. And what was the result of such fractionation into these five
fractions which you have spoken of, giving specific gravity
4942 by balance, by bottle and also reduction to Beaumé scale.

A. The specific gravity by the Westphal balance for the

First fraction	was	0.832
Second "	"	0.870
Third "	"	0.880
Fourth "	"	0.8855
Fifth "	"	0.899

The specific gravity determined by the specific gravity bottle was for the

First fraction	0.8321
Second "	0.8708
Third "	0.8807
Fourth "	0.8862
Fifth "	0.9007

Q. And reduction to the Beaumé scale gave what results?

A. The results shown by the specific gravity bottle reduced to the Beaumé scale gave for the:

First fraction	39.5
Second "	31.7
Third "	29.8
Fourth "	28.7
Fifth "	26.1

Q. That is, that this oil, which before fractionation in a Beaumé test of 30.3 was fractionated into five fractions in the manner you have stated, showed it to be made up of oils varying in specific gravity from 39.5 to 26.1, or to 26.1 for the specific gravity of that which was not distilled over?

A. For the gravity Beaumé corresponding to the specific gravity for that which is not distilled over.

Q. Now, did you apply a chilling test to this oil?

A. I did.

Q. To what temperature did you bring the oil?

4943 A. The oil was brought to a temperature between O, F. and minus 5 degrees F., and held at that temperature in the first test for one hour.

Q. And what was the result?

A. This sample marked "Standard Fuel Oil" showed no change in appearance, and on opening the burette in which the oil was contained during this exposure to the low temperature——

Q. Did it clog up the opening?

A. It did not clog the opening. At the opening of the burette the oil began to flow out at once.

Q. Which indicated to you what condition of the oil as respects paraffine or such other substance which might have been its base? Was much or none contained therein?

A. That there was none which we described at this temperature during exposure of one hour.

Q. Now, did you apply a similar test to the oil marked "January 6th, 1905"?

A. I did.

Q. What was the result of those tests?

Mr. Mathewson: Objected to. That is the one which the witness did not draw.

Objection sustained. Exception.

Mr. Page: We ask that this testimony be taken subject to our subsequently connecting it directly, and if we do not do so it may be stricken out.

Mr. Mathewson: It seems to me that that is not the way to produce testimony.

The Master: I think the best thing is to exclude it, and let it go at that. You can take it on that basis if you desire.

Mr. Page: I will take an exception.

The Master: It seems to me you have got to do so much connecting to make this testimony material anyway it is hardly worth while to go into it at length.

4944 Mr. Kirby: We will put it in under the rule, Mr. Master.

Q. Did you test this oil for specific gravity?

A. I did.

Q. What was the result?

A. The result of the determination of the density by the Beaumé hydrometer was 34.5 degrees Beaumé at 70 degrees F., corresponding to 33.5 degrees Beaumé at 60 degrees F. The specific gravity determined by the specific gravity bottles at 60 degrees F. was 0.8572.

Q. And the fractionation showed what?

A. Showed for fractions, specific gravity, by the Westphal balance:

First fraction	0.769;
Second "	0.850;
Third "	0.8695;
Fourth "	0.882;
Fifth "	0.905.

The specific gravity by the specific gravity bottle for:

First fraction	0.7709;
Second "	0.8514;
Third "	0.8712;
Fourth "	0.8833;
Fifth "	0.9065.

Q. Which, being reduced to the Beaumé scale, gives what result?
A. Gives for the:

First fraction	53.4	degrees	Beaumé;
Second fraction	35.5	"	"
Third fraction	31.6	"	"
Fourth fraction	29.3	"	"
Fifth fraction	25.1	"	"

Q. It also indicates that this oil was made up of various
4945 gravities, and not all of one gravity of 33½ degrees Beaumé?
A. It does.

Q. Did you subject this oil to a chilling test?

A. I did.

Q. What was the test, and what did it show?

A. The test was made in the same manner as the test with the sample marked "Standard Fuel Oil," two burettes being exposed side by side for one hour at a temperature between 0 degrees F. and minus 5 degrees F. The two burettes were of the same form and of approximately equal diameter, and filled to the same depth in one case with the "Standard Fuel Oil," in the other with the sample marked "January 6th, 1905." On removing the burettes from the freezing mixture the sample marked "Standard Fuel Oil"——

Mr. Mathewson: Do you mean that?

The Witness: I understood the object of this question was to compare the results of these two oils. On removing the burettes from the freezing mixture the sample marked "Standard Fuel Oil" showed no change in appearance and ran out freely upon opening the burette. The sample marked "January 6th, 1905" showed no deposit, but was slightly turbid, and did not run out immediately upon opening the burette, but began to run in a few seconds, as the substance became warm by contact with the air of the room.

Q. Did you make a further test of these oils by chilling them and noting the result?

A. I made a second chilling test with these two samples of oil, using the same burettes, but with the burettes reversed, that is, with the sample marked "Standard Fuel Oil" placed in the burette previously used for the sample marked "January 6th, 1905," and *vice versa.*

4946 Q. What was the result of that?

A. The burettes were then exposed to a temperature of about two degrees below zero for two hours, at the end of which time the sample marked "Standard Fuel Oil" was not perceptibly changed in appearance, and ran out from the burette in about fifteen seconds when the latter was opened at the room temperature immediately after removing from the freezing mixture. The sample marked "January 6th, 1905," was turbid, and upon opening the burette under the same conditions, the oil required a few seconds before beginning to run, and about one hundred seconds to run out completely from the burette.

Cross-examination by Mr. MATHEWSON:

Q. What percentage of oil did you get from the different gravities from 39.5 down to 26.1 Beaumé, referring to "Standard Fuel Oil"?

A. The first fraction from the Standard Fuel Oil was one-fifth of the volume of the sample taken from the fractionation.

Q. 20 per cent.?

A. 20 per cent. by volume.

Q. Very good.

A. The second fraction was also 20 per cent by volume; the third fraction was also 20 per cent. by volume; the fourth fraction was also 20 per cent. by volume.

Q. And, of course, the fifth?

A. The fifth was the residue remaining in the flask. It was impossible to pour it out so fully as to measure 20 per cent.

Q. Were these tests 39.5 to 26.1 Beaumé of the five fractions reduced to sixty degrees temperature or taken at that temperature?

A. They were taken as nearly at 60 degrees F. as tests upon small volumes can be made.

Q. Well, what do you mean by that? Didn't you take the exact temperature?

A. The exact temperature was taken at 60 degrees and the tests are the specific gravities at 60 degrees F. 4947

Q. But you separated this oil into five fractions, did you not?

A. I did.

Q. And then you took the specific gravity of each fraction?

A. I did.

Q. Isn't it necessary to know the temperature of each fraction at the time you test it in order to get the accurate result reduced to 60 degrees?

A. It is.

Q. Did you take the temperature of each fraction?

A. I did.

Q. And do you mean to say that each fraction tested just 60 degrees, or did it test some other degree at some other figure?

A. The tests were made at 60 degrees.

Q. So that there was no reduction?

A. There was no reduction.

Q. How did you know that the temperature was 60 degrees at the test? What test did you make to ascertain the temperature before taking the gravity of the five fractions?

A. The temperature was determined by means of thermometers. The temperature in the case of the determinations of the Westphal balance were taken by means of a thermometer, obtained with the balance, the whole apparatus having been tested and certified by George Westphal.

Q. What was the total material that you began with in reference to "Standard Fuel Oil"? Was it a full bottle?

A. The bottle was not completely full.

Q. How much of it have you used up?

A. I should say that the bottle contained about three times that amount.

Q. Three times what there is now in it?

A. Yes. The residue I should judge to be about one-third of the amount which was delivered.

4948 Q. What is the meaning of the tag, "Filter Before Testing," if you know?

A. Mr. Edgerton requested me to filter the oil before making the tests.

Q. Did you?

A. I did.

Q. You did not test the oil as it is in the exact shape in which it was delivered to you, then, did you?

A. The oil was filtered in the presence of Mr. Edgerton, so that the oil as finally delivered to me by Mr. Edgerton was in exactly the state in which I made the tests.

Q. Oh, yes, but this oil here does not represent the oil as it was originally brought by Mr. Edgerton, but it represents the oil after it had been filtered; is that it?

A. After it had been filtered.

Q. And this sample is after it had been filtered?

A. After it had been filtered.

Q. Was this a continuous single test reaching all your conclusions by a single sitting, so to speak?

A. Do you refer to all the results as I have given.

Q. I refer to the "Standard Fuel Oil."

A. To all of the results which I have given of the Standard Fuel Oil?

Q. Yes.

A. No.

Q. Well, give me some further detail on that, if you will.

Mr. Kirby: What do you mean.

Q. You say it was not all at the same time. Were there long intervals and, if so, what were the intervals between the different parts of your process?

A. There were intervals varying from a few hours to a few days between the different operations in the examination.

Q. Were your samples kept sealed between the various steps in the tests?

A. They were kept in a locked closet.

4949 Q. Were the samples sealed or stopped, carefully stopped?

A. They were carefully stopped.

Q. With cork?

A. With cork.

Q. Can you give me the temperature of the distillation fractionating the oil into the five parts?

A. I can give you approximately the temperature at the end of the distillation of each fraction.

Q. Yes, that is what I mean.

A. Do you wish the approximate temperature at the end of each distillation of each fraction from the sample marked "Standard Fuel Oil"?

Q. Yes.

A. At the end of the distillation of the first fraction the temperature was about 495 degrees F.; at the end of the second about 555 degrees F.; at the end of the third about 600 or 605 degrees F.; at the end of the fourth about 645 degrees F.

Q. Did you also filter the second sample dated "January 6th, 1905"?

A. I did not.

Q. Will you give me the percentages of each distillation thrown off by each distillation and the temperature at the conclusion of each?

A. Each fraction was 20 per cent. by volume of the sample taken for the fractional distillation, and the temperatures were, at the end of each distillation, of the first fraction about 470 degrees F.; at the end of the distillation of the second fraction about 550 degrees F.; at the end of the distillation of the third fraction about 620 degrees F.; and the end of the distillation of the fourth fraction about 668 degrees F.

Q. What do you mean when you speak of the oil handed you as being made up of a single oil or being made up of a combination of oils?

Mr. KIRBY: He has not made such a statement, Mr. Mathewson.

Mr. MATHEWSON: You asked him whether this was not a mingled oil, a mixed oil.

4950 Mr. KIRBY: I asked him whether this oil was not made up of oils of different gravities.

Mr. MATHEWSON: I think that means the same thing.

Q. What do you mean by saying this is an oil made up of different gravities?

A. I mean that the sample I tested consisted of constituents having different gravities.

Q. That does not mean that the oil, as it comes from nature, might not have different gravities when it was distilled or the fractions might not show different gravities when it was distilled, does it?

A. Will you kindly repeat the question?

Q. Does that necessarily mean when there are distillations showing different gravities that it is a mixture of five oils, artificially produced?

A. It does not necessarily mean that it is an artificial mixture, if that is an answer to your question.

Q. It may be a natural product as it appears?

A. Certainly.

Q. In other words, the mixture might have been done by nature instead of by man, for all the distillation shows?

A. It might.

By Mr. KIRBY:

Q. But it does mean, does it not, that this distillation is not all 34 degree oil?

A. Certainly. The products of the distillation are not all 34 degree oils.

By Mr. **Mathewson**:

Q. Taking the oil as it stands, "Standard Fuel Oil," it does mean that the oil as you tested it, after filtering, showed 30.3 Beaumé at 60 degrees?

A. 30.3 Beaumé at 60 degrees F.

4951 Q. And the other 33.5 degrees Beaumé at 60 degrees?

A. Yes, sir.

Q. Will you give me the length of time that the distillation of each one of these fractions consumed?

A. No, I cannot give you the length of time consumed.

Redirect-examination by Mr. **Kirby**:

Q. In filtering this oil marked "Standard Fuel Oil, November 20, 1906," what did you filter it through?

A. Through ordinary filter paper.

Q. And what did that remove, if anything?

A. Suspended matter, and perhaps water.

Q. No constituent part of the oil itself?

A. Some of the oil remained in the filter paper, but there is no reason to suppose that it would remove more of one constituent than of the others in the oil.

Q. What was the purpose of the filtration?

A. To remove the foreign matter before testing the oil.

Q. That is, what we would com-only call dirt?

A. Dirt.

Recross-examination by Mr. **Mathewson**:

Q. And tar?

A. I saw no evidence of tar.

Q. The filter would not remove tar or any of it, would it, Professor? How is that?

A. It would depend entirely upon the conditions under which you attempted to remove the tar with filter paper.

Mr. **Mathewson**: I ask to have these two bottles marked for identification and left with the Master, subject to our inspection and testing, if we see fit.

The bottle labeled "Standard Fuel Oil, November 20, 1906," is marked for identification, Complainant's Exhibit 259.

4952 The bottle labeled "January 6, 1905," is marked for identification, Complainant's Exhibit 260.

Mr. **Burr**: I also have a couple of letters that I would like to submit to Mr. Mathewson and the Master. You will recollect that Professor Bemis testified that Lynn reduced the rate voluntarily to ninety cents, and that his information was that it had also quite recently reduced the price to eighty-five cents, he believed, October 1st.

(Mr. Burr then presented a letter on the subject and made a statement as to its contents, which, by direction of the Master, was stricken from the record on Mr. Mathewson's motion, and objection to its competency.)

Mr. **Burr**: And I except now to the striking out, and ask that this paper be marked for identification.

Marked for identification, City's Exhibit 123.

Mr. **Burr**: I have here a letter from the acting Director of the Department of Commerce and Labor, Bureau of the Census, to certify to the correctness of the statements made by Professor Bemis as regards the growth of the population of the City of New York, and in contradiction of the conclusion arrived at by the Herring-Burr-Freeman report to which Mr. Mathewson referred.

Mr. **Mathewson**: Same objection.

The **Master**: Mark that for identification also.

Mr. **Burr**: I offer that in evidence. It is an official document.

Mr. **Mathewson**: I object to it as incompetent.

Objection sustained. Exception.

4953 Paper marked for identification, City's Exhibit 124.

Mr. **Burr**: I offer in evidence the Referee's report filed in the County Clerk's office, in an action brought in the New York Supreme Court, New York County, entitled The People of the State of New York against The Union Gas Light Company of the City of New York and another; J. M. Varnum, Attorney for Receiver; filed August 7th, 1875. And I ask to have spread upon the record those parts which I have marked in the copy, which I will hand to the Stenographer. It is offered for the purpose of showing that in this proceeding the real estate and franchises of this company were valued at a certain figure, some Five Hundred and Fifty Thousand Dollars in 1875, which was much less than the value of the franchises as stated in Yalden's Report, or in the report of the Committee of 1886, Senate Document 47, I think it was.

Mr. **Mathewson**: Objected to as incompetent evidence and immaterial and irrelevant, and it relates to a corporation which was not one of our constituents.

The **Master**: I will take it for what it is worth.

4954 New York Supreme Court.

THE PEOPLE OF THE STATE OF NEW YORK
against
THE UNION GAS LIGHT COMPANY OF THE CITY OF NEW YORK and Another.

To the Justices of the Supreme Court:

I, Elias J. Beach, the Referee appointed herein by an order made by this honorable Court on the second day of August, 1875, and to whom it was by said order referred "to examine and report as to the truth of the facts stated in the petition of the Receiver of the Union Gas Light Company bearing date on the 28th day of July, 1875, and as to the nature and character of the property described in said petition, the value thereof and the advisability or inadvisability of allowing the whole of the same to be sold together by the said Receiver by private sale or negotiation" do respectfully report to this Honorable Court.

That, after having been first duly sworn, due notice of the time for the hearing of the matter so referred to me as aforesaid was given to all the parties to this action and to the creditors of the Union Gas Light Company, as appears by the notice of trial with admission of service thereon endorsed hereunto annexed and marked "Exhibit 'N' ".

That upon the time appointed for the commencement of such reference, to wit, the 4th day of August, instant, there appeared before me Mr. F. J. Fithian of Counsel for the Attorney-4955 General the plaintiff's attorney herein, Mr. J. M. Varnum of Counsel for, and in behalf of the Receiver of the Union Gas Light Company, the petitioner herein, Mr. R. M. Harrison of Counsel for and in behalf of all of the defendants herein and Messrs. Foster & Thompson of Counsel for Messrs. J. Boorman, Johnson & Company, General creditors.

That in accordance with the provisions and directions of the said order of appointment, I duly summoned before me and examined under oath in relation to the matter so referred to me, such of the officers, creditors and stockholders of the Union Gas Light Company, and such other persons as I deemed necessary and proper in order to fully satisfy and inform myself on the matters so referred to me as aforesaid, and that the names of the witnesses so examined by me are as follows:

Robert M. C. Graham, John Sickels, J. Boorman Johnston, Thomas F. Rowland, Henry Morgan, William Foster, Junior, and James M. Varnum.

That certificates under the hand of the Clerk of this Court showing and certifying that Charles Edgar Appleby had been appointed Receiver of the Union Gas Light Company by an order made herein on the 15th day of June, and that on the 16th day of June, 1875, he duly made and filed his bond as such Receiver, were produced and exhibited to me.

That the testimony of each of the said witnesses, taken under oath, was reduced to writing and duly subscribed and sworn to by each witness, and all of said testimony is annexed to this report for the full information and satisfaction of this Court, and is marked "Depositions."

That upon said reference a paper was presented to the 4956 Referee, signed by all the unsecured creditors of the Union Gas Light Company, and sworn to by them asking that the prayer contained in the said Receiver's Petition be granted; all of which will more fully and clearly appear by reference to the said paper hereunto annexed and marked "Exhibit A."

A copy of the Inventory filed by the Receiver showing the assets and liabilities of the Union Gas Light Company referred to in the testimony of R. M. C. Graham is hereunto annexed and marked "Exhibit No. 1."

And after examining the witnesses above named and taking such other and further proof as I deemed proper and necessary in the premises, and after due consideration thereon, I, Elias J. Beach, as Referee as aforesaid, do report to this honorable Court, as follows, viz.:

First. I find generally that all material facts stated in said Receiver's petition are true.

Second. I find that Charles Edgar Appleby, the Petitioner herein was on or about the 15th day of June, 1875, duly appointed the Receiver of the Union Gas Light Company of the City of New York; that he has given and filed the bond required of him as such Receiver by said order of appointment, and has in all particulars duly qualified and entered upon the performance of his duties as such Receiver, and that on or about the 28th day of July, 1875, he duly made and filed in the Office of the Clerk of this Court an Inventory of the Assets and Liabilities of the said Union Gas Light Company and that the said Inventory was just, full and true.

Third. I find that the assets of the said Union Gas Light Company consist of the following, viz.:

4957 *1st.* A block of land situate in the 12th Ward of the City of New York, bounded and described as follows: Beginning at the point of intersection of the Easterly side of the Second Avenue and the middle line of 99th Street; thence running along the said middle line of 99th Street, crossing the First Avenue to the Harlem River as laid down on Randall's Map; thence along the Harlem River as laid down on said map to the middle line of 98th Street; thence Westerly along the said middle line of 98th Street to the Easterly side of the Second Avenue; thence along the said Easterly side of the Second Avenue to the place of beginning: Together with pre-emptive and other rights in and to the lands under water in front of said premises. That upon the said land and premises buildings and works for the manufacture of gas have been commenced, but the same are now in an unfinished and incomplete state, and which buildings and works cover the greater portion of the said land and premises.

2nd. A right to lay mains and pipes in and along the streets, public avenues and other public places in and of the City of New York, which right the Union Gas Light Company has acquired and holds by intermediate assignments and transfers from the Anthracite Gas Lighting & Heating Company, to which Company and its assigns the said right and license was granted by the municipal authorities of the City of New York by an ordinance duly passed by the Common Council September 17th, 1863, and amended subsequently by the said Common Council and approved by the Mayor of the City on or about the 29th day of May, 1865.

3rd. An interest in a contract made by the Union Gas Light Company with William Foster, Junior, and certain other grantees of a grant from the State of New York, and known as, and described in, Chapter 944 of the Laws of this State, passed June 12th, 1871; by which contract the said Company undertakes to manufacture gas for illuminating purposes, and to lay mains and pipes to conduct that gas through and along streets, highways, and certain other public places, specified in that grant, which 4958 are situate in those parts of the City of New York above and north of the centre line of Seventy-ninth Street, and also in the whole of Central Park in said City.

4th. That there are also among the assets of the said Company certain unpaid cheques of Cornelius S. Bushnell amounting in the aggregate to the sum of about $17,611 81/100 (Seventeen thousand six hundred and eleven and 81/100 dollars), which are considered by the Receiver after diligent inquiry to be bad and uncollective debts.

5th. That there are also in the office of the Company at No. 1½ Pine Street certain articles of office furniture of a value not exceeding Three hundred dollars ($300).

Fourth. I find that the liabilities of the Union Gas Light Company are as follows:

1st. Judgments, being liens upon the real estate of the Company, amounting with interest to about Forty-six thousand dollars, *$46,000.*

2nd. Bonded Indebtedness and interest thereon secured by mortgage upon the real estate and franchises of the Company, apparently about Five hundred and seventy-five thousand dollars, *$575,000.*

(The full amount of this claim is not admitted by the Receiver of the Union Gas Light Company to be due, and this sum is therefore subject to reduction upon compromise or settlement).

4959 *3rd. Unpaid Taxes and Assessments* upon said real estate amounting with interest to about Eleven thousand six hundred dollars, *$11,600.*

4th. Other valid claims against the said Company unsecured by lien, about Ninety-seven thousand nine hundred dollars, *$97,900.*

5th. There is also a claim of Twenty-one thousand dollars ($21,000) made by J. B. Johnston & Company in liquidation against the said Company on account of overdue coupons, no part of which is admitted by the Receiver to be due.

That the total amount of the claims of every description against the Union Gas Light Company, not including the said rejected claim of J. B. Johnston & Company in liquidation, is about the sum of Seven hundred and thirty thousand five hundred dollars, *$730,500*

Fifth. I find that the real estate of the said Company set forth is of a value not exceeding Two hundred thousand dollars ($200,000) excluding buildings and works for the manufacture of gas thereon erected, or in course of erection; that the said works are of great extent, covering the greater portion of said property and were erected at great expense, but that the same are now, and have been for several years, in an incomplete and unfinished state, and will require a further expenditure of at least one hundred and fifty thousand dollars ($150,000) to put them in working order so as to make gas, not including the expense of laying of any mains, building fences or filling in ground, and that said works and buildings would be of but little value for any other purpose than the manufacture of gas; and that the said real estate would be but little, if any, enhanced in value to any ordinary purchaser by reason
4960 of such buildings and works being erected thereon, unless
such purchaser should desire to use the same for the manu-

facture of gas, which he would be unable to do unless he had also acquired rights and franchises for laying mains and conducting gas, &c., and it is probable that any person purchasing the said real estate for any other purposes, would regard the works and buildings thereon erected as a drawback rather than an advantage to said land, by reason of the great expense incidental upon removing them to make room for other buildings. I also find that the said property is now in danger of great waste and deterioration, by reason of the washing away by the water of the East River of the fillings of the bulkhead erected upon the water front of said premises, which washing away, if suffered to continue much longer, will entail very large expense upon the owners of said property for necessary repairs to said bulkhead and the filling behind the same.

Sixth. That, the value of said land would be much greater to any person acquiring also the rights and franchises of the Union Gas Light Company, and especially as the large expenditures heretofore made for works and manufactures would then be of use and importance to the person or persons so acquiring it. That the value of the rights and franchises owned by the said Company hereinabove set forth apart from its real estate, cannot be exactly nor approximately ascertained by any ordinary method of computation and is incapable of estimation, but that their relative value is in a great measure dependent upon the ownership of land and gas works which could make them of pecuniary value and use, nor would such incorporeal rights and franchises be of any considerable or appreciable absolute value to any person or persons not also acquiring
4961 the land and appurtenances.

Second. And I find that the said real estate with its appurtenances, and the said rights and franchises of the Union Gas Light Company, are so united as a whole and each part so depends upon the others for its relative value that a sale thereof separately and in portions would not realize as large a sum as a sale of the same in entirety, and I therefore report that it is advisable that the said real estate and franchises of every nature should be sold together by the said Receiver.

Eighth. And I find that if the said property and franchises were sold as a whole in entirety at public auction or vendure, there would be great danger and hazard, by reason of the peculiar character of the property, as hereinabove set forth, that it would be sold at a sacrifice and for much less than could be realized at private sale, and that the bidders would probably be so limited, as to practically defeat the purpose of a public auction, and I therefore report that it is advisable for the interests of all parties that the Receiver should be allowed to sell the whole of the said property together by private sale or negotiation, subject however to the approval of this Court.

Ninth. And I further find and report the probable value of the whole of the real estate and buildings and works thereon erected, and the rights and franchises of the said Union Gas Light Company, if sold together, would be about the sum of Five hundred and twenty-five thousand dollars ($525,000), which would be a just and fair price therefor.

4962 *Tenth.* And I further find that the property and estate of the Union Gas Light Company are constantly decreasing in value, by reason, not only of the damage being done by water to the real estate, as above set forth, and of the injury to the works and machinery by the weather, but also by reason of the interest constantly accruing upon the large indebtedness of the Company, and of the necessary current disbursements for the care and protection of the said property; and I also find that the mortgage bondholders threaten a foreclosure of the mortgage upon the said property and franchises unless some action is speedily taken towards the payment of the said indebtedness, and that one of the judgment creditors has advertised the said property for sale under an execution under his judgment and that the same will be probably sold upon the 19th day of August, instant, unless some settlement is made prior thereto; and that if such sale be made under foreclosure or at sheriff's sale, great loss and injury will be likely to accrue therefrom to all other persons being creditors or stockholders of said Company; and I therefore find that the allegations contained in the Receiver's Petition, as to the necessity and desirability of having such sale effected without unnecessary delay, are true.

And in recapitulation I would briefly report the following as my

Conclusion

upon the matters referred to me, viz.:

First. That the material facts stated in the Receiver's Petition are true.

4963 *Second.* That the nature and character of the property of the Union Gas Light Company is as set forth in said Petition (except as hereinbefore noted).

Third. That is is advisable for the interest of all parties that this Court should allow the real estate with the buildings and appurtenances and all the franchises and incorporeal rights of every kind of the said Union Gas Light Company which are the subjects of legal sale and transfer, to be sold together by the Receiver.

Fourth. That it is advisable for the interests of all parties that this Court allow such sale to be made by the Receiver by private sale or negotiation, but subject to the approval of this Court, and that such sale should be carried out without unnecessary delay.

Fifth. That the probable value of all of said property does not exceed Five hundred and fifty thousand dollars ($550,000) and that a just and fair price therefor would be about the sum of Five hundred and twenty-five thousand dollars ($525,000).

Sixth. That the Receiver of the Union Gas Light Company should be authorized and directed by this Court to negotiate a contract for the sale and proper transfer legally of the real estate, buildings, works, incorporeal rights and franchises of every kind of the said Union Gas Light Company of the City of New York, which are the subject of legal sale and transfer, and that such a sale be negotiated for the highest possible price, but not for less than the sum of Four

hundred and seventy-five thousand dollars ($475,000), with-
4964 out the further direction of this Court, and upon such terms
as are likely to effect the true interests of the Bondholders and other creditors and of the Stockholders of the said Union Gas Light Company, and that such negotiation be undertaken without unnecessary delay, and that the same, if any be effected, be, with its particulars, forthwith reported to this Court in accordance with the rules and practice thereof.

All of which is respectfully submitted.

New York, August 7th, 1875.

ELIAS J. BEACH, *Referee.*

* * * * * * *

Testimony of R. M. C. Graham, who being duly sworn, testified as follows:

I am the President of The Union Gas Light Company. I am also a Creditor of the Corporation to the amount of about $60,000—am familiar with the character of the property of the Corporation. It consists of the following items or particulars. I have before me a copy of the Receiver's Petition in this proceeding and have read over the several specifications therein contained and each of them and am personally acquainted with each of the specifications therein stated and know each and all of them to be true, and if I should proceed to give other or independent evidence on these points, it would be merely a recapitulation of the statements contained in that petition which I now adopt as a part of my testimony.

* * * * * * *

I have before me a copy of the Receiver's Inventory which covers not only the assets, but also the liabilities of said Company, as shown
by Schedule A, which schedule gives an accurate statement
4965 of the claims and liabilities of said Company and I desire to
make that schedule a part of my testimony.

Q. What do you estimate or consider the reasonable value of the Real Estate franchises and contract specified in the Petition provided you deem yourself competent to make an estimate?

A. The Real Estate with the franchises and the contract and specified as 1st, 2nd, 3rd in list of assets in the Receiver's Petition. If taken together are worth in my judgment the sum of $575,000. If these properties were divided and sold separately the whole would not be worth near as much as I have named. The buildings are only suitable for Gas purposes and the buildings and land as now situated becomes much more valuable by having the franchises connected with and covered by the same ownership. If the land and buildings as they now are were sold separately, there is great danger that the whole Real Estate with the buildings such as they are would not bring more than the bare land, the value of which would be about $200,000, and if any increase for the buildings could be obtained it would be small. I do not deem myself competent to fix any value on the franchises or contract. They are of such an exceptional nature depending upon so many extraneous circumstances that I would not be willing to fix any value on them.

Q. Have you considered the question as to the advisability or inadvisability of allowing a sale of the Real Estate franchises and contract together as one property by the Receiver and if so please state any fact or matter relating thereto?

A. I have considered that question and devoted considerable time upon the investigation of that subject and have sought the aid of gas experts and am satisfied that the best interests of the Stockholders, Creditors and all interested parties would be materially promoted by authorizing and allowing the Receiver to make sale 4966 of the whole property, with the franchises to one purchaser and I can perceive many advantages that might accrue by permitting the Receiver to negotiate or contract for a private sale of this property. I have considered the question of a sale by auction and think that more of sale would be hazardous as there might be little or no competition. There is a large amount of interest constantly accruing against the Company with Taxes and Water Rates and a very considerable expense for watching, protecting and the preservation of the property. One of the Bulkheads or rather the Bulkhead on the North side of the property has broken ground and is washing away; unless soon repaired very large injury will be likely to be done to that portion of the property filled in.

R. M. C. GRAHAM.

Subscribed and sworn to before me this 4th day of August, 1875.

ELIAS J. BEACH, *Referee.*

* * * * * * *

Testimony of James Boorman Johnson, who being duly sworn testified as follows:

I am a member of the firm of J. Boorman Johnson & Co. in liquidation and as such a Creditor of the Union Gas Light Company on account of money loaned and advanced to such Company amounting to about the sum of $56,000.

* * * * * * *

Q. What in your judgment would be the value of the Real Estate belonging to this Company without reference to the franchise or the particular buildings now on said land?

A. From $150,000 to $200,000.

4967 Q. What would be value of this property as a whole, taking in the building works, franchises and all as one property for the purposes of carrying on the business interest on this property?

A. Between $500,000 and $600,000, I can place no separate value on franchises but know that much money has been expended in the buildings, fixtures and appurtenances for the manufacture of gas. I am also a stockholder to the amount of 187 shares.

* * * * * * *

Testimony of John Sickels, who being duly sworn, testifies:

I am the secretary of the Union Gas Light Company and also a Stockholder and Creditor of such Company. I am well acquainted with its assets and liabilities and have read the foregoing deposition of Mr. R. M. C. Graham the President of such Company and have a personal knowledge of each of the statements therein contained and such deposition is in all respects true, and I concur in the views and opinions therein expressed, not only for the reasons therein stated but for others, and I hereby adopt such deposition as a part or portion of my own.

JOHN SICKELS.

Subscribed and sworn to before me this 4th day of August, 1875.

* * * * * * *

4968 Testimony of Thomas F. Rowland, who being duly sworn, testified:

I am the owner of the Continental Iron Works at Greenpoint, L. I., and have been and am largely engaged in the manufacture of gas machinery for companies in New York, and familiar with the value of all Gas Works. Have been engaged in that Department for the past eight years. I am the owner of about 900 shares of the capital stock of Union Gas Light Company. I constructed the building and works of that Company so far as they have progressed. I stopped work there about the time of the Panic, about the Fall of 1873, and the Company since then has not been in a condition to resume operations. The buildings and works aside from the land have so far cost about $890,000, but the machinery is much injured by rust and otherwise and has largely depreciated in value. The works as they now stand would not be of any value to a purchaser except to be used for Gas Works. It would cost about $150,000 to perfect the works and put them in a proper condition for work—this does not include the filling-in of ground, the building of any fences or the laying of any mains.

I think it would be very hazardous to sell this property at auction or to sell the Real Estate separately or the franchises separately, but that all this property should be sold together as one property and as necessary for one enterprise.

I think it would be most conducive to the interest of creditors, stockholders and all parties concerned to authorize the Receiver to negotiate for a private sale of this property together.

I think the sum of $500,000 would be a favorable price at this time and I would advocate a sale at that price if no better one could be obtained.

4969 The works will naturally and necessarily depreciate in value provided they are not completed and put in operation. I mean the machinery and appurtenances.

THOS. F. ROWLAND.

Subscribed and sworn to before me this 5th day of August, 1875.
ELIAS J. BEACH, *Referee.*

Schedule B.

Assets of the Union Gas Light Company of the City of New York.

I.

Real Estate.

A block of land in the 12th Ward of the City of New York, bounded southwardly by 98th Street, northwardly by 99th Street, westerly by the Second Avenue, and easterly by the East River or Harlem Branch thereof, with all water or other rights appurtenant or appertaining thereto; being property conveyed to the said Union Gas Light Company by Cornelius S. Bushnell and wife, by deed dated Dec. 6th, 1871, and recorded Feb. 15th, 1873, in Liber 1190 of Conveyances, page 64; together with the buildings and works for the manufacture of gas thereon erected, which latter are in an incomplete and unfinished state.

II.

Personal and Other Property.

1. Certain franchises or rights to lay mains in streets, avenues, &c., in the City of New York, acquired by the Union Gas
4970 Light Company by intermediate assignment from the Anthracite Gas Lighting & Heating Company, to which and its assigns the said right and license was granted by the municipal authorities of the City of New York, by an ordinance passed by the Common Council September 17th, 1863, and amended subsequently by the said Common Council and approved by the Mayor of the City of New York on or about the 26th day of May, 1865.

2. An interest in a contract made by the Union Gas Light Company with William Foster, Junior, and certain other grantees of a grant from the State of New York, and known as, and described in Chapter 944 of the laws of this State, passed June 12th, 1871, by which contract the said company undertakes to manufacture gas for illuminating purposes, and to lay mains and pipes to conduct that gas through and along streets, highways and certain other public places specified in that grant, which are situate in those parts of the City of New York above and north of Seventy-ninth Street and also in the whole of Central Park in said City; which contract bears date February 25th, 1874.

Mr. Burr: I understand it is not necessary, although the complainant has offered various statutes, to offer them. The Court will take judicial notice of them.

The Master: Yes, if they are public statutes.

Mr. Burr: Particularly those which we have referred to in our pleadings, such as the act against monopolies, the act forbidding discrimination against the City and several others.

Also I desire to say that we have submitted to Mr. Mathewson copies which we have procured from Messrs. Boardman, 4971 Platt & Soley of the certiorari proceedings which have been heretofore offered and testified to by Mr. Carter, for the purpose of enabling him to see whether the quotations and extracts from such papers to which Mr. Carter's attention was called were true and correct extracts from the original papers.

I also offer in evidence the so-called Remsen Gas Bill, to which reference was made in City's Exhibit 55 and regarding which a stipulation has heretofore been entered into and entered on the record of this hearing, the stipulation reciting that that bill was defeated and that no subsequent legislation was passed in this State; so that the Court may be informed of the nature of the Remsen bill, which is referred to simply in that statement as "The Remsen Bill." It being entitled "An act to amend Chapter 338 of the Laws of 1892, entitled 'An act to authorize the East River Gas Company of Long Island City to supply gas and electricity in the City of New York,' so as to authorize the said company to lay and maintain mains and pipes in that portion of the Borough of Queens included in the former city of Long Island City."

Mr. MATHEWSON: I do not think it is of the slightest importance and relevancy and I object to it. It never becomes a law.

Mr. BURR: In other words, the point I want to make by the introduction of that bill is this. That whatever remedy was sought to be applied to the existing conditions or conditions as they then existed was not applied because the bill failed to be approved by the Governor and that the condition that then existed still continued to exist, whatever that condition may have been, and they 4972 were careful to say that Exhibit 55 clearly and truly stated the attitude of the gas company at that time.

The MASTER: I think that is rather ancient history, Mr. Burr. I will exclude it.

Mr. BURR: It may be ancient, but it may also be very material.

The MASTER: I do not think it is material and I will exclude it.

Mr. BURR: Exception. That is all the evidence which the defendant, the City of New York, can offer to-day. At the same time, I wish to apply for an extension of time, and I want to call the Master's attention to the situation as it exists here at this moment. In the decision of Mr. Justice Lacombe——

The MASTER: There is no use of spreading any long motion of this kind on the record because I advised Counsel over a week ago that I could not grant any further extension, and that is the end of it.

Mr. BURR: I am not going to spread any long statement on the record.

The MASTER: I understood you were about to review the situation and make some motion.

Mr. BURR: No. I want to state my position in just a few words. I say Mr. Justice Lacombe in his decision says "Under the authorities in fixing the rate to be charged for 'public service' by private corporations two elements of calculation are of fundamental importance. What is the true present value of the property embarked in the enterprise? And what, in view of the risks of the business, is a fair annual percentage of return thereon."

We have not now before you what in our estimation is the true present value of the property embraked in the enterprise, 4973 by reason of the fact that we have been unable to complete the examination of the plants of the Company——

I want to say also that this is not due to any neglect on our part. This is a case of vast importance and through no fault of our own the engineers that were employed by the State were not accepted and that should not place the City of New York in the position which it evidently does by reason of the fact that without a further opportunity we will be deprived of an opportunity to examine the remaining plants. This is a great case, involving as the Judge says, a little later on in his opinion, the interest of—he says, "This Court fully appreciates the importance of a prompt disposition of this cause, which not only presents questions of grave importance, but which also (including the other causes heard at the same time) affects the interests of nearly half a million of households." Under those conditions, unless it fairly appears that we have been guilty of laches or neglect, it seems to me a short adjournment or extension of time for the purpose of enabling our engineers, who have been testifying right up to this present moment, to have further opportunity to examine these plants for the purpose of testifying as to their present value, which seems to be thought of importance in Judge Lacombe's opinion, would be a serious position in which to place the defendants, and would be, in my opinion, a substantial denial of justice.

Furthermore, to-morrow I expect to have some testimony with regard to the question of oil. The witness will be here in the morning, I am informed.

Mr. Mathewson: It does not appear that the City has 4974 engaged any engineers at all. The State engaged engineers.

Mr. Burr: It does appear that Doctor Marks has already examined the 14th Street station and has testified that he has——

The Master: I do not care to listen to any further discussion on this subject. If you have any further evidence, produce it. If not——

Mr. Page: Do I understand that the Master rules that we cannot make an application?

The Master: Not at all, but having called attention to the fact that an elaborate argument of a motion was not necessary, and Mr. Burr assuring me that he did not intend to make any, he thereupon proceeds to go on and make one, after which Mr. Mathewson naturally insists upon his right to reply, and then I suppose Mr. Burr will want to be heard again, and then I suppose you will want to be heard, and I want to give you all notice now that it is useless.

Mr. Page: I thought your remark was being addressed to me, because I was about to say something.

The Master: I was talking to Mr. Mathewson and not to you.

Mr. Page: I would like to get the application on the record,

without making any elaborate argument or statement, that as appeared from the testimony of Mr. Edgerton to-day, he had been engaged in the examination of the plants and had completed the physical examination of the 42d Street plant and could complete the examination and be ready to testify as to the details of all within ten days; that the condition which has arisen, as the Master knows, has arisen since he made his announcement that he would not grant the extension, and that the engineer whom we had employed
4975 and who had made the examination failed to give us the results that we had employed him to give—I do not mean in amounts but as to the methods of computation; and that we having been engaged and having Mr. Edgerton on the stand up to to-day, I would ask for an extension of ten days, that is for us, and at the end of the ten days, if the extension would not be granted, we would be enabled to produce that evidence at that time; further that the sample of oil is now in the hands of a chemist and an oil expert, the sample of oil that was produced here, and we would like an opportunity to put in the results of that examination which is being conducted to-day and that we had supposed would be completed in time to put in to-day.

The MASTER: That application I will deny. If, for the purpose of straightening up this oil question or closing up any other matter that you have unfinished, Mr. Mathewson chooses to let either of you gentlemen use any of the time allotted to him for rebuttal, that is another matter; there is no objection, as far as I am concerned, to that. If, however, he wants all of his time for rebuttal and objects to your putting in any further evidence after the expiration of the time which is now expiring, why, that would seem to dispose of it.

Mr. PAGE: I feel under the circumstances that the importance of the evidence to the defendant, and the fact that this case has been tried more rapidly than any equity case that I know of, involving anything like the issues involved here, and that we have been diligent in proceeding from day to day; that it is a matter that should rest with The Master, and that we should not be thrown on
4976 the courtesy of adverse counsel. It seems to me that the denial of this right be an exercise of power which The Master should not assume the responsibility for.

The MASTER: You understand, gentlemen, I have no power to dispose of the matter finally. My only function is to certify to the Court my own opinion about it from my supposed familiarity with the progress of the case from day to day. There is nothing to prevent your applying to the Court for an extension of time on such papers as you may determine and making such representations as you think will appeal to the Court for that purpose. It may well be, in view of what Mr. Burr states about the further extension and what you state about your oil question——

Mr. PAGE: My application is also for a further extension.

The MASTER: It may be on those grounds the Court will see fit to give you further time. But so far as my personal feeling about certifying a further extension is concerned, my position was taken several days ago and I have not seen anything to change it, more especially as some part of this evidence seemed to me of very doubtful materiality at best; some of these comparisons of other oils around here and all that, unless further connected than the evidence is now, seems to me to be of very doubtful materiality.

Mr. Page: I agree with you on that proposition, and it was to connect that that we wished to put in this analysis of the oil that they are actually using. As far as the oil is concerned, I 4977 think that the evidence we have produced unless connected more closely, will not be of much weight.

The Master: It seems to me, as far as my attitude was concerned, you knew this oil question was in the case months ago. You had the contract, and had the oil question before me months ago and claimed they were paying too much for the oil; and if you wanted to make an examination, you had months to do it. It did not depend upon the examination of the plant or anything else, you could have produced all this oil testimony weeks ago as well as you could on Saturday and to-day. As to the question of the inspection of the plants, I have gone over that again and again. The application was made to Judge Lacombe as early as August for an inspection of the plants and you gentlemen did not see fit to press it, and from my standpoint the defendants have been guilty of laches in this matter. I have certified all the extensions of time that I am willing to. In view of my instructions received from the Court repeatedly to speed this cause, I took considerable responsibility the last time in giving a much longer extension than any the Court gave during the summer; and as I told you, I cannot in justice to myself certify any further extension under these circumstances. But there is nothing in that fact to prevent you gentlemen making such application as you may be advised to the Court.

Mr. Burr: I think the testimony of all the witnesses we have called shows we have not been guilty of laches or negligence but we have been working night and day to present the case within 4978 the time fixed, and it has been in the preparation for the presentation of testimony that a great part of the time has been taken up. The complainant did not bring its case until it was entirely ready. You remember how they denied us the right to look at the plants, and yet one of the great questions in this case is what is the present value of the plant; and we did not get at that until we started in with the defense. Mr. Mayer's testimony is that he took seven weeks night and day with a large force of assistants——

The Master: I have decided it, and you might talk here for two weeks and I would not change my opinion.

Mr. Burr: I simply stated that in view of the statement that we were guilty of laches. We have all been working as hard as we could.

Mr. Page: I will take an exception.

Mr. Burr: I will also take an exception. I understand then, that as far as the defendants is concerned, our case is ended. We have no further opportunity to put in any further testimony except by permission of the Court.

The Master: Nothing except by permission of the Court, unless you want to sit this evening, which I do not want to do very much, unless you do.

Mr. **Burr**: Then the other side starts in to-morrow with their rebuttal?

Mr. **Page**: I suppose, Mr. Mathewson, that you will extend your grace and courtesy far enough—there are a number of exhibits that have been prepared by the Consolidated Gas Company, and I am not sure, without going through and checking up, as to whether those exhibits have all been put in evidence or not. If any exhibit prepared by the company that we desire to be put in evidence is found, I suppose you will have no objection, will you? 4979 & 4980

Mr. **Mathewson**: No, I do not think so, Senator. I cannot imagine that I would. I do not want to stipulate absolutely, but you show them to me and I will decide.

The **Master**: Put them in *nunc pro tunc*.

Mr. **Page**: Yes, because some of my originals have been carried off and copies left in their place, and I had to go over them and check them.

Mr. **Burr**: When do we proceed again?

The **Master**: When do you want to go on with your rebuttal? You have fifteen days as I recall it. You can take some of that in resting up, if you like, or go on to-morrow.

Mr. **Mathewson**: I shall hardly be able to go on to-morrow. There are a great many exhibits which are voluminous and I have had no opportunity to look at them while this case has been going on. I think I ought to have a week to prepare. I will ask until Thursday morning, and if I am able to proceed then I will do so; if not, we can ask for a further adjournment. If I am able to proceed then, I will. I am anxious to begin and finish as early as it is possible. If I find I am unable to do so, I can ask for a further adjournment, if that meets with the Master's views. If the Master has any engagements or plans which would require time on his part, that is something, of course, that Counsel would consider.

At 6 P. M. adjourned to Thursday, December 13th, 1906, at 10:30 A. M.

Last Exhibits:

Complainant's, 269.
State's, III.
City's, 124.

4981 Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,

vs.

JULIUS M. MAYER, as Attorney General of the State of New York; WILLIAM TRAVERS JEROME, as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIAN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and THE CITY OF NEW YORK, Defendants.

Before Arthur H. Masten, Special Master.

NEW YORK, *December* 17, 1906.

Met pursuant to adjournment.

Present: The Master, Mr. Page, Mr. Kirby, Mr. Burr, Mr. Mathewson, Mr. Garver.

4982 The MASTER: You may note on the record that the last hearing was adjourned until Thursday, December 13th, 1906, at 10.30 A. M., and was then further adjourned by me, on account of other engagements, until this morning.

I have received this morning from Judge Lacombe the following memorandum with directions to place it on the record:

"United States Circuit Court, Southern District of New York.

CONSOLIDATED GAS COMPANY

vs.

MAYER, Attorney-General, THE CITY OF NEW YORK, and Others.

LACOMBE, *C. J.:*

Upon application by defendants for extension of time to complete proof, the Master is directed to make the following disposition:

The taking of all testimony is suspended until Wednesday, December 26th, on which day the defendants may put in the testimony of

A. The witnesses (2) who obtained certain samples of oil and brought them to the chemist.

B. Mr. Stillwell, who made analysis of oil, and

C. Two witnesses to testify to grade and value of oil.

The direct testimony of A., B. and C not to exceed one day.

4983 On Thursday, December 27th, the defendants may examine on the direct such witnesses as they may call 'to close up loose ends of incomplete testimony.'

On January 3d defendants may proceed to examine.

A. Witness Edgerton; B., Witness Marks: as to value of plants 21st Street, 42d Street, Inwood, 99th Street, 44th Street, 111th Street, 122d Street, Chelsea.

The direct examination of A and B, however, shall not occupy more than three days.

After the close of defendants' case the plaintiff may have four days before beginning rebuttal.

This may be entered on record.

E. H. LACOMBE."

The **Master**: I will say for the information of counsel that it may be necessary for me to apply for a modification of these directions, because, supposing that the rebuttal would proceed this morning and be completed before January 1st, I have already an engagement to sit in another case of considerable importance, three days, January 2, 3 and 4. If counsel in that case are ready and expect to proceed I shall have to ask for such modification of this order as will leave me free on January 3d and 4th, instead of proceeding as herein directed. If, however, the counsel in that other case are not ready, or want an adjournment, then I shall proceed as herein directed.

Mr. **Burr**: There is no 122d Street plant; that should be 132d Street, I think.

The **Master**: If it is agreed it may be so entered on the minutes.

The change is consented to.

4984 The **Master**: So in accordance with that direction, the hearing this morning will be adjourned to December 26th, at 10.30 A. M.

Mr. **Garver**: The Judge seems to have failed to have taken down the names of the witnesses who are to be called. I think it is only fair that we should know who those witnesses are, as we may want to have some rebuttal on that point.

Mr. **Page**: You will have four days from December 26th until January 6th for that; you can get your rebuttal ready in that time.

Mr. **Burr**: I cannot say who the persons are I will call on that point.

Mr. **Garver**: For instance, "two witnesses who obtained certain samples of oil"; you know who those persons were?

Mr. **Kirby**: They were simply messengers, that is all. What their names are, whether Jones, Brown or Smith, I do not know.

Mr. **Garver**: And the two witnesses to testify to the grade of oil?

Mr. **Burr**: I said I would have one from New York and one from Philadelphia, but I do not know their names.

Adjourned to December 26th, 1906, at 10.30 A. M.

Last Exhibits:

Complainant's, 260.
State's, III.
City's, 124.

4985 Circuit Court of the United States, Southern District of New York.

Consolidated Gas Company of New York, Complainant,
vs.
Julius M. Mayer, as Attorney General of the State of New York; **William Travers Jerome**, as District Attorney of New York County; **Frederick E. Gunnison**, **John C. Davies**, and **Lucian L. Shedden**, Constituting the New York State Commission of Gas and Electricity, and **The City of New York**, Defendants.

Before Hon. Arthur H. Masten, Special Master.

New York, *December 26th*, 1906.

Met pursuant to adjournment.
Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Kirby.

4986 **Albert E. Winchester**, called as a witness in behalf of the defendant, the State of New York, being duly sworn, testified as follows:

Direct-examination by Mr. **Kirby**:

Q. Where do you reside?
A. At South Norwalk, Conn.
Q. Are you connected with the electric light company there?
A. The Municipal Electric Works.
Q. What is your position with that company?
A. General superintendent.
Q. As such do you have charge of the purchasing of oil, and are you familiar with the price you pay for the same?
A. Yes, sir.
Q. Are you acquainted with Mr. Henry H. Edgerton, the witness who has appeared in this case?
A. Yes, sir.
Q. Did you meet Mr. Edgerton in South Norwalk on December 5th of this year?
A. I believe it was that date.
Q. Do you purchase your oil from the Standard Oil Company?
A. Yes, sir.
Q. What is the kind of oil which you purchase?
A. Fuel oil.
Q. Where is this oil delivered to you and how?
A. It is delivered by tank wagons in our storage tank at the works.
Q. And it is delivered each day?
A. Generally speaking, yes, sir.
Q. What exception would there be from daily delivery?
A. Very stormy days and Sundays and holidays.
Q. Was December 5th a very stormy day or a Sunday or a holiday?

A. I think not; a pleasant day.

Q. What was the price you paid for this fuel oil?

4987 Mr. MATHEWSON: Objected to as immaterial and irrelevant.

The MASTER: What is the object of this?

Mr. KIRBY: We have put in evidence here the testimony of Mr. Edgerton to the effect that he obtained from the works of the Municipal Electric Works at South Norwalk a sample of fuel oil and brought the same to New York and delivered it to Dr. Sherman, and the testimony of Dr. Sherman who made the acknowledgment thereof as to what that oil consists of, as shown by chemical analysis. Mr. Winchester told us that they purchased their oil from the Standard Oil Company, and that it is delivered to them at their works, and now I ask him what the price is they pay for that oil under their contract, and it tends to show from that and the other testimony that the Consolidated Gas Company is paying too much.

The MASTER: I will allow it.

Mr. MATHEWSON: Exception. I should like to ask whether the witness has the entire contract here.

The WITNESS: What is that?

Mr. MATHEWSON: Have you the entire contract with the Standard; is it in writing?

The WITNESS: We have a contract in writing, yes, sir.

Mr. MATHEWSON: Have you got it here?

The WITNESS: I have it not here. I have no right to carry documents which belong to the municipality.

Mr. MATHEWSON: I shall object.

4988 Q. Your contract calls for fuel oil?

A. Yes, sir.

Q. And no other specification is mentioned in this?

A. No, sir.

Q. What is the price you paid for it.

Mr. MATHEWSON: Objected to.

The MASTER: As I stated the other day, it seems to me it is very open to question as to whether it is proper testimony in any aspect. Now the least you can do is to let Mr. Mathewson get his objection on record.

Mr. MATHEWSON: I object to the witness giving the terms of this written contract. What the terms or qualifications are may have a very material effect.

The MASTER: I do not understand he is undertaking to do that. I will let him testify to any matter he has any knowledge of. If he knows what the oil is and what he pays for it, he may testify.

Mr. MATHEWSON: Exception. May it be stricken out that it contained such a stipulation and nothing else?

The MASTER: Yes.

Mr. KIRBY: That was brought forth by your objection——

Q. Do you know how much you pay for this oil?

A. Yes.

Q. How much is that?

A. 3¾ cents a gallon.
Q. Do you know what you paid for this oil prior to October 25 last?
A. Prior to October 2d?
Q. Prior to October 2d.
A. 3¼ cents.

Cross-examination by Mr. Mathewson:

Q. Can you procure a copy of this contract?
A. I might be permitted to.

4989 Mr. Kirby: The Standard Oil Company has the contract.

Mr. Mathewson: What is that? We are not the Standard Oil Company. I don't know whether we could get a copy of them.

Q. Will you produce a copy of that and send it to your counsel for submission to me?
A. If it is required, of course, I will do the best I can. I don't know whether it is a proper thing for us to allow a city document to pass out of our hands or not.
Q. Well, a certified copy of it, if you can?
A. I will endeavor to do so.
Q. Did you see Mr. Edgerton strain this oil or anyone else strain this oil, the sample of which was taken?
A. I saw no oil strained.
Q. Where was the sample taken which Mr. Edgerton took away?
A. I believe it was taken when the oil was being delivered in the tank.
Q. Where, at your place?
A. Yes.
Q. Was it taken from the tank wagon or after it got into your tank?
A. I understand it was taken from the tank wagon.
Q. Did you see it taken?
A. No, sir, I did not.
Q. Has the Standard Oil any tank near South Norwalk?
A. Yes, they have a distributing station.
Q. How much do you use in the course of a year of that oil?
A. Well, that is problematic; we are using, perhaps, in the neighborhood of 440 to 450 gallons a day.
Q. Do you mean on an average?
A. I think so. Our load is such that it is rather a difficult statement to make. The average commission from one part of the year to the other——
Q. Can you not give us a general idea of how much you use in a year?
A. I can guess, I guess.
Q. Give us the best view you have on that?
A. You will understand, of course, this is merely an estimate.

4990 Q. Yes.

A. I should say in the neighborhood of 150,000 gallons a year, estimated.

Q. Do you find the use of that more economical than the use of coal?

A. Yes, sir.

Q. What sort of coal do you refer to?

A. Any coal that we are able to procure.

Q. Can you use either soft or anthracite coal?

A. Yes, sir.

Q. For what quality of oil does your contract call?

A. I am not an oil expert.

Q. I understand, but you merely mean to say that you get gas oil at 3¼ to 3¾ cents?

A. I said fuel oil.

Q. Fuel oil, I mean.

A. Yes, sir.

Q. You don't know whether the oil runs even in gravity or not?

A. No, sir; I look for results.

Q. For use as fuel?

A. Yes, sir.

Q. You don't know whether there is anything in the contract with reference to gravity, or what the provisions are, but merely that it is fuel oil?

A. To the best of my belief, it is not stipulated as to what the gravity shall be.

Q. How do you determine that this is more economical than coal for use as fuel, and what are the comparative results?

A. We are producing something that we sell.

Q. Yes.

A. We have to know something in regard to the cost of that production; we have the two, we have the steam on the one hand and the oil power apparatus or oil engine on the other, and compare the two; the cost is approximately about fifty per cent. of that of steam.

Q. Fifty per cent. of that of steam?

A. Yes, generally speaking.

Q. Using what kind of coal under the boiler?

A. Bituminous coal.

Q. At what price?

A. At $3.50.

4991 ARTHUR DE FOREST COWPERTHWAITE called as a witness in behalf of the defendant the State of New York, being duly sworn, testified as follows:

Direct-examination by Mr. KIRBY:

Q. Where do you reside?

A. Danbury, Connecticut.

Q. You are the son, are you not, of the superintendent of the Danbury and Bethel Gas & Electric Co.?

A. Yes, sir.

Q. Are you acquainted with Mr. Edgerton, a witness who has appeared in this case?

A. Yes.

Q. Did you, in pursuance of a request of Mr. Edgerton, go to the works of the Danbury Company on December 5th or 6th, and there obtain a sample of oil and take it to Mr. Edgerton in New York?

A. Yes, sir.

Q. Just tell us where you went to, what you got, and what you did with it?

A. I went to the office of the works and unlocked the cabinet where the oils are kept and transferred the oil into other bottles and labeled them as I transferred them as they were labeled on the bottle; then I wrapped them up and brought them down to Mr. Edgerton, and took them to Mr. Edgerton at the Murray Hill Hotel.

Q. From whom did you obtain the key to unlock the cabinet?

A. My father, Mr. George E. Cowperthwaite.

Q. Did you take a sample from a bottle marked January 6th, 1905?

A. I did.

Q. (Handing bottle.) And is this the bottle to which you transferred part of that oil?

A. Yes, sir.

Q. And is that the bottle that you delivered to Mr. Edgerton at the Murray Hill Hotel?

A. Yes, sir.

4992 Q. Such bottle being marked Complainant's Exhibit 260 for identification December 10, 1906. Did you place that tag thereon yourself?

A. Yes.

Q. And that is your handwriting?

A. Yes.

Q. Did you have this bottle with you all the way from Danbury to New York?

A. Yes.

Q. Did you put anything in it?

A. Nothing except the oil in the first place?

Q. You delivered it to Mr. Edgerton in the same condition as that which it was after you had placed the oil in it from this other bottle?

A. Yes.

Cross-examination by Mr. Mathewson:

Q. You did not draw this oil which you found in the bottle in the closet at Danbury from the tank yourself, did you?

A. No, sir.

Q. You have no knowledge when it was drawn or who drew it, except from the label on the bottle, have you?

A. That is all.

Q. Did you take it up and pour a portion of the bottle which you found in the closet carefully into this bottle marked Complainant's Exhibit 260 for identification?

A. I did not mark that tag.

Q. No, that is not the question.

A. I poured all the oil in the bottle that I had into that bottle.

Q. This present bottle, Complainant's Exhibit 260, contains all the oil that you found——

A. Did contain it; I don't know whether it does now or not.

Q. It did contain all the oil that you obtained from the bottle in the closet?

A. Yes.

Q. Did you rinse out the bottle in the cupboard?

A. No, not in the cupboard, it was full of oil.

Q. Did you rinse it out to get whatever dregs there might be and pour them into this bottle here?

A. No.

Q. Whatever residuum there was in the bottle at Danbury you left it there?

4993 A. I could not very well rinse it out with water; I poured it all out, there wasn't any left in the bottle.

Q. Wasn't there more oil in this bottle, Complainant's Exhibit 260 for identification, than there now is?

A. I don't remember whether there was or not, because some of the bottles were full and some were not, and I don't remember whether that one was or not.

Q. How many other bottles were there in the closet, do you think?

A. There might have been anywhere from 20 to 25.

GEORGE ELY COWPERTHWAITE, a witness called on behalf of the State, being first duly sworn, testified as follows:

Direct-examination by Mr. KIRBY:

Q. Do you reside in Danbury, Connecticut?

A. I do.

Q. Are you superintendent of the Danbury & Bethel Gas & Electric Company?

A. Superintendent of the gas department.

Q. How long have you been such?

A. Since 1880.

Q. Is it the custom of your works to take samples of oil when the same is received by you from the concern from which you purchased it?

A. We take them occasionally; we do not sample every tank, but take them at intervals.

Q. When that is taken how is it taken, and what happens to the sample?

A. The men that unload the tank fills the bottle and brings it in to me.

Q. What do you do with the bottle?

A. Why, I label it, unless he has already labeled it, and put it away.

4994 Q. Where do you put it?

A. Well, I put them in a cupboard in my office until I get it filled. Subsequent to that I put them in storage up in the attic.

Q. After it is placed in that cupboard who has access to it?

A. I do. Nobody else.

Q. Is the cupboard locked?

A. It is locked.

Q. Who keeps the key?

A. I do.

Q. Have you in any way made any changes in the oil which was placed in the bottles which were put in this cupboard to which you have made reference?

A. No, sir.

Q. Do you remember your son, who has just testified, getting the key of that cupboard from you on about December 5th of this year?

A. I do.

Q. Did he tell you for what purpose he desired the key?

A. Yes.

Q. Did he say he wanted to take certain samples of the oil there and deliver them to Mr. Edgerton in New York?

A. That was what he said he wanted them for.

Q. Did you ever receive and place in that cupboard any oils other than those which are taken from the tanks, delivered to you from the concern from which you purchased your oil?

A. That is all.

Q. From whom do you buy your oil?

A. Standard Oil Company.

Q. Are you familiar with the price that you pay for that oil?

A. Yes.

Mr. Mathewson: I object to the testimony of the witness as to the price paid for oil in Danbury on the same ground as with reference to South Norwalk.

Objection overruled.

Exception.

Q. Now, will you state what you paid to the Standard Oil Company for the oil which you used? 4995

A. 4¼ cents a gallon.

Q. You pay that to-day?

A. Pay it now.

Q. Did you pay the same price in January, 1905, as at the time this sample of oil was taken?

A. The same price.

Q. And there has been no change in price from that time until now?

A. No change.

Q. Have you any knowledge of the price which other gas companies are paying for gas oil?

Mr. Mathewson: I object to that, Mr. Master.

The Master: He can state whether he has any knowledge.

A. Yes, I have.

Q. Do you know how much the Williamsport Gas Company, at Williamsport, Pennsylvania, pays for their gas oil?

Mr. Mathewson: Of course, what they pay in Williamsport, Pennsylvania, the center of the oil regions, for oil, without any specifications of quality, degree or anything else in addition, of course, would be idle, but I would like to ask this witness a question or two as to his knowledge in advance, if you consider that as admissable on any possible theory.

The MASTER: Mr. Kirby, it seems to me that is getting a little more remote than there is any justification for

Mr. KIRBY: Notwithstanding Mr. Mathewson's suggestion that Williamsport is in the center of the oil region, I think it can be shown there is no reason why oil should be less in Williamsport than it would be in Danbury. Freight has to be paid to both points, and if Williamsport does in fact receive its oil at a lower price than 4996 Danbury there must be some other reason for it than the closeness to the oil fields; and while the testimony may not have that weight which we hope that it has, it certainly is of importance to show that the Consolidated Gas Company is paying more for its oil than the companies situated in and around New York do, and it is for that purpose that I offer the testimony.

Mr. MATHEWSON: You remember your own witness testified that transportation was 1.05 from Pennsylvania here, to say nothing of Connecticut.

The MASTER: I do not appreciate the force of it myself. You can cross-examine him for a moment, Mr. Mathewson, to see whether it is worth while to take the testimony, anyway.

By Mr. MATHEWSON:

Q. Have you ever bought oil in Williamsport recently, for use in Williamsport?

A. No oil for use in Williamsport.

Q. Have you any knowledge as to what oil sells for there, except as some person has told you?

A. No person has ever told me.

Mr. MATHEWSON: It seems to me if he has bought none himself and nobody has told him——

Mr. BURR: He may state how he knows, I suppose?

Mr. KIRBY: I will bring out how he knows all right, if I am given the opportunity.

By the MASTER:

Q. What is the source of your knowledge as to the price of oil in Williamsport?

A. I received a bill made out to the Williamsport Gas Company by the Standard Oil Company, sent to me.

4997 Q. Sent to you by mistake?

A. I think so.

Mr. MATHEWSON: I press my objection.

The MASTER: I will exclude it, Mr. Kirby.

Mr. KIRBY: Exception. I will put it in over the Master's ruling.

By Mr. KIRBY:

Q. And did you, subsequently to the time that you received that memorandum giving the price of oil at Williamsport, Pa., communicate with the works at Williamsport, Pa., in relation thereto?

A. Yes. I wrote to——

Mr. **Mathewson**: He says yes. Now, I object to any further statement. I do not think that it is material, as to what the communication was or anything about it.

Q. Did you receive any reply from Williamsport to your communication?
A. Not from Williamsport. I received my reply from the Standard Oil Company.
Q. And is it from this communication which you received from the Standard Oil Company that you know the price which was set down in that memorandum was, in fact, the price paid at Williamsport?
A. I got my information from a bill made out to Williamsport. The letter from the Standard Oil Company did not quote the price, as I recollect it.
Q. Did it deny that the price set down in that bill was the price.

Mr. **Mathewson**: Well, no matter. I object to that.
Objection sustained; exception.

Q. Is that the communication you received from the Standard Oil Company (handing paper to witness)?

4998 Mr. **Mathewson**: I object to that all as incompetent, immaterial and irrelevant.
Objection sustained; exception.

The **Witness**: Am I to answer this?
The **Master**: Yes, the answer will be noted.
The **Witness**: Yes, I recognize this as the reply I received to my letter.
Q. From whom is that letter?
A. C. M. Higgins, manager Standard Oil Company, Naphtha Department.
Q. Do you remember the price set down on the bill which you received?
A. 3.37½.

Mr. **Mathewson**: I had no opportunity to object to that before the witness replied, and I interpose an objection now, on the ground that it is immaterial, irrelevant and incompetent.
Objection sustained.
Mr. **Kirby**: Exception.
Mr. **Kirby**: I offer this letter in evidence.
Mr. **Mathewson**: Same objection.
Objection sustained; exception.
The **Master**: Mark it for identification.
The paper is marked for identification, State's Exhibit JJJ.
Mr. **Kirby**: And I also offer in evidence this bottle, Complainant's Exhibit for Identification No. 260.
Mr. **Mathewson**: I object to this bottle of oil also as immaterial and irrelevant.
The **Master**: I overrule that objection and take it for what it is

worth, without going into the question of how far it has actually been traced from the tank to this office.

Mr. MATHEWSON: Exception.

4999 Received in evidence and marked State's Exhibit KKK.

Q. Do you remember the context of the letter which you wrote to the Williamsport Gas Company which brought forth this reply, State's Exhibit for Identification JJJ?

A. I have a carbon copy of it in my pocket.

Q. What did that communication state?

Mr. MATHEWSON: I object to that as incompetent, irrelevant and immaterial.

Objection sustained.

Mr. KIRBY: Exception. I will place it in over the Master's ruling.

Q. Will you read that?

A. It is dated, "August 6, 1906, Williamsport Gas Company, Williamsport, Pa.

"DEAR SIR:

"Enclosed please find invoice of Standard Oil Company for tank of gas oil. It was mailed to us by mistake. You ought to be congratulated on the price. How did you get it? They charge us 4¼ cents. Won't you let us know the gravity of this? Where it is shipped from, and what the freight per gallon is, and oblige,

"Yours truly,

"G. E. COWPERTHWAITE."

Q. Do you know who the president of the Williamsport Gas Company of Williamsport, Pa., was, on August 6th, 1906?

A. According to Brown's Directory of Gas Companies, it was Mr. Gawtry.

Q. What was his first name, do you know?

A. I think it was Louis.

Q. Your impression is that it was Mr. Louis B. Gawtry?

A. That is my recollection.

5000 Cross-examination by Mr. MATHEWSON:

Q. You mean by that that your recollection is that that is the name you saw in Brown's Directory?

A. That is my recollection, yes, sir.

Q. What date? What was the date of this directory?

A. The last directory issued, I don't remember the date of it.

Q. Was it one issued since August 6, 1906?

A. I couldn't tell you.

Q. It covered the year 1904 or 1905, didn't it, instead of 1906?

A. Why, it would not cover 1904. It might have been 1905. It was the last directory that was issued. That is all I can answer about it.

Q. Is it one that you have up at Danbury?

A. Yes.

Q. Do you know when you bought it?

A. I could not give the date that we bought it. We take it every year.

Q. Why don't you buy your oil for less than 4¼ cents at Danbury?

A. I would like to.

Q. You have to pay whatever the Standard Oil Company charges you for it, don't you?

A. I think so.

Q. How much do you use in a year?

A. About three hundred thousand gallons.

Q. Were you present when this sample, State's Exhibit KKK, was drawn?

A. I don't know.

Q. You don't remember that you were, do you?

A. No.

Q. Do you know whether it was drawn from the top or the bottom of the tank?

A. I do not.

Q. Do you know whether it was drawn from the wagon that delivers it, the tank wagon of the Standard Oil Company, or whether it was drawn from your own tanks?

A. Ordinarily they take it from the company's tank. I did not see it taken.

Q. From the Danbury Company's tanks?

A. No, from the Standard's tank.

5001 Q. Has the Standard a tank at Danbury?

A. There is at the time they are unloading one, there is a tank car.

Q. Oh, from the tank car, or from the tank wagon, which?

A. Car; railroad car.

Q. Do you know Captain McKay of Boston?

A. I do.

Mr. Kirby: I object. This is not proper cross-examination of this witness.

The Master: I do not know that from anything that appears yet. It may be very material. I will allow it.

Exception.

Q. Do you know he has been consulted in reference to various matters in reference to the Danbury work?

Same objection. Same ruling. Same exception.

A. Yes, sir.

Q. Within how many years past?

A. I think he has been consulted this year.

Redirect examination by Mr. Kirby:

Q. I have been handed a list or a directory of directors in the city of New York. I see under the name of Louis B. Gawtry, 4 Irving Place, "Williamsport Gas Company, President and Director." That is the same name which you made reference to, is it not?

Mr. **Mathewson**: I object to the question. That is secondary evidence of the poorest kind, even if it were material, it seems to me.

Objection sustained.

5002 Mr. **Kirby**: Exception. Now, you may answer.

A. That is the same name.

Recross-examination by Mr. **Mathewson**:

Q. And you observe that the date of this edition was April 1st, 1906, do you not, of the directory of directors?

A. April 1st, 1906.

Henry H. Edgerton, recalled on behalf of the State.

Direct examination by Mr. **Kirby**:

Q. On the day which the witness Kirby has testified that he brought two cans of oil from the works of the Consolidated Gas Company to his office at No. 2 Wall Street, did you pour out from the can, the cork of which was marked A, a certain portion thereof into a bottle, and did you subsequently deliver that bottle to Mr. Albert G. Stillwell, the gentleman sitting in the back of the room here?

A. I did.

Mr. **Mathewson**: Hadn't you better identify that by the Exhibit number?

Mr. **Kirby**: The same being State's Exhibit BBB, December 8, 1906.

Q. And the sample which you delivered to Mr. Stillwell was in the same condition as that when you drew it from the can which Mr. Kirby handed to you?

A. Yes, sir.

Cross-examination by Mr. **Mathewson**:

5003 Q. Did you pour it from the top of the bottle which you gave him, or from the top of the sample which Mr. Kirby gave you?

A. I poured it from a tin can, the first that came out.

Q. Where did you deliver it to Mr. Stillwell?

A. I think at his office at 36 Gold Street, if I recollect.

Albert G. Stillwell, a witness called on behalf of the State, being first duly sworn, testifies as follows:

Direct examination by Mr. **Kirby**:

Q. Are you a chemist?

A. I am.

Q. Are you a graduate of any scientific school?

A. I am.

Q. Of what school?

A. Columbia University; the school of Applied Sciences.

Q. You hold a degree from that school?

A. Yes; Bachelor of Science.

Q. Are you at the present time carrying on a laboratory in the City of New York?

A. I am.

Q. What is the name of that laboratory?

A. Stillwell Laboratory.

Q. As such are you one of the official chemists of the produce Exchange in this city?

A. I am.

Q. Do you know the name of the other chemists that hold the same position?

A. Yes.

Q. What is that name?

A. Stillwell & Gladding.

Q. Were you formerly connected with that concern?

A. I was.

Q. When with them, and as such, have you made analyses of oil, and particularly of gas oil?

A. I have.

Q. From the Texas and other oil fields?

A. Yes.

Q. Did Mr. Edgerton, who was just upon the witness stand, deliver to you a certain sample of gas oil?

A. He did.

5004 Q. And did you make an analysis thereof?

A. I did.

Q. And did you come to certain conclusions from that analysis as to whether or not such oil was from the Pennsylvania oil fields?

A. I did.

Q. And is the result of that analysis and your conclusions therefrom set down in this statement which I hand you?

A. It is; they are.

Mr. Kirby: I offer such statement in evidence, or rather, it may be incorporated in the testimony as an answer of the witness.

Mr. Mathewson: It seems to me that the statement presented incorporates some conclusions and statements on which the witness has not been shown qualified, but as it is in convenient form I won't object to it on that ground, provided it may be understood that I do not waive objections [illegible] ncompetency.

The Master: You had better take it and then you can cross-examine on it.

The Witness: The result of my analysis, and my conclusions therefrom, is as follows:

Certificate of Analysis of a Sample of Petroleum Gas Oil Marked S. T., Received from H. H. Edgerton, 12/13/06.

Analysis.

Specific Gravity of Oil at 15.50 C. 0.8535 equal 34 Baume, using table given by Sadtler in Industrial Organic Chemistry.

Distillation in fractions of 20 per cent.

	1st.	2nd.	3d.	4th.	5th.
Temp. C, to	268	268–330	330 up		
Sp. Gr.,	0.8004	0.8500	0.8620	0.8686	0.8860
Baume,	45.	34.5	32.5	31.2	28.

5005 Distillation by temperatures.

Temp., C to	150	150–300	300–360
Per cent.,	4.50 per cent.	43.00 per cent.	43.00 per cent.
Sp. Gr.,	......	0.8390	0.8700

Sulphur: 0.730 per cent. and 0.091 per cent. average 0.082 per cent.

Oil will not flow at 5 F. On warming just flows at 14 F.

Original oil shaken up with sulphuric acid is greatly decolorized and acid is darkened.

Conclusion.

In distillation by 20 per cent. fractions, the range of gravities in the various fractions indicates that the oil is a *natural* oil, or not one distillate, distilled in narrow temperature limits and having definite gravity. This is proved by the fact that the second fraction, distill-g between 268 and 330, was redistilled and all came over in same ange of temperatures.

In distillation by temperatures, the practical absence of naphtha (under 150 C.) and the absence of non-volatile tar or coke (proved by distillation of fraction left in retort to complete dryness, with no residue left) proves that this oil is a distillate taken between these two limits.

The acid test on the oil shows that the oil is not refined after distillation.

Reasons for thinking this is not a Penn. oil:

The average analysis of Penn. oil given by Stillman is as follows:

5006 Naphthas to 150 C.	16.50 per cent.
Illuminating oils, 150-300	54.00 per cent.
Heavy oils, 300 up	17.00 per cent.
Paraffin	2.00 per cent.
Tar or coke	10.00 per cent.

If we eliminate the naphtha and tar or coke from Penn. oil and compare with sample under test, we have.

	Penn. oil.	Sample.
Illuminating oils 150-300	73.47%	45.00%
Heavy oils 300 up	26.53	55.00

This shows that an oil containing less illuminating oils than a Penn. oil, or else a mixture of oils has been used.

The sample tested smells of sulphur, while Penn. oil on best authorities obtainable should have none or at most but a trace.

Sample tested by analysis shows 0.082 per cent. sulphur.

A test for sulphur in a crude oil would show higher than in a distillate, as the sulphur hangs back in the higher boiling fractions.

Peckham in Report of Production, Technology and Uses of Petroleum states that sulphur in Penn. oil is very low.

Watts Dict. of Chemistry states that sulphur is absent in Penn. oils. The sulphur in Ohio oil averages 0.50 per cent.; in California is heavy; in Texas is heavy; in Louisiana, 0.36 per cent.; while in oil from Pennsylvania districts, comprising Pennsylvania, Western New York, West Virginia, and Southern Ohio, it is absent or at most only present in traces.

The conclusion reached by above tests on this oil is, that it is not a straight Penn. oil, but a mixture of Penn. oil with oil from other districts.

A. G. STILLWELL.

5007 Cross-examination by Mr. Mathewson:

Q. What do you mean in this statement by the expression "original oil shaken up with sulphuric acid is greatly decolorized and acid is darkened?"

A. Some of the oil was put into a test tube and shaken up with a small percentage of sulphuric acid.

Q. Some of this particular oil?

A. Of this oil, yes. By "original" I mean in its original condition as distinct from one of the distillates.

Q. When you distill oil for a certain period with rising temperature you throw off a certain portion of the oil between the two temperatures, do you not?

A. Yes.

Q. And it may be that taking a 34-degree oil you will throw off certain products by distillation between certain temperatures that will test 40, and other products 34 and others 28 degrees, and so on?

A. Yes.

Q. They averaging 34?

A. Yes.

Q. Now, you can take any one of those fractions and re-distill them, can you not, taking the 28-degree fraction, for instance, and you may get some oil which will test 34 and other oil which will test 28 and others, 23, in the same fraction?

A. You would possibly, but with qualifications—limits.

Q. Yes, of course, within certain limits.

A. I mean limits as to temperature.

Q. But as you take each fraction produced by an original distillation and distill those fractions you will from each get a production of a higher and lower degree?

A. Oh, yes.

Q. Than the gravity of the fraction which you are testing?

A. If there was much range of temperature in the original distillation from that fraction.

Q. And you can continue to re-distill fractions even obtained from the second distillation, with similar results, within 5008 certain limits?

A. They would be decreasing all the time.

Q. But you would not get a uniform gravity?

A. Not absolutely.

Q. And in order to get an oil which would not by distillation result in additional fractions of higher or lower degree you would have to distill and re-distill and re-distill again almost without limit, wouldn't you?

A. No, it could be limited in the first distillation by controlling your temperature, that is, limited within very small limits. You never can re-distill an oil of a certain fixed gravity and get an absolute definite gravity for the whole of the oil that comes over as you can with water, for instance.

Q. And then you would have to take a fraction of re-distilled oil, and then you would get results within certain degrees of gravity for the fractions resulting?

A. Yes, sir.

Q. And you would have to go through that process some time and through various steps before you would get what would be called a fixed oil as to gravity, would you not?

A. You never could reach a fixed point—the only way to do it would be to limit your temperature. You cannot go by the gravity at all. An oil distilled within limits of two or three degrees temperature coming over, and if it had a fixed gravity, the distillate, that distillate re-distilled would split—there would be very little difference in the degrees of the fractions of the distillation, because it would still come over practically within those limits of temperature, but if the limits were fifty degrees, you would keep on splitting all the time.

Q. And that would continue almost *ad infinitum*, wouldn't it?

A. Yes.

Q. You speak of "average analysis of Pennsylvania oil 5009 given by Stillman." Those averages you obtain from a work or article by Stillman, do you?

A. Yes, his *Engineering Chemistry*. It is a standard article—a standard in our profession.

Q. And where you refer to Pennsylvania oils, or tests of Pennsylvania oils, in your previous statement, which has been spread on the record, you refer to Stillman's results?

A. No, I have analyzed oils that were represented to me as Pennsylvania oils. I have never been able to trace them back to there. I have such analyses and did not bring them because I did not suppose they would be competent, for that reason.

Q. But as far as your particular statement is concerned, which is your testimony to-day, where you speak of Pennsylvania you refer to Stillman's results with illuminating oils, heavy oils and so forth?

A. Oh, yes, that is Stillman's, that is continued from the first page of my statement to-day.

Q. And where you say "sample tested" you refer to the sample of the Consolidated Gas Company's oil?

A. Yes. That was the sample given me by Mr. Edgerton.

Q. And you state at the end "the conclusion reached by above test on this oil is, that it is not a straight Pennsylvania oil, but a mixture of Pennsylvania oil with oil from other districts." That I assume was your conclusion?

A. Yes.

Q. Not the conclusion of any of these books?

A. No; conclusions based on the tests and references consulted.

Re-direct examination by Mr. Kirby:

Q. Such analysis as you made on that oil which is stated to you to be Pennsylvania oil confirms the analysis of Stillwell as set down in that statement, does it not?

A. Within practical limits. From the different districts they are not absolutely the same. It is supposed to be an average from the different parts of the district. 5010

Recross-examination by Mr. Mathewson:

Q. Oil from different Pennsylvania districts differs somewhat in test?

A. Yes, oil from wells aside of each other will differ more or less.

Q. I see that no temperature is stated for the fourth and fifth distillations in your statement spread on the record. Will you explain the reason for the omission?

A. In the first place the putting down of the temperatures at all was simply for my own record; it has nothing to do with the analysis where you distill by fractions. And the reason it was omitted in the fourth and fifth was because the thermometer I had in at that time did not register over 360, I think, or 350. In a subsequent distillation you will see that the temperature has been carried out in all of the distillates.

Q. You did not take the temperature at Fahrenheit in this case?

A. No. I can convert any of those now if you want me to, if you want them in Fahrenheit, by a little figuring.

Q. Will it take you more than a moment?

A. No.

Q. Very good, suppose you do so.

(The witness now does some light amount of figuring, and then hands Mr. Mathewson a paper.)

Mr. Mathewson: I will read your answer now, as you have figured it, and you will kindly tell me if I am correct. The answer is 15.50 centigrade equals 60 degrees Fahrenheit; is that right?

The Witness: Yes.

Q. 268 centigrade equals 514.4 degrees Fahrenheit.
5011 330 degrees centigrade equals 626 degrees Fahrenheit.
150 degrees centigrade equals 302 degrees Fahrenheit.
300 degrees centigrade equals 573 degrees Fahrenheit.
360 degrees centigrade equals 680 degrees Fahrenheit?

A. Yes.

Q. When you spoke of your thermometer as registering up 350 to 360, you referred to centigrade?

A. Yes.

Mr. Kirby: Mr. Master, that is all the evidence I have to offer now. Senator Page will be here with a witness for the State at 12:30. It is now 12:10. We can either wait, or if you prefer, and if it is convenient to counsel, we might adjourn now till 1:30, instead of adjourning at 1:00 o'clock to 2:15 as usual.

At 12:10 p. m. a recess was declared until 1:30 p. m.

5012 After Recess.

Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Page, Mr. Kirby.

Henry C. Hazzard, called as a witness in behalf of the defendant, the State of New York, being duly sworn testified as follows:

Direct examination by Mr. Page:

Q. Where do you reside?

A. 196 Lenox avenue, New York City.

Q. What is your occupation or position?

A. I am a lawyer by profession; I at present hold the position of Secretary to the State Commission of Gas and Electricity.

Q. Do the various companies file with the State Commission of Gas and Electricity reports.

A. They do.

Q. Have you the statement that I asked you to prepare.

(Witness hands paper to counsel.)

Q. Have the Consolidated Gas Company and its associate companies filed such reports with the Commission?

Mr. Mathewson: I would like to know what you mean by "associate companies."

Mr. Page: Strike out "associate companies."

Q. Have the Consolidated Gas Company, the New Amsterdam Gas Company, the Standard Gaslight Company, the Mutual Gaslight Company, the Central Union Gas Company and the Northern
5013 Union Gas Company filed such reports?

A. They have not filed any such reports as I have here before me.

Q. Have they filed any reports for the year ending June 30, 1906?

A. No, sir.

Q. Has demand been made on them for the filing of such reports?

A. Yes.

Mr. Mathewson: Objected to as immaterial and irrelevant.

The Master: How is it material?

Mr. Page: It is not very material, as I see.

STATE'S EXHIBIT LLL.

Excerpts from Reports of Gas Companies for Year Ending June 30, 1906

Name.	Locality Supplied and Population.	Kind of Gas.	Cu. Ft. Gas Produced During Year.	C. P.	Gas Oil Used During Year (Gals.)	Average Cost of Oil per Gal.
Brooklyn Borough Gas Co.	31st Ward, Brooklyn, and Fish Terrace and Manhattan Terrace in 32d Ward. Population probably 20,000	Water	119,471,000	22 to 27	670,760	$0.03076
Kings County Lighting Co.	30th Ward, Boro. Brooklyn, and part of 31st Ward same Boro. Population	Coal & Water	350,647,000	22.08	1,395,488	.03125
New York & Richmond Gas Company	1st, 2nd, 3rd & 4th Wards of Boro. of Richmond. Population about 65.000.	Coal & Water	181,850,800	24	832,405	.026512
Queens Boro. Gas & Electric Co.	5th Ward, Boro. of Queens, Town of Hempstead, Villages of Lawrence, East Rockaway, Cedarhurst, Woodmere, Hewletts, Lynbrook & Oceanside. Population 8,000 to 12,000 in winter and 50,000 to 60,000 summer	Water	84,624,000	22	421,346	.0325
Binghamton Gas Works.	Binghamton & Lestershire. Population 48,000	Coal Water	20,273,100 134,587,100 154,860,200	20 to 21	487,653	.0350
Mohawk Gas Co., Schenectady	Schenectady. Pop. 58,387.	Coal Water	76,914,246 104,405,144 181,319,390	18	398,460	.0358
Power Co. Newburgh Light, Heat &	Newburgh. Pop. 26,500	Water	68,699,600	22	274,981	.0325
Rochester R'y & Light Company	Rochester and Towns of Brighton & Yates. Pop. 188,530	Coal Water	313,653,400 437,527,600 751,181,000	20	2,018,807	.035
Fulton Co. Gas & Electric Co.	Cities of Johnston and Gloversville. Pop. 28,517.	Water	79,208,400	22.43	316,808	.035

Q. Mr. Hazzard, do these reports give the population served by the various companies, the kind of gas they manufacture, whether coal or water gas, the number of cubic feet of gas produced during each year, and the candle power of gas, and the gas oil used each year, and the average cost of oil per gallon?

A. They do.

Q. What companies have you produced the reports of pursuant to my notice?

A. I have here the verified reports of the Brooklyn Borough Gas Company, Kings County Lighting Company, the New York & Richmond Company, the Queens Borough Gas and Electric Company, the Binghamton Gas Works, the Mohawk Gas Company, the Newburgh Light, Heat and Power Company, the Rochester Railway and Light Company and the Fulton County Gas and Electric Company.

Mr. PAGE: I have had Mr. Hazzard prepare a table. It would be the shortest way, probably, to put that right in if there is no objection.

Mr. MATHEWSON: You have not asked any question, have you?

Mr. PAGE: No, I submit this to you to see if you have any objection.

5014 Mr. MATHEWSON: I will not have any objection to that method, but I shall object to the information which is included there.

Q. Have you prepared a statement from these reports which you have specified, showing the details that I asked you about?

A. I have.

Q. Is this the statement that you prepared? (Handing paper.)

A. That is the statement.

Q. Is that an accurate and correct transcript from the reports of the facts therein stated?

A. It is.

Mr. PAGE: I offer that in evidence.

Mr. MATHEWSON: Objected to as immaterial and irrelevant and incompetent; incompetent, not because it is not a true copy from the reports, but that a statement by any third party to some other third party *when* we are unable to have present and cross-examine on the statement of this first third party is incomplete as against us.

The MASTER: We had that up before, and that was recognized in the case of other evidence that we allowed. Of course that is to be taken into consideration in weighing the evidence, that you have no opportunity for cross-examination.

Mr. MATHEWSON: You can very easily see that we have no opportunity for cross-examination of these people who have filed these reports.

Mr. PAGE: Quite true, but they are official reports.

The MASTER: I will take it, as I have other similar evidence.

Mr. MATHEWSON: Exception.

Paper received and marked State's Exhibit LLL.

(Here follows State's Exhibit LLL marked p. 5014*a*.)

5015 Mr. MATHEWSON: I will ask to have these reports marked for identification and left with the Master.

Mr. PAGE: These are the originals.

Mr. MATHEWSON: Then we should have copies.

Mr. PAGE: I will have copies made.

The original reports were marked Complainant's Exhibits 261, 262, 263, 264, 265, 266, 267, 268 and 269 for identification, respectively.

Cross-examination by Mr. MATHEWSON:

Q. Under the heading, "Cubic feet produced during the year," does that refer to gas made or gas sold?

A. Gas made.

Q. Is there any separate report made of gas sold in this blank, do you remember?

A. Yes, sir.

Q. Will you turn to candle power, as to the Brooklyn Borough Gas Company.

A. Page 26.

Q. I find "candle power of gas supplied to consumers, 22 to 27"; do you know whether that is a city test or whether that is at the works?

A. I know nothing more than is contained there.

Q. And this does not state, does it?

A. No, sir.

Q. I see for the Brooklyn Borough Gas Company, gas oil used during the year is stated at 670,760 gallons. Do you know what kind or grade of oil that was? Is there anything in the report which shows?

A. There is nothing in the report to show.

Q. Now take the Kings County Lighting Company, coal and water gas 350,617,000 feet; have you a record of how much was coal and how much was water gas?

A. No.

Q. And the same is true of the New York & Richmond Gas Company, it is not?

A. Yes, sir.

Q. You have no record in your report, have you, as to the method pursued in making these tests for candle power?

5016 A. Some of these records state that information very briefly; take for instance, the Newburgh Light, Heat & Power Company report, which I pick up by chance; it states that the candle power was determined by jet photometers, and the test is made hourly.

Q. There is no statement in the report, of course, of the experience of the man who made the test, even with the jet photometer, is there, Mr. Hazzard?

A. There is not.

Mr. PAGE: In the Kings County Company report it is stated by reading on the bar photometer.

Q. And in the case of the Kings County Company there is no record in the report as to who made the test, or whether the *idn*ividual who made it was experienced and competent, is there?

A. No, sir.

Q. You have the reports of a great many other gas companies in the State of New York, have you not?

A. Yes, sir.

Q. How did you come to select these particular reports to present here?

A. Well, I tried to pick out the reports of those companies operating in the largest cities in the State and producing water gas.

Q. Well, some of these companies produce coal gas as well, I observe.

A. Produce both.

Q. You did not produce the report of the Brooklyn Union Gas Company. That is the largest company except the Consolidated Gas Company in the State?

A. I did not.

Q. And the next largest city in the State is Buffalo. You have not produced Buffalo, have you?

A. The reports of the Buffalo companies are not yet filed.

Q. How about Rochester—that is here?

A. Yes.

Q. How about Syracuse?

A. The Syracuse report is not filed.

Q. Albany?

A. The Albany reports are not filed.

5017 Q. So that the largest cities have not yet filed their reports; is that correct?

A. That is substantially correct.

Q. Were you requested to bring the reports of companies which showed a low average cost of oil per gallon?

A. I was not.

Q. What was the character of the request which induced the production of these?

A. Senator Page saw me last Friday and we looked over the reports which I have brought here to-day, and possibly three or four reports in addition to these; the other reports were defective in certain respects or deficient.

Q. In that they did not show a higher cost for oil?

A. No, sir; in that they failed to show the amount of gas produced during the year, or failed to give some other information, and possibly the information in regard to the price of oil may have been higher, but I don't remember as to that.

Q. You did find in a great many of the reports filed by various gas companies throughout the State of New York that the cost of oil was higher than in any of these that have cited?

A. I have not, Mr. Mathewson.

Q. None?

A. I won't say none; in some instances they are higher; they run as high as 4.3 cents, I believe, if I remember; possibly higher, but to my memory they run as high as 4.3 cents.

Mr. MATHEWSON: Senator, there is no objection, I suppose, to my having access to the balance of these reports in the office of the Commission, is there?

Mr. PAGE: They are public records.

Q. There is no objection to that, is there, Mr. Hazzard, to our seeing them?

A. None at all, Mr. Mathewson.

5018 Q. All these reports which you have here to-day are for the year ending June 30, 1906?

A. Yes, sir.

Q. And your data taken therefrom of course covers the same period?

A. Yes, sir.

Mr. PAGE: We offer State's Exhibit ZZ for identification in evidence.

Paper marked State's Exhibit ZZ in evidence.

HENRY H. EDGERTON resumed.

By Mr. KIRBY:

Q. In making up the schedules which have been placed in evidence showing the amount of gas oil used at the Twenty-first Street Station by the Consolidated Gas Company and the candle power as recorded by the records of the company of that station, did you make schedules from the books of the company for December, 1902, December, 1904, and February, 1905?

Mr. MATHEWSON: Do I under- that the witness took these off from the books of the company?

Mr. KIRBY: Yes.

The WITNESS: I checked them off.

Mr. KIRBY: He has placed in evidence other schedules similar to these for a different period, and I intended at that time to place these in also, but I overlooked these at the time.

Mr. MATHEWSON: I do not understand quite how this witness examined our books for 1902 and 1904, which I thought were outside of the period which the Accountants covered.

The WITNESS: The book was marked as an exhibit. Those 5019 books were what we call ordinary carbonizing reports.

Mr. MATHEWSON: The books were offered as exhibits only covering the years specified, that is the nominal year and the actual year 1905, and were not exhibits at all for any other period. I do not know that there is anything here that would take much if any time to rebut, but I call the Master's attention to the fact that this is quite outside of the period covered by the exhibits or the period in which the Accountants were examining them. I do not think it should have been done.

The MASTER: Cannot it be stated in some way exactly from what books these were taken, so we will know about it?

Q. Do you remember?

A. The books are the reports of the manufacturing accounts kept at the works, as a general thing, and kept in duplicate at the central office, showing the amount of oil used, material used throughout, and the gas made, and quality of gas without any reference to the cost.

By the Master:

Q. What I want to get at is, was this the same book that contained the figures of that kind for the year 1905?

A. Yes.

Q. It contained the figures for a number of years, did it?

A. Yes, sir.

Mr. Mathewson: I offered the portion of the book in evidence as the record will show, covering the year 1905, at the conclusion of my case, so that there might be no question as to the original evidence being before the court; but the other pages were not offered at all, and they are not evidence, nor in evidence.

5020 Mr. Page: While the offer may have been limited he offered the book, he did not offer specific pages of it.

Mr. Mathewson: Yes, I did, Senator.

Mr. Page: You did not.

The Master: We have confined our inquiry with the single exception of the old real estate values, to the question of the operation for the year 1905. Now, if we are going to open up the vista of going into 1902, 1903 and 1904, at this last stage of the case——

Mr. Kirby: I am going to ask no questions about it whatever.

The Master: The trouble is Mr. Mathewson may ask questions about it, and we do not want him going into court and asking for further time on the ground that you have opened up this new subject at this late day.

Mr. Kirby: These are taken from their own exhibits in the case.

Mr. Mathewson: No, it is not an exhibit at all. On page 2217 I asked the following question:

"Q. Have you the station records of the Consolidated Gas Company for 1905, of the material used, and so forth? A. Yes."

That is the record which the witness produced.

"Mr. Mathewson, I offer in evidence the Fourteenth Street Station records, produced by Mr. Carter," I had asked him if he had produced them for 1905.

"I also offer in evidence the Forty-second Street Station record for 1905. Book received in evidence and marked Complainant's Exhibit No. 241.

"Mr. Mathewson: Of course, I only offer the year 1905.

5021 Some of these books cover a longer period, that is, some portions of them. I also offer in evidence part of the Forty second street record for 1905, which is contained in this volume." And so, while to save time at that time the particular pages were not stated, it was explicitly stated that the record for 1905 was offered only.

The Master: Under those circumstances I sustain your objection to two of these and overrule it as to the other. There is one here for

February, 1905, which I will admit, and the ones for December, 1904, and for December, 1902, I will exclude.

Mr. Kirby: We take an exception.

Statement for February, 1905, received in evidence and marked State's Exhibit MMM.

Mr. Kirby: I offer the other two, under the rule, as exhibits.

The Master: Mark the one that is admitted as an exhibit and the other two for identification.

Mr. Page: Are these excluded exhibits to be printed?

The Master: I suppose they will have to be.

Statement for December, 1904, marked State's Exhibit MMM for identification.

Statement for December, 1902, marked State's Exhibit OOO for identification.

Q. Mr. Edgerton, in your testimony of December 10th you gave the result of your computation as to the cost of a mixture of gas consisting of 775 cubic feet of coal gas of 14 candle power and 2,225 cubic feet of oil and water gas of 50 candle power, the result being a mixture which you said would give a candle power of over
5022 22 candle. In the computation, the results of which you gave on December 10th, did you use a long or a short ton of coal?

Mr. Mathewson: The witness stated he did not know whether he had a thousand feet of one kind of gas or 775 feet.

Mr. Kirby: We will straighten this all out.

Mr. Mathewson: But you said he used 775.

Mr. Kirby: Purporting to show——

Mr. Mathewson: No, he said he could not tell.

Q. Are you able to tell now whether your total at that time was one thousand feet or 1,225 feet?

A. Yes, I find the particular data as to which I was confused was as to whether 1,225 feet would give 22-candle power gas; therefore I had to look over the calculations I had made in regard to the necessary amount of rich oil gas to furnish 22-candle, and I found that it would require 225 of the thousand feet, not on the thousand feet, so that the mixture was based on 775 feet of coal gas and 225 feet of rich oil gas.

Q. But the figures which you gave were not based on a thousand cubic feet, but on 1,225?

A. They were based on—well, really on neither one; either would have required a correction to bring it to the cost of a thousand feet, for I had neglected to take into account the volume of the rich gas in the mixture.

Q. So that your mixture was not in fact one thousand cubic feet?

A. No, it was——

Mr. Mathewson: What is that?

(Question and answer repeated.)

The Witness: Well, the mixture was one thousand cubic feet, but I say I neglected to take into account the volume of the enriching gas in the calculation of the cost.

5023 Q. So that the calculation was not for a thousand cubic feet of gas of more than the 22-candle power?

A. No, not accurately stated, it was not.

Q. Have you made a computation of the cost of one thousand cubic feet of gas, 775 cubic feet of which is coal gas and 225 feet of which is oil and water gas of a candle power of 50-candles, the coal gas having a candle power of 14-candles, and the resulting mixture having a candle power of 22.1 candles.

A. I have.

Q. And in such computation, have you used the long or short ton of coal?

A. My present computation is the long ton of coal; the former computation was based on the short ton.

Q. Have you made any other changes in units or cost per unit, or cost of labor in this computation to which you are now referring from that which you gave on December 10th?

A. No, I have simply corrected the December 10th calculation for the error in regard to considering it a short ton instead of a long ton and also correcting for the volume of the enriching gas. I find, however, there is a slight difference there in the repairs to apparatus and buildings, in looking the estimate over and comparing it with New York conditions or results obtained here in New York, I considered I had got that a little too high.

Q. And you have used what figure here in place of the one you used in your former computation?

A. I used three and one-half cents at present as against four and one-half in the former computation, that is per thousand cubic feet.

Q. Does this table which I hand you show the result of your computation?

A. Yes, sir; the result of my present computation, making the corrections I have referred to, is as follows:

5024 COST OF 1000 CUBIC FT. COAL GAS—14 C. POWER.

Soft Coal, $3.20 per ton of 2240 lbs.; average yield 5 2/10 cu. ft. per lb. = 11.648 cu. ft. per ton coal.

S. R.

Cost for coal = 3.20/11.648 = 27.45	27.47
Cost for unloading = 11.2/11.648 per ton, .961	.961
Cost for labor, gas-making and purifying:	
Cost labor per ton .522c. 4.48	4.48
Cost Supervision—Supt. and foreman	.50
Cost repairs to apparatus, building	3.50
Cost purifying material lime, 56c. per bu. 23 M. c. f. per bu.	.75
Cost purifying material—Oxide	.25
Cost for oil and waste and sundries	.37
Cost for water	.17
Cost for general expenses at works	.50
	38.951

Less residuals—	lbs.		
For 66% coke and breeze	1478		
Less 20% for firing retorts	295.6		
	lbs.		
Salable	1182.4		
		¢	
@ 4.00 per ton 2000 lbs.	2.3648	20.31	
	11.648		
Tar 13.45 gallons @ 5c		6.72	
Ammonia liquor 56/11.648		4.80	
		31.83	31.830
Cost			7.121

5025 COST OF 1000 FT. OIL AND WATER GAS, 50 C. P.

Oil, 888 gals. at 4.23	37.60
Gen. coal at 4.36 per long ton, using 20 lbs. per M	3.87
Boiler coal, 6 lbs. per M	1.16
Labor	1.78
Lime	.75
Oxide	.25
Oil and waste	.37
Water	.17
General expense	.50
Repairs	1.50
Sup.	.50
Cost	48.45

COST OF MIXTURE OF 775 CU. FT. 14 C. P. COAL GAS AND 225 FT. OF 50 C. P. OIL AND WATER GAS.

(Such mixture giving 1000 cu. ft. of 22.1/10 c. p. illuminating gas).

1000 cu. ft. of 14 c. p. coal gas costs	7.121
775 cu. ft. of 14 c. p. coal gas costs	5.5187
1000 cu. ft. of 50 c. p. oil and water gas costs	48.45
225 cu. ft. of 50 c. p. oil and water gas therefore costs	10.901
Total cost of 1000 cu. ft. of 23.1/10 c. p. mixture	16.419

The WITNESS: The change from short ton to the long ton involved several corrections in regard to the yield of tar and coke. In fact, it made a difference in the quantities throughout. It
5026 may be affected by the difference in the weight of a ton of coal.

Q. Do you consider this mixture of 775 cubic feet of 14-candle power coal gas and 225 cubic feet of 50-candle power oil and water gas as one which is practical to be made, do you not?

A. That represented in my opinion the extreme—the best results that could be obtained by combining water gas and coal gas—oil gas and coal gas, yes.

Q. Have you also made a computation, having all the corrections throughout, of a mixture of 500 cubic feet of 16-candle power coal gas and 500 cubic feet of 28-candle power oil and water gas, the mixture making in your opinion a gas of over 22 candles?

A. Yes, sir, I have.

Q. And is this statement the result of your computation?

A. Yes, sir.

Q. What do you find the result of that computation to be?

A. I find the same to be as follows:

COST OF 1000 CU. FT. COAL GAS 16 C. P.

Soft coal $3.20 per ton of 2240 lbs.
Average yield 4.75 cu. ft. per lb.
= 10640 cu. ft. per ton.

Cost for coal = 320/1064 =		30.08
Cost for unloading 11.2/10640 =		1.053
Cost for labor, gas-making and purifying—		
Cost labor per ton	$.522	
Cost labor per 1000 cu. ft. 522/10640 =		4.91
Cost Supervision—Supt. and foreman		.50
Cost repairs to apparatus and buildings		3.50
Cost purifying material—Lime, 56c. per bu.—23 M. cu. ft. per bu.		.75
Cost purifying material—Oxide		.25
Cost for oil and waste and sundries		.37
Cost water		.17
Cost for general expense at works		.50
		42.083

5027

Less residuals—

	lbs.	
For 66% coke and breeze	1478	
Less 20% for firing retorts	295.6	
Salable	1182.4	
At $4 per ton 2000 lbs =	2364.8	
Per M. cu. ft. gas made =	$\frac{23648}{10640}$	= 22.220
Tar 15 gals. per long ton at 5c. per gal. = per M. c. f. =	$\frac{75}{10640}$	= 7.049
Ammonia liquor, 56c. per ton = per M. c. f.	$\frac{56}{10640}$	= .5263
		34.532
Cost		7.551

COST OF 1000 CU. FT. OIL AND WATER GAS 28 C. P.

Oil 5.5 gals. at 4.23	23.265
Gen. coke at 4.48 per long ton, using 22 lbs. per M	4.400
Boiler coal, 6 lbs. per M	1.160
Labor	1.780
Lime	.750
Oxide	.250
Oil and waste sundries	.370
Water	.170
Gen. expense	.500
Repairs	1.500
Supervision, etc	.500
	34.645

5028 COST OF MIXTURE 500 CU. FT. 16 C. P. COAL GAS AND 500 CU. FT. 28 C. P. OIL AND WATER GAS.

(Such mixture giving 1000 cu. ft. of 24 c. p. illuminating gas, 2 c. p. extra due to lime purification).

1000 cu. ft. of 16 c. p. coal gas costs	7.551	
500 cu. ft. of 16 c. p. coal gas costs		3.7755
1000 cu. ft. of 28 c. p. oil and water gas cost	34.645	
500 cu. ft. of 28 c. p. oil and water gas cost		17.3225
Cost of mixture		21.0980

Q. I notice that in this computation for this mixture you use more oil for the thousand cubic feet of water gas than you did in the other mixture, the other mixture being 50-candle power oil and water gas. Why do you use more oil in this mixture?

A. Well, I think that it requires more oil to bring water gas to the standard than it does coal gas.

Cross-examination by Mr. Mathewson:

Q. I find that the page of your memorandum book, Complainant's Exhibit 258 for identification, is headed "Based upon enriched coal gas, with only cost of coal gas—improved works;" is that right?

A. Yes; that was a mere memorandum for myself.

Q. I understand, but that contemplated therefor enriched coal gas made by improved works under the assumed conditions which you testified to, didn't it?

A. Yes, sir.

Q. Now let us look at your testimony to-day in comparison with
your figures given at that time and appearing on that page of
5029 your memorandum book. You figured then, you say, the
short ton?

A. Yes, sir.

Q. And you have bituminous coal at $3.20 per ton?
A. Yes.

Q. I see that you still keep $3.20 per ton as the price for coal, although you have increased the amount to 2240 pounds; is that correct?

A. Yes, sir.

Q. Well, if a short ton of coal is worth $3.20 at that time, a long ton of 2240 pounds would be worth something more than 10 per cent. additional, wouldn't it?

A. Yes, but I took this price per ton from the Company's—from what the Company paid, and as they buy by the long ton I did not increase it, naturally. I saw I had made an error in taking their price based on a short ton, and we are used in the West to basing everything on a short ton.

Q. Well, you have the yield per ton in your statement as 10,600 feet, while in your present statement you give the yield as 11,648 cubic feet per ton. How is that?

A. Well, that is simply due to the increased number of pounds. That is 2240 pounds. That is about the same yield per pound; I think it was 5.2.

Q. That was with the oil added, wasn't it?

A. No, that was just the——

Q. Wasn't that after the addition of the oil gas at Twenty-first street?

A. No, coal alone.

Q. Did you find any such record in the Company's statement that it would average about 11,648 cubic feet per ton?
A. Yes.

Q. From their coal?
A. Yes.

Q. Do you mean to say that was the Company's average, 11,648 feet per long ton?

A. I think it was 11,719; I think it was.

Q. Average at Twenty-first street before any oil gas was added to it?

A. Not at Twenty-first street, but at Fourteenth street.

5030 Q. Well, at Fourteenth street—I should have said at Fourteenth street in my previous question. "Cost of labor per ton 4.48 cents;" what labor is that?

A. That's all, charging and drawing and handling coke.

Q. What rate of wages did you contemplate in that figure?

A. $1.75 and $2.50; $2.50 for the gas makers, high-priced men; $1.75 for yard men and such as were engaged in less skillful occupations.

Q. "Superintendent and foreman, .5;" what did you assume the salary of the superintendent and foremen to be on that computation?

A. Well, that would provide for a number of foremen and a general superintendent, and amounts on the whole output to about $50,000 a year. I put that as adequate to keep the works supplied with foremen and superintendent.

Q. Before you allowed for repairs to apparatus and buildings, 4.5 cents. You have now reduced that to 3.5 cents. Have you any exhibit before you now that you did not have before you when you answered and stated it [illegible] 4½ cents?

A. I have the same exhibits, but I have not examined them quite as minutely, and in looking over the cost of repair to apparatus and buildings through the various exhibits, it seemed to me I had got my figure excessive.

Q. You figured out, therefore, a cost before deduction of residuals of 38.951 cents, did you not?

A. Yes, sir.

Q. Now when you say in deducting residuals "For 66 per cent. coke and breeze," what do you mean exactly by that? 66 per cent. of what?

A. 66 per cent. of the weight of the coal is the usual average of coke and breeze on the various gas coals used in Pennsylvania.

Q. Less 20 per cent. for filling retorts?

A. That should be "firing" retorts.

5031 Q. Do you mean to say twenty per cent. of the 66 per cent., or twenty per cent. of the original one hundred per cent.?

A. Twenty per cent. of the 66.

Q. That is one-fifth of 66 per cent. off?

A. Yes.

Q. "Salable $4.00 per ton, two thousand." You use the short ton in that case, do you not?

A. Yes, I use that in regard to the value of coke, because most of the figures I have had in regard to the matter of coke are based on the short ton, or rather on the bushel, and converted into short tons. I always endeavor to sell coke by the measure rather than by the weight.

Q. That is $4.00 per ton for all the coke produced except that used in firing retorts?

A. Yes.

Q. Isn't it true that ten per cent. of coke is breeze, or something like that?

A. No, that would be a large percentage of breeze, rather large, I think.

Q. Then if you get ten per cent. breeze out of the coke, that would not sell for more than one dollar a ton, would it?

A. Well, I think they will use and get the full carbon value in using the breeze around the works. Even with the breakage of the coke it is not all inferior fuel, if it is properly handled, and you can use that percentage at the works and get the full value.

Q. Have you assumed, therefore, that the twenty per cent. taken out of the production of coke for firing retorts will include all the breeze?

A. No, sir, not all the breeze; just its ordinary percentage. The firing in this case is done in the generator producing the gas first, and there is no loss practically there. That can all be drawn right from the retorts into the producers.

Q. I am reaching this point; part of this coke is breeze and will not bring $4.00 a ton if it is sold; that is conceded, I suppose.

A. Yes.

5032 Q. Now, I am asking you whether you assume that no part of the coke sold is breeze?

A. No, I don't think you could get full value with the breeze. The idea of this estimate is that the breeze could be used in the producers or in the boiler fires.

Q. Then your idea is that it would be used by the company and would not be sold, and in that case you would have to deduct something from the amount of your coke sold, wouldn't you?

A. No, whatever is used by the company—I consider that a sale, that is, it is charged at the same rate as coke charged and handled, just the same as coke sold to the operation of the works—you have to have it enter into your accounts in some fashion, and therefore it would be charged to operation at the same—well, that is the total value for that purpose anyhow.

Q. Then all the coke made would be charged into the cost of gas at four dollars, wouldn't it, on that theory?

A. Well, it is practically, because if you did not have that twenty per cent. deducted from the coke in order to arrive at the salable coke you would have that much more. It is practically charging it to the——

Q. Let me see if I understand you. After you have deducted the twenty per cent. of the 66 per cent. of coke and breeze for firing retorts you still have left a certain amount of coke and breeze; that is right so far, isn't it?

A. Yes.

Q. And you have put down "salable at four dollars a ton, two thousand pounds." I understand you to say that that is not to be sold, but is to be used by the company or that some part of it is to be used by the company?

A. Yes, the breeze part could be used. I think that is perfectly available for the generators.

5033 Q. You think it should be charged to the company if it is so used in its manufacturing cost at four dollars per ton for the breeze?

A. Just the same as fuel value, as such.

Q. But you have not included this amount in your cost of gas at all, have you?

A. It is the same thing, deducting from residuals. If I had not deducted that twenty per cent. you would have had just that much more coke and I would have turned right around and——

Q. I am not talking about the twenty per cent.; I am talking about the proportion of what is left after the twenty per cent. is taken out, which is breeze?

A. No.

Q. You have not included that in your cost of gas at all as you would have to if it were used by the company, have you?

A. That I think was included in the boiler fuel, yes. There was some charge there for boiler fuel.

Q. Show me the item which includes that, Mr. Edgerton. Do you mean to say that it was used for boiler fuel in making the oil gas?

A. The boiler coal is six pounds to the thousand.

Q. Boiler coal?

A. Boiler fuel or coal.

Q. Do I understand now that you want to change your statement in here under the "cost of a thousand feet, oil and water gas, 50 candle power," from "boiler coal" to boiler fuel?

A. Well, I have considered both coke and coal fuel. I think they are interchangeable.

Q. Oh, well, that may be. I am taking your own terms. I find under the heading, "cost of a thousand feet, oil and water gas, 50 candle power," the expression "boiler coal." Now I want to know whether that is coal or whether it is something else?

A. Well, we use coal or coke and screenings for boiler fuel right along every day.

5034 Q. But I find in this statement you have very carefully specified coal in one place, coke in another place and breeze in another place. You have distinguished them. Now I want to know whether this item, under the "cost of a thousand feet, oil and water gas, 50 candle power," of "boiler coal" is correct or whether you want to change it so as to read differently?

A. You might make it fuel instead of coal.

Q. I am not going to do anything. I want to know whether you want to make any change in that regard?

A. I don't see any use for it.

Q. Then the coke is not included under the item "boiler coal," is it?

A. I wouldn't say it was exclu-ed.

Q. Well, is it included?

A. Well, as far as that is concerned we use it I say with whatever comes to hand. If we have screenings and breeze and coal it is put into the use of the boilers or into the use of the cupolas or generators indiscriminately.

Q. I will ask you again this question: under the term "boiler coal" do you mean coal, or do you mean in whole or in part breeze, screenings?

A. I meant fuel of any kind that was useful for a boiler.

Q. But in relation to the previous statement where you say you have some breeze left that is not worth for sale in the market four dollars a ton, you suggested it might be used for boiler fuel. Now, I ask you whether this item "boiler coal" contemplates the use of that breeze as boiler fuel?

A. Yes, certainly we intended to use the breeze as boiler fuel.

Q. Then "boiler coal" does not mean boiler coal but boiler fuel, is that right?

A. Fuel and coal are used indiscriminately.

Q. Well, what does it mean here?

A. It means boiler fuel, that is what it means.

5035 Q. Very good. Now, under this same heading, "cost of a thousand feet, oil and water gas, 50-candle power" we have generator coal at $4.30 a long ton, using twenty pounds per thousand. Have you figured out to see whether twenty pounds per thousand does not mean 100 per cent. efficiency for that fuel, assuming it to be solid carbon and without any waste whatever even for ash?

A. No.

Q. Have you figured that out?

A. No, I know what can be done with it.

Q. Well, have you made any computation to find out whether solid carbon with no ash used at an efficiency of 100 per cent. would be any thing better than twenty pounds per thousand?

A. Why, running only half the time I made it for twenty-eight pounds in little Danbury, and I thought twenty pounds was a liberal allowance here.

Q. Now, I want you to show any place where you have used twenty pounds only per thousand for generator coal, the results that you have got right here; let us have the place.

A. I say I have used the average of the month, running over half the time or twelve hours a day, twenty pounds a thousand, for making rich gas.

Q. Making rich gas such as you use?

A. Yes, making rich gas. It does not take anything like the amount of coke per thousand to make rich gas that it does to make poor gas.

Q. Isn't it fundamental that the more you make blue gas the more fuel you have to put into it?

A. Yes, that is just the trouble. This is not blue gas; it is 50-candle power gas. There is nothing blue about that.

Q. Do you mean to say this rich gas you use requires less fuel?

A. I mean exactly that. A great deal less, that is what is the matter.

Q. Have you within the last year or so handed to a Mr. Miller certain figures and estimates relating to the experience at Danbury, and if so will you be good enough to look at those sheets and
5036 see if they are in substance the sheets that you handed to Mr. Miller?

A. Yes. There is coal per thousand (indicating).

Q. Just answer the question?

A. Yes, certainly.

Mr. Mathewson: I ask to have these sheets marked for identification.

Marked for identification Complainant's Exhibit 270.

Q. Now will you look at the last sheet, which is headed "figures furnished by H. H. Edgerton," and say whether the coal per thousand in the carbonized report of the Danbury Gass Works which you say uses this system does not run from 28.08 to 45.72 for the year ending May 1, 1905, according to that statement?

A. Yes, sir, running half the time or less.

Q. Well, that is the fact, isn't it?

A. Yes; 28 pounds.

Q. One month, November, 1904, this would appear to be, you get 28.08?

—. Yes, sir. How many hours was that?

Q. And the average is 34.25, isn't it, per thousand feet?

A. Yes, sir, for the year, running 3,400 hours total for that year?

Q. Well, I am talking about per thousand feet?

A. Well——

Q. And it appears that the candle power at Danbury, average for a year, instead of being 44, as I understood you to testify, is 35.76 candle, isn't it?

A. Yes, that was with a two-foot burner, not tested by Mr. Love.

Q. Well, these are figures you gave to Mr. Miller?

The **Master**: Yes, he said so.

5037 Q. And you were conferring with him with a view to showing him how favorable a process this was and getting him to install it at another place, were you not?

A. No, sir; no, no.

Q. Were you?

A. No, sir; there wasn't a word said about installing at any other place, or any other process.

Q. What was the object of giving these to Mr. Miller then?

A. I directed those to Mr. Bradley. I don't remember Mr. Miller in the case.

Q. Mr. Bradley, the chief engineer of the Consolidated Gas Company?

A. Yes, I don't remember addressing anything to Mr. Miller.

Q. Weren't those figures delivered in reference to a proposed plant at Hyattsville, near Washington, with a view to the possible installation of a plant there of the character of the plant at Danbury?

A. Well, those figures——

Q. Well, wasn't that the fact?

A. I gave those figures to several people, but I suppose these are the figures that came through Mr. Bradley. I don't know how you got hold of any Hyattsville.

Q. Weren't these delivered to them in connection with a proposed plant at Hyattsville, and weren't they delivered to Mr. A. S. Miller, general manager of the Consolidated Gas, Electric Light and Power Company of Baltimore?

A. No.

Q. And who was also president of the Hyattsville Company?

A. There is no Hyattsville Company that ever I heard of. That is, the papers were given to Mr. T. J. Hayward, of Bartlett, Hayward & Co., and he turned them over to Mr. Miller, and said go down and see Mr. Miller and explain them to him, and I went down there and explained the figures to Mr. Miller.

Q. And they were given in connection with the proposed plant at Hyattsville?

A. Yes. Not proposed to Mr. Miller, however.

5038 Q. Now, your charge at Danbury to consumers is figured out on a basis of 44-candle power in making your adjustment, isn't it?

A. Yes; 17.6, yes, 44-candle.

Q. And is this a true statement with these figures upon it, a true statement of the candle power of Danbury for the year ending May 1, 1905?

A. Yes, sir, the tests are very carefully made, but they are made with a two-foot burner, as I tell you, instead of a 5-foot.

Q. Isn't the two-foot burner the most favorable burner to test with as far as candle power is concerned, for the gas?

A. Oh, no, I can bring you forty-five candles out of the same gas by simply putting on a large burner and putting it under the same pressure or a little more than the inspector does in New York City; I can get forty-five candles out of it readily.

Q. More pressure?

A. No, by less pressure.

Q. Does it not produce a smoky gas under less pressure?

A. No, not any smokier than the Consolidated gas, so far as I can determine.

Q. I do not ask you to make comparisons, does it or doesn't it produce a smoky gas?

A. No, a very brilliant, clear flame; a very fine flame, that I don't think would give off any smoke in ordinary use.

Q. Then you figure out for your coal gas, fourteen candle power, residuals amounting to 31.83 cents?

A. Yes, sir.

Q. Which you deduct from 38.951 cents to leave an actual cost of coal gas in the holder of only 7.121 cents; that is correct, isn't it?

A. That is right.

Q. On the other hand, the cost of the oil and water gas upon this assumed basis you compute at 48.45, is that right?

A. Yes, I think that is correct.

Mr. KIRBY: Per thousand cubic feet?

Mr. MATHEWSON: Per thousand cubic feet always.

5039 Q. And you get the total cost of a thousand cubic feet of 22.1 candle power at only 16.419 cents in the holder, is that right?

A. Yes, that is right.

Q. And you really think that it is feasible and practicable to manufacture gas in the City of New York, such as we have to deliver here in the holder at that figure, is that right?

A. In those proportions, yes.

Q. Well, these proportions are the ones you assumed in the computation?

A. Yes.

Q. They are not mine. And this you understand allows only one-tenth of a candle above the figures required by law?

A. No, there are about two candles above. They allow there for the mixture as proposed, but I take out by the use of lime two per cent. of carbonic acid which usually accompanies the gas, and that would account for about two candles difference. In other words, by taking out the carbonic acid to the amount of two per cent the candle power would be increased. Those figures are based on the candle power with the carbonic acid remaining in the lime, .75 of a cent is intended to take it out.

Q. Do you mean to say that the cost that you have allowed for purification is sufficient if you were going to take out the carbonic acid?

A. Yes, I think so. The material.

Q. And is this 22.1 candle power at the works of the Company or at the station of the City, a mile from the works?

A. That is at the works.

Q. What amount of lime do you allow in this purification including the extraction of the carbonic acid?

A. I think it was about 25,000 feet to the bushel of slaked lime, something like that.

Q. And how much a bushel?

A. I have forgotten. I haven't the price of lime, the strength of it,
how much it would lose and how much it would swell in slak-
5040 ing. I think it is shown down here as 56 cents. That is not
the slaked lime, though. That is unslaked lime.

Q. What wages did you allow for labor in the oil gas computation of 1.78 of a cent?

A. Well, I had that a little higher, but after consulting the records of the Consolidated Company and taking into consideration the large amount of gas that would be made I cut down to within a half a cent of there cost; it is a half a cent more than the cost of the Consolidated at present.

Q. For labor in producing what kind of oil gas?

A. Labor in producing oil and water gas. This is really a cheaper gas, as far as labor is concerned, as far as I can see, than the other forms of gas.

Q. Did you figure on this oil gas, in supplying New York, to be manufactured at one works or in various works at different points?

A. It ought to be made at one works really if you want to do it right.

Q. Is that what you figured on in this estimate?

A. Yes, it could be done at the same works in such a large scale, but the mixing would present some difficulties. However, if they would mix them thoroughly before they entered the holder it would be all right. If they let it get to the holder and attempted to mix it in the consumers' pipes, or the mains, it would have inequalities.

Q. Well, now, I see that in your statement dealing with the mixture consisting of 16-candle power coal gas and 28-candle power water gas you figured on the cost of the coal gas to be 7.51 cents and of the oil gas to be 34.645 cents, and the cost of the mixture in the holder to be 21.098 cents per thousand. That is about five cents higher than the result from mixing 14-candle power coal gas with
50-candle power gas?

5041 A. Yes, I think that would be a less economical mixture
than the other on account of the——

Q. Then the more water and oil gas you used and the less coal gas, the higher the cost of the mixture, is it?

A. Yes, undoubtedly; it takes less oil to illuminate coal gas than it does to illuminate water gas.

Q. Now, I see on your second statement under "Cost of one thousand cubic feet coal gas, 16-candle power," you stated that the average yield is 10,640 cubic feet per ton of coal.

A. Yes.

Q. The coal costing $3.20 per ton, but in your former statement you say that the coal costing $3.20 per ton you assume will produce 11,648 feet, or more than one thousand feet per ton more; how does that happen?

A. Well, in that case, as always happens in coal gas, the higher we drive the yield the more we exhaust the yield. The lower the candle power of the gas. In one case I am making 14-candle power gas at which I got 11,648, and the other making 16-candle power gas and cutting off the yield we get the higher candle power of 16.

Q. You mean to say that without adding to the volume of the gas by oil gas or water gas you can simply drive out of the coal 11,648 of 14-candle power gas or 10,640 cubic feet of the 16-candle power coal gas, taking the same coal, do you?

A. Yes, that would be about the way it would run. I have made many experiments in regard to that; it is a good many years ago, but they hold, I think, just as good now.

Q. When you are speaking of candle power, what burner did you use in computing the candle power that you have used in these statements?

A. The London Argan D.

Q. You do not use a flat-frame burner such as is used in New York by the City testing inspector?

5042 A. No. At about 18 to 19 the two burners give the same result.

Q. Did you get your 22.1 on the Argand or the flat-frame, or do you contemplate getting it on the Argand or flat-frame?

A. On the flat-frame. The Argand would not give 22 with that gas.

Q. Now will you look at Complainant's Exhibit 258 for identification, which was the page of your memorandum book, and say whether your 36.12 which you testified to the other day should not be 39.12? In other words, didn't you make a mistake of three cents in the addition of the figures that you took?

A. No, that was scratched out. It was part of it—the addition comes to 36.12. This figure was scratched out because the labor of gas purifying was—it was opposite that line, but it does not foot up—you will see it foots up 36.12, leaving that out.

Q. Leaving out the three cents which appears in there?

A. Yes. It is a duplication.

Q. And isn't it true that in connection with the repairs to apparatus and buildings you stated in your previous testimony 4½ cents as the amount, applying it to 225 cubic feet of gas?

A. No, that was applied or intended to be applied to the whole mixture.

Q. But it was not in the figures on that page, was it?

A. Yes; repairs to apparatus and buildings is intended to cover both coal gas and the oil gas, and so shows here.

Q. Well, if you have labor in gas making and purifying, three cents, meaning a thousand feet, as you stated in first computation and crossed it out, then for 225 feet it would be something like one-quarter of three cents, wouldn't it, or .75 of a cent instead of .3 of a cent?

A. Yes, that rose in this way: I took the cost of making 5043 a thousand feet and taking the cost of labor at three cents, from my judgment, and looking over the data of the Consolidated Company I found owing to the large product they made so much less, I thought I had that too high really and cut it down.

Q. Now, the repairs in works where machinery is used for handling coal would naturally be larger than in works not equipped with so much machinery and where hand labor was used, would they not?

A. Yes. I think I allowed for that.

Mr. Mathewson: That is all. I would like to have that page which is marked Complainant's Exhibit 258 for identification printed, if these exhibits for identification are to be printed.

Mr. Page: Are you having the Danbury record printed?

Mr. Mathewson: Yes.

Mr. Page: What I had marked for identification and had printed were some papers which were offered in evidence. Now here are some memoranda Mr. Mathewson produces from his pocket and asked the witness some few questions about, they are marked for identification and he wants them printed. I really should insist on his putting them in evidence, he having cross-examined the witness on them. I do not see they are proper in the case at all.

The Master: Isn't that so, Mr. Mathewson?

Mr. Mathewson: I rather think it is so. I probably shall offer them later in the day. I will withhold offering them until I reach my case, which would be more in order. I offer in evidence, however, the page of witness's book, Complainant's Exhibit 258 for identification, so that it may go in at this point.

5044 The Master: Was that particular page Exhibit 258, or was the whole book Exhibit 258?

Mr. Mathewson: Just that one page.

Received in evidence and marked Complainant's Exhibit 258, December 26th, 1906.

Redirect examination by Mr. Kirby:

Q. Referring to Complainant's Exhibit 258, we find the statement "labor, gas making and purifying, three cents." Do I understand there was a memorandum of yours and that through the three-cent item you have drawn that line for the purpose of erasing it?

A. Yes.

Q. And that that cost is included in other items and not added in that total of 36.12 cents appearing immediately thereunder?

A. Yes, sir.

Q. Opposite the item "Tar, 12 gallons at 5 cents" I find .600, then on the same line 5.65, then on the same line .56?

A. Well, that is all an error there. That 56 is on the basis—is incorrect—some figuring I did here on the jump.

Q. And which is not the correct conclusion?

A. No.

Q. What is the correct conclusion there?

A. I think it is 5.65, as originally put down.

Q. Is that also true of the item "Ammonia Liquor?"

A. Yes, sir.

Q. Where the figures 4.71 have been changed to .47?

A. Yes.

Q. So that your original statement of 23.26 cents was only in error and that you used the short ton of 2,000 pounds instead of the long ton of 2240 pounds and did not have a mixture of only 1,000 cubic feet of gas?

A. That is true. I had not allowed for the bulk of the enriching gas nor have I allowed for the long ton; I have a short ton, and with those two exceptions that is very nearly accurate. There
5045 may be some trivial decimal errors there in arithmetic, but it is substantially correct.

Q. Now in your statement of the cost of 1,000 cubic feet of 14 candle-power coal gas you state the yield of gas from a ton of coal to be 11,648, and in your statement of the cost of 1,000 cubic feet of 15 candle-power gas you state your yield to be 10,640 cubic feet from a long ton of coal. This yield is based upon the result of your investigation as to the yield from coal, is it not?

A. Yes

Q. And when you state you have referred to the figures of the Consolidated Company you did so only as a matter of reference and for confirmation, did you not?

A. That's all. They seem to agree very well with my own experience in regard to the yield, correctly given.

Q. And you consider that from a ton of coal it is possible to obtain coke which is salable, that is, contain none but a very small proportion of breeze, which will consist of that which is left after deducting 66 per cent. of the ton and deducting 20 per cent. therefrom for firing of retorts?

A. Yes. That is possible. In fact, it has been done in practice.

Recross-examination by Mr. Mathewson:

Q. Do you mean to tell me that you confirmed from the Consolidated records the proposition that from 20 pounds of generator coal you get one thousand feet of gas?

A. No.

Q. You did not find any such result there, did you?

A. No.

Q. Well, I want you now, you are so particular about this, to give me a company that is doing that now, getting one thousand feet of gas from 20 pounds of coal; just give me the name of the company doing it; I mean of this water oil gas?

A. Well, of the water gas, I consider when I am operating
5046 at 28 pounds and running only half the time and keeping the fire up in the meantime, and with a loss of radiation, that twenty pounds would be an ample allowance, running all the time.

Q. But we have seen that the average at Danbury, according to this statement you presented, showed nearer thirty-five than twenty-eight pounds for the year.

A. Yes, but it is running only a small portion of the time; that is, it is running less than half the time.

Q. Well, the average so far as it was running—you have referred to the fact it was only running half the time—was not twenty-eight and a fraction, but was nearer to thirty-five, according to this statement, wasn't it?

A. Yes, but the management——

Q. Well, that is the point. Now, will you show me any company producing this amount of gas with the use of only twenty pounds per thousand feet of gas produced, not reasoning from what some company is doing, or as to what they might do under other circumstances, but give me the name of one company producing this kind of gas and using only twenty pounds of fuel per thousand feet under the boilers?

A. Not under the boilers.

Q. No, I mean generator coal. Strike out under the boilers.

A. Well, you give me works running twenty-four hours, and I will do it.

Q. I ask you to name to me the works that are doing this.

A. I didn't know of any works running twenty-four hours doing it, or twenty hours would do it. Have you got those figures there as to the twenty-eight pounds? No, this twenty-eight pounds in November was only running on 360 running hours during the month.

Q. Yes, I understand that you reason something from that.

A. Yes, and you can reason a good deal from it, too.

5047 Q. Too much, we think. Did they balance up the coal pile at the beginning and end of the period to which you refer, November, 1904?

A. Yes, and the gas has to stand the shortage.

Q. What?

A. The gas account has to stand all the shortage besides because of the electric——

Q. That may be, but I am asking you if for that particular month they balanced up the coal pile at the beginning and end of the month so that they know how much they use exactly to a pound or a few pounds?

A. Pretty near it.

Q. I find in this statement, Complainant's Exhibit 270 for identification, that the amount of coal used for the year has been stated, but not for the separate months, the balanced coal.

A. It is oil I guess you are talking about, isn't it? I don't see any balance about coal. I see the oil is stated; the inventories are taken at the end of the fiscal year of the coal and whatever shortage comes in there comes on the gas.

Q. I understand that is so for the year, but you do not balance your coal pile each month, do you?

A. No, we could not do that.

Q. Well, you don't do that, do you?

A. Stock on hand is not taken each month, but it is weighed carefully into the generators and they use more than ordinary care in making that out. I watched it frequently and have had weights put on the scales and tested them; in fact, I don't know a place——

Q. At Danbury?

A. Yes. I don't know a place where as much care is taken as you will see there in regard to oil. Shortage on oil is stated to be due to the clogging up of the oil gauge pipes. It was quite a while before I found out what was the matter; and there is a great deal of care exercised in their quantities and weights.

5048 By Mr. **Kirby**:

Q. You desire to give an explanation of how a decreased quantity of coal can be used in making this very rich oil and water gas. You may so do.

A. The chief function of the fuel in making a rich oil gas is simply to decompose the oil vapors into gases. There is very little coal used except for fuel. But the function of coal as a fuel in making water gas is not only to furnish the heat for the decomposing of the water, but also all the carbons for the carbonic oxide and carbonic acid entering into the gas; and it is found by the most ordinary observation and tests that while one takes a very moderate — of heat to decompose the oil gas, that a very large quantity is taken to make the water gas part for that reason. It not only serves the decomposing, but also has to form the body of the gas. In the case of oil, the oil forms the body of the gas and not the coal.

By Mr. **Mathewson**:

Q. Didn't you say somewhere in your testimony that this twenty pounds per thousand feet was for blue gas?

A. No, if I did I misunderstood you; I didn't mean to. Blue gas takes a great deal more than twenty pounds per thousand, there is thirty per cent. of blue gas in it, or about that.

Q. How many pounds of coal would be required for all blue gas with no oil in it at all, Mr. Edgerton?

A. Well, there are various—it is according to how it is made; there are various processes. Some come as high as thirty thousand feet.

Q. I am getting not claims, I am getting your views on the subject; give us your own views.

A. Well, I don't remember of making any blue water gas alone in any of the works, except occasionally just for getting samples
5049 to test. It is made always in a mixture with the coal gas, or oil gas, and the only way we arrive at it is by analysis of the gas as to what percentage of blue gas there is in it. I used to make them entirely separate and record in a separate meter; but they were still made in the same vessel; but there are processes depending on blue gas alone; I think about thirty thousand feet to the ton is the highest that has ever been got out, and I rather doubted whether that was possible.

Q. To the long or short ton?

A. The long ton I believe that was. They made it down in——

Q. You never had any experience yourself, you say, in getting out blue gas?

A. I investigated works where they were doing it, but I never ran them. I went down to Bridgeport and got samples of gas; they were making it there and I had samples from various points, I don't remember just where. I made analyses of them and had statements of the cost of making it.

Mr. Page: The point having been raised as to these State's Exhibits NNN and OOO which were copied from the carbonizing book of the Twenty-first Street station, from that portion which Mr. Mathewson states is not in evidence, I asked him whether he would produce those books so we could offer those particular parts. I understand he is willing to accept these copies as being correct copies, but insists upon some objection that if the books were here they would be immaterial and irrelevant. Is that it?

Mr. Mathewson: Yes, I have objected to Exhibits NNN and OOO on the ground they are outside of the period under consideration and are not taken from any exhibit in evidence, and that that period was never offered in evidence, and I insist upon that objection. I do not
make the objection that these are not accurate transcripts
5050 from the books, assuming, of course, that we have an oppor-
tunity to verify it and call it to the Master's attention if we find it to be incorrect. I think that covers it.

The Master: What is the matter with that?

Mr. Page: The only thing then is I think they should be marked in evidence the same as if we produced the book here. We would have a right to subpœna the book and offer this testimony.

The Master: I understand the proposition is that these sheets should be treated here as if they were the original books, and as I understood, I excluded that.

Mr. Mathewson: Yes.

The Master: What do you gain by marking the original book?

Mr. Page: I understood you excluded it because it was not part of the exhibit.

The Master: No, but because it included part of the year 1902 and 1904, and the part that Mr. Mathewson introduced of that book was simply the year 1905.

Mr. Page: But that makes it competent if we want to offer another portion of that same book, does it not?

The Master: That may be, except that throughout this case we have kept clear of going into periods anterior to the year 1905, for the purpose of not broadening the issues to be tried.

Mr. Page: I know that has been the contention of the Consolidated Gas Company, that we could not look at anything except for the one year, but I do not so understand the issue, but that it was what it cost them to make and sell gas, and if they put in evidence their carbonizing record for the year 1905 and claim that they have to use a higher grade of oil and we can show by the same book that
in 1902 and 1904 they used this oil and produced candle
5051 power results from a different oil, I think that bears on the
statement that they have put in already. It is a basis of comparison.

The MASTER: Well, it may be, but I do not see what you gain by having the original book here under this situation.

Mr. PAGE: I do not if they are willing to waive the production of the book.

The MASTER: He does not make any point about their being copies.

Mr. PAGE: Yes, he says they should not have been copied at all.

The MASTER: I do not see what difference it makes. It is excluded anyway. If you had the original book here I would exclude it just the same. If you gentlemen have taken as long as you have to analyze the accounts for 1905, if you were to go back through all these books it would take until 1950 to analyze them.

Mr. PAGE: That is true, if we attempted to go through all the books, but we have simply taken a half a dozen items from these pages. I wish an exception to the ruling. We have nothing to offer to-morrow so far as the State is concerned, but we would like to get credit for that day so if we need another day in putting in the value of the plant it can be added on to our time.

The MASTER: What about Mr. Burr?

Mr. BURR: I regret to say that our worthy friend, Professor Bemis, is dangerously ill at his home in Cleveland and I have been in receipt of dispatches and letters from his people saying that he is more than anxious to come on, but his physician will not consider his coming on at his time. Dr. Marks I have not been able to see, because he is actively engaged in examining the plants. I do not suppose that I will take more than a couple of hours in gathering up the loose ends which the court referred to, and if it is entirely agree- 5052 able I suggest that the time which we might occupy to-morrow in gathering up these loose threads might be more properly credited to us if you will, from the 3rd of January; it will only make a difference of half a day. I want to say about Professor Bemis, all I wanted, for instance, was to put in, in better shape, in view of your ruling upon those letters which I produced here, the testimony as to the reduction of the cost of gas in Lynn, and the testimony of the growth of ppoulation of the City of New York; and really I do not believe that I would need more than an hour if you would say that we might have, in lieu of to-morrow, an hour in addition to the time set after the 3rd of January. I would be content as far as I am concerned and I join in the request of Senator Page in view of our practically having arrived at the termination of all the evidence that is ready to be submitted now, we having another day at our disposal, you might give us the benefit of this new day at the time we are putting in the evidence as to the value of the plant.

The MASTER: Do I understand that none of the defendants are prepared to do anything more now, until the day set by the court for the taking of the testimony of the value of the plants?

Mr. BURR: So I understand.

The MASTER: Is that true as to both sides?

Mr. PAGE: Yes.

Mr. MATHEWSON: I understand the Senator has stated that he has concluded except as to the value of the plant.

Mr. PAGE: Yes.

The Master states that owing to his engagements on the 2nd, 3rd and 4th of January the hearing will have to proceed on the 5th.

Adjourned to January 5, 1907, at 10.30 A. M.

Last Complainant's Exhibit 270.
Last State's Exhibit OOO.
Last City's Exhibit 124.

5053 Circuit Court of the United States, Southern District of New York.

CONSOLIDATED GAS COMPANY OF NEW YORK, Complainant,

vs.

JULIUS M. MAYER, as Attorney General of the State of New York; WILLIAM TRAVERS JEROME as District Attorney of New York County; FREDERICK E. GUNNISON, JOHN C. DAVIES, and LUCIAN L. SHEDDEN, Constituting the New York State Commission of Gas and Electricity, and the City of New York, Defendants.

Before Arthur H. Masten, Special Master.

JANUARY 5TH, 1907.

Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Kirby, Mr. Page.

5054 The MASTER: Are you ready to proceed, gentlemen?

Mr. PAGE: I see Mr. Burr wants me to put upon the record that I am not ready to proceed this morning. We finished the examination of the plants and are having the results of that examination tabulated so that we can put the testimony in in tabulated form in a very short time. That tabulation is not entirely completed. It will be on Monday morning.

The MASTER: How about you, Mr. Burr?

Mr. BURR: Mr. Master, I had understood and, in fact, it was arranged, that counsel of the State would proceed with the examination regarding the valuation of the plants to-day. That was distinctly understood, and I only heard to the contrary last evening, so that although Dr. Marks has been working continuously upon the subject matter since the last hearing, he is not entirely finished. However, if the State is not prepared to go on as they had intended, I will go ahead as far as I possibly can with Dr. Marks.

The MASTER: Very good.

Mr. PAGE: As I understand, Mr. Burr was communicated with about 12 o'clock yesterday and told that we could not go on.

Mr. BURR: I am not going to enter into any question of veracity about the time. I did not know anything about it until yesterday afternoon when Mr. Kirby telephoned me.

Mr. PAGE: I do not desire any controversy about it, I am sure.

Mr. BURR: I should have had a little more notice about it.

William D. Marks, resumed, testified as follows:

5055 Mr. **Page**: I think we should have some understanding, as to the methods of proof here, whether we are to go on immediately after the conclusion of Dr. Marks' direct-examination, or whether there is a record kept of the time and the cross-examination is to follow and we are to have our time on the direct.

The **Master**: Mr. Mathewson is entitled to be heard on that. It can be done either way. He can cross-examine as soon as Dr. Marks gets through and I will keep track of the time, or he can have the direct-examination of both of these witnesses for the city and the State finished and then have them reappear for cross-examination, whichever is satisfactory.

Mr. **Burr**: If I may make a suggestion, I think the latter plan would be better, to get the whole testimony in in regard to the valuation of the plants and then you can start in to cross-examine.

Mr. **Mathewson**: I think perhaps that would be the better plan. I cannot, however, quite say what my view will be until I see in what shape the witness is presenting his testimony. I suppose these two witnesses, Dr. Marks and Mr. Edgerton, covered the same plants, but whether they pursued the same methods, I cannot say.

Mr. Burr: I do not know what plants Mr. Edgerton has covered, but I know Dr. Marks has covered all the plants.

Mr. **Mathewson**: And Mr. Edgerton I suppose has done the same.

Mr. **Page**: Yes.

Mr. **Mathewson**: If the Master can suspend the ruling upon this until Dr. Marks has proceeded somewhat I would be very glad.

The **Master**: Very well.

5056 Mr. **Mathewson**: I will say, Senator, that my present feeling is, in view of the fact that the same plants are to be covered, that I would prefer to have you complete your direct testimony and see how much time is consumed, and then we can examine the witnesses on the cross, when recalled.

By Mr. **Burr**:

Q. Doctor, since the last hearing at which you appeared have you been engaged in making an examination of the remaining plants of the Consolidated Gas Company?

A. With the exception of 14th Sreet, I have been continuously engaged.

Q. I said of the remain*ed*r. You have been already examined in regard to the 14th Street plant?

A. I have.

Q. Did you make a personal examination of all the plants?

A. I made a personal examination of every plant in detail.

Q. All the apparatus?

A. All the apparatus.

Q. And the buildings?

A. And the buildings.

Q. And the holders?

A. Holders.

Q. And the tanks?

A. And the tanks and all.

Q. How long were you engaged in making the examination of these plants other than the 14th Street plant?

A. Actual physical examination?

Q. Yes.

A. Of the plants?

Q. Yes.

A. I can give you the date of each examination if you like.

Q. How long were you engaged in the examination of the plants, the number of days and number of nights?

(Witness refers to papers.)

Q. Well, about how many days?

A. From December 17th until the end of the month.

5057 Q. Until the end of December?

A. Until the end of December.

Q. Since that time have you been engaged in computing and making up the results of your examination during the time which you stated?

A. All of that time, from the beginning until coming to this meeting, I have been continuously engaged when not in the building, in either making or supervising computations.

Q. And you have prepared a statement showing each building and each item of apparatus and the value given by you to each building and to each item of apparatus and to everything else that is embraced in the work as far as machinery or other things that are used in the manufacture of gas at the various stations are concerned?

A. I have. I have prepared such an inventory.

Q. And you have given a value to each of these items appearing in those inventories so prepared by you?

A. I have.

Q. Taking out—I believe you testified at the last hearing that the value of the 14th Street station in your judgment was $1,469,064?

A. I did. That included depreciation.

Q. That is less depreciation?

A. Depreciation off.

Q. Will you give me the value of each station, the grand total as you found it of each station less depreciation?

Mr. Mathewson: I make the same objection to the witness' testimony that I think I have made heretofore, that he is not qualified as competent to testify as an expert as to these values.

The Master: Objection overruled.

Mr. Mathewson: Exception.

Q. What did you find the actual present value of the 21st Street station?

A. $2,094,746.

5058 Q. And the 42d Street station?

A. $821,468.

Q. Now, as to the Inwood station?

A. $10,596.

Q. The 99th Str-et station?
A. $568,751.
Q. 44th Street station?
A. $1,230,336.
Q. 111th Street station?
A. $838,147.
Q. 132d Street station?
A. $493,164.
Q. 18th Street station?
A. $223,627.
Q. 63d Street station?
A. $392,796.
Q. 65th Street station?
A. $1,205,997.
Q. Making a grand total of how much?
A. A grand total of $9,348,692.
Q. Including the 14th Street station?
A. Including the 14th Street station.
Q. That in your opinion is the value of all these plants and apparatus, less depreciation?
A. The actual present value of the buildings and gas-making apparatus in the plants to-day.

By Mr. MATHEWSON:

Q. You include the gas distributing apparatus, the holders?
A. Yes, making and distributing—the holding apparatus, I should say, not distributing.

By Mr. BURR:

Q. Taking the matter up in a little more detail, Doctor, referring to the 21st Street station; what did you find to be the total actual cost of buildings and structures to be?
A. The cost of buildings and structures, excavations of walls, etc., $743,700.
Q. Give me that in detail. You have lumped the two items. I want to get the specific item. What did you find the total actual cost of buildings and structures to be?
A. $723,500.
Q. And the excavation and walls?
A. Excavation and walls, etc., $20,200.
5059 Q. Making a total of?
A. $743,700.
Q. What did you find the total gas manufacturing machinery, apparatus and contents subjects to depreciation to be?
A. $594,000.
Q. And what did you find the value of the gas manufacturing machinery, apparatus and contents without depreciation to be?
A. Meaning by that apparently new machinery installed lately, $520,250.
Q. What was the valuation of the yard connection?
A. I adopted the figures given by Mr. Mayer, as it was impossible in the time allowed to go over them; $218,200.

Q. Gas holders and tanks, what did you value those at?

A. $630,900.

Q. The total of these amounts is how much subject to depreciation?

A. Subject to depreciation, $2,186,800.

Q. What do you figure the depreciation at?

A. Depreciation is figured at thirty-two years——

Q. Thirty-three years, is it not?

A. Thirty-three years, at .85 of 1 per cent. per year or about twenty-eight per cent., amounting to $612,304.

Q. Deducting that depreciation from the amount given, $2,186,800 leaves how much?

A. Leaves a balance of $1,574,496, which, added to the machinery relatively new, gives a total actual present value of the 21st Street station, machinery and buildings of $2,094,746.

Q. In other words, adding that $1,574,496 to the $520,250 which you have given as the valuation of the gas manufacturing machinery, apparatus and contents without depreciation gives you a total of $2,094,746?

A. That is it.

Q. As the actual present value of the 21st Street station, machinery and buildings?

A. It does.

5060 Q. Doctor, you have, of course, studied the valuation that has been placed upon all these various items that you are testifying to, as given by Mr. Mayer?

A. I have.

Q. Now, are there any of these buildings regarding which Mr. Mayer has testified which have already been appraised by Rowland?

A. Quite a number of them which were in existence in 1884.

Q. The same buildings that Rowland appraised in 1884 are still in existence and were appraised in 1906 by Mr. Mayer?

A. They were.

Q. I call your attention to this station, 21st Street, and ask you whether the sheds there, Nos, 2, 3, 4, 5, 6, 7, 8, 9 and 10 were in existence and appraised by Rowland in 1884?

A. They were.

Q. What is the valuation given by Rowland in 1884 for those sheds?

A. $246,349.

Q. With depreciation?

A. With depreciation.

Q. What is the value which Mr. Mayer has placed upon it?

A. $677,183, in 1906.

Q. So there is an excess in valuation by Mr. Mayer of $430,834 over the valuation placed by Rowland in 1884?

A. There is.

Q. What did you find the condition of the scrubber house to be—the shed?

A. In the case of the shaving scrubber house, -he roof had entirely vanished, the floor remained there in portions but it was rotted and in a wretched condition.

Q. In the retort house, what did you find?

A. In the retort house I found 32 benches of sixes, of which 36 were fired and 156 were idle, and also 20 benches of sixes, of which none were fired and 120 were idle.

Q. And in the 22d Street retort house?

A. Twenty benches of sixes, of which none were fired and 120 were idle.

Q. What did you find the percentage of retorts used to be?

A. The percentage of the total number of retorts in actual use was 11½ per cent., about.

Mr. Burr: If the Master thinks it will facilitate matters
5061 and will be a more orderly arrangement I can have him say
this is his statement with regard to the 21st Street station, and have that as his answer to that. He may incorporate it here, and the same way with regard to the other stations. I will give Mr. Mathewson copies of them.

The Master: Is there any objection to that Mr. Mathewson?

Mr. Mathewson: No, I think that would be the better plan.

Mr. Burr: That will be a saving of time and give you an opportunity to go over the figures, because I have a great mass of detail in addition to this in these statements which will be subject to your cross-examination, but this will give you the idea of valuation he has placed upon each item and how we have arrived at it and you can bring out on cross-examination what you desire. In other words, then, if it pleases the Master, I will say that he has prepared a statement showing the valuation placed by him upon all the items in the 21st Street station, and that this statement which I now hand the stenographer shows that, the first page being a summary.

Mr. Mathewson: I think the witness perhaps ought to testify he did prepare these items.

Mr. Burr: Yes, I will bring that out.

Q. You have also prepared a statement showing the valuations placed by you upon each item, including buildings and apparatus of the other stations, have you not?

A. Yes.

Mr. Burr: So I wil- hand the stenographer the itemized schedules showing valuations placed by Dr. Marks on each of the
5062 buildings, and each and all of the apparatus at the following
plants: 14th Street, 42d Street, 44th Street, 21st Street, 99th Street, 18th Street, 63d Street, 65th Street, 111th Street, 132d Street and Inwood.

5063 RECAPITULATION OF INVENTORY OF 14TH STREET STATION OF THE CONSOLIDATED GAS COMPANY, 1906.

(See testimony before Master, pages 4564 and 4584.)

Total actual first cost of buildings and structures (inventory 1884)................	$1,706,294	
Depreciation (50 years at .85 of 1%) 42½%.	725,175	
		$981,119
Gas Machinery and Appr. added since 1884 (actual cost)	132,000	
Depreciation (12 years at .85 of 1%) 10%..	13,200	
		118,800
Actual cost Yard and Holder connections in 1906 (Meyer)	146,895	
Actual cost Yard and Holder connections in 1884	82,178	
Actual cost additions to yard connections..	64,717	
Depreciation 10%	6,472	
		58,245
Actual cost of holder and steel tank (no depr.)	225,000	
Actual cost of foundations for holder (no depr.)	50,000	
		275,000
Actual cost of new buildings added (no depr.)........		35,900
Actual present value of buildings and apparatus.......		$1,469,064

5076 RECAPITULATION OF INVENTORY OF 21ST STREET BUILDINGS AND APPARATUS, CONSOLIDATED GAS COMPANY.

Total Actual 1st Cost of Bldgs. and Structures (Av. date 1874)	$723,500		
Total Actual 1st Cost of Excavation and Walls, etc.	20,200		
		$743,700	
Total Gas Manufacturing Mach. App. and Cont. Subj. Depreciation		594,000	
Total Gas Manufacturing Mach. App. and Cont. Without Depreciation			$520,250

Total Yard Connections (Meyer's Figs.)...	218,200	
Total Gas Holders and Tanks............	630,900	
Total Subject to Depreciation.............	$2,186,800	
Depreciation (33 Years at .85 of 1 per cent.) 28 per cent.........................	612,304	
		1,574,496
Actual Present Value of 21st St. Station, Mach. and Bldgs.		$2,094,746

NOTE—

Meyer's Valuation of Sheds 2, 3, 4, 5, 6, 7, 8, 9 and 10 in 1905.................	$677,183 with dep.
Rowland's valuation of Sheds 2, 3, 4, 5, 6, 7, 8, 9 and 10 in 1884..............	246,349 with dep.
Excess in Valuation by Meyer............	$430,834

Roof gone. Floor rotted to shaving Scrubber House (shed).

NOTE—December, 1906:

Retort House	Benches	Retorts	Fired	Idle
Old R. H. (88)......	32	192	36	156
R. H., 22d St. (130)..	20	120	00	120
		312	36	276

(Per cent. retorts used 11½ total.)

Water gas apparatus appears to be in operating condition throughout.

With the exception of $520,250 value of Machinery not depreciated most of the remainder appears old and dirty.

All of the Buildings are sound, but require small repairs.

5077 INVENTORIES OF BUILDINGS AND APPARATUS OF TWENTY-FIRST STREET GAS WORKS OF THE CONSOLIDATED GAS COMPANY OF NEW YORK CITY, 1906.

77	Miscellaneous tanks and boiler house	1,200.00	
78	Retort house, 22 benches,		
79	Total	188,200.00	79,800.00
80	2 holders, 600,000 c. f. (83)	150,000.00	
81	1 holder, 300,000 c. f. (84).......	52,500.00	
82	1 holder, 100,000 c. f. (85).......	30,000.00	
83	2 brick tanks,		
84	1 brick tank,		
85	1 brick tank,		
	Total	232,500.00	

5089 RECAPITULATION OF INVENTORY OF 18TH STREET BUILDINGS AND APPARATUS, CONSOLIDATED GAS COMPANY.

Total Actual 1st Cost of Buildings, and Structures, Bldgs...	$53,890.91	
Total Actual 1st Cost of Solid Walls	4,559.00	
Total Actual 1st Cost of Other Structures	7,480.00	
		$65,929.91
Total Actual 1st Cost of Gas . Making Appr.		15,000.00
Total Actual 1st Cost of Yard Connections (Mayer's)		21,987.00
Total Actual 1st Cost of Gas Holders and Tanks.........		286,000.00
Total Actual 1st Cost Subject to Depr.		388,917.00
Depreciation (50 years at .85 of 1%) 42½%		165,290.00
Actual Present Value of that part of 18th Street Station in use..		$223,627.00

NOTE.

Mayer's valuation, Brick and Brownstone Bldg. for holders (1905)	$155,784
Rowland's valuation, Brick and Brownstone Bldg. for holders (1884)	45,241
Excess valuation, Brick and Brownstone Bldg. for holders.	110,543

Apparatus not in use:

The principal items of abandoned apparatus appear to be (so far as visible)

5090	In Retort House..............	60 benches 6's or 360 retorts.
	In Purifying House..................	12 Purifying Boxes.
	In Yard	2 Tower Scrubbers.
	In Yard	Multitubular Condensers.
	In Meter House	2-14 ft. Meters.

Also a vast amount of scrapped machinery.

See Mayer's testimony as to part of plant, Test. before Master, Page 1381.

5091 INVENTORIES OF BUILDINGS AND APPARATUS OF THE 18TH STREET GAS WORKS OF THE CONSOLIDATED GAS COMPANY OF NEW YORK CITY, 1906.

[* Figures enclosed in brackets erased in copy.]
† Corrected Jan. 8, 1907.

5098 RECAPITULATION OF INVENTORY OF 111TH STREET STATION, CONSOLIDATED GAS COMPANY, NEW YORK CITY.

Total actual first cost of buildings and Structures,			
Buildings not depr.			$20,921.53
Buildings depreciated		$64,290.70	
Walls and fences depr.		4,010.00	
Total actual first cost gas mach., app. (depr.)		93,000.00	
Total actual first cost of gas mach., app. (not depr.)			20,900.00
Total actual first cost yard connections (Mayer)			27,068.00
Total actual first cost gas holders and tanks			704,737.00
Subject to depreciation		$161,300.70	
Depreciation (36 years, at .85 of 1%)	30%		
Depreciation, neglect and decay	30%		
	60%	96,780.00	
			64,520.70
Actual present value of 111th St. Station			$838,147.00

NOTE—

The old retort and generator houses and their contents are open to the weather through large openings in the roof.

The fences, walls and apparatus at the wharf are falling into decay.

The 21 benches of the retorts are old fashioned, and can never be used satisfactorily.

Capacity equivalent to 242 single retorts.

5099 INVENTORIES OF BUILDINGS AND APPARATUS OF THE 111TH STREET GAS WORKS OF THE CONSOLIDATED GAS COMPANY OF NEW YORK CITY, 1906.

	Buildings only.	Total cost.	Values not computed.
1	Office (17)	5,931.25	
2	Exhauster house	18,352.82	
3	Boiler house	2,568.71	
4	Hoisting engine house	81.90	
5	Scale house	351.00	
6	Stable	8,400.00	
7	Boiler, coal storage		600.00

8	Generator house	9,331.20	
9	Wooden tool shed	1,418.63	
10	Retort house (R. inc. Mains)	36,900.00	
11	Foundations for old oil tanks		1,000.00
12	Blacksmith shop (machine shop)	1,679.60	
13	Fences		270.00
13	Fences around holders		1,140.00
15	Fences around old works		1,000.00
16	Brick walls on 1st Ave	197.12	
		85,015.11	4,010.00
	Walls	197.12	
	Values not com. in c. f	4,010.00	
		89,222.23	
	Apparatus only.	Act. cost.	Dep. cost.
17	Office bldg., contents (1)		2,500.00
18	Exhauster house, 42 valve stands		700.00
19	2 No. 11 vertical Root exhausters		900.00
20	Paine Revers. Motion engine, 16 x 16		3,600.00
5100			
21	Two thirty-six Connely gas governors		4,500.00
22	1 Cockraine feed water heater		400.00
23	Steam exhaust gauge, piping, etc		1,600.00
24	1 photometer		800.00
25	Boiler house, 1 G. steel stack		500.00
26	Breech for stack		200.00
27	3 boilers, 66 in. x 66 ft		5,000.00
28	1 Knowles pump, 6 x 4 x 7		100.00
29	1 11½-in. Hancock inspirator		100.00
30	Hoisting engine house, contents	1,100.00	
31	Scale house, contents (Scale)	300.00	
32	Stable, 32 stalls	600.00	
33	Tool shed	300.00	
34	Retort house, 16 benches of 6's	64,000.00	
35	5 benches of 5's	17,500.00	
36	Blacksmith shop, contents	200.00	
37	Yard oil tank, 43 x 20	3,000.00	
38	Atmospheric condenser	6,000.00	
		93,000.00	20,900.00
39	24 in. x 36 in. connection,		
40	11½ in. to 4 in.		
41	Valves,		
42	2 holders, 5,000,000 cap.		
43	Foundations for holders		704,737.00

5101 RECAPITULATION OF INVENTORY OF 132ND STREET BUILDINGS AND APPARATUS, CONSOLIDATED GAS COMPANY.

Total actual 1st cost of Buildings & Structures....	$30,000	
Total actual 1st cost of Chimney................	3,000	
		$33,000
Total gas machinery and apparatus.............		18,450
Total yard connection (Meyer).................		47,714
Total gas holder and tank.....................		394,000
Actual present value of 132nd St. Station........		$493,164

5102 INVENTORIES OF BUILDINGS AND APPARATUS OF THE 132ND STREET GAS WORKS OF THE CONSOLIDATED GAS COMPANY OF NEW YORK CITY, 1906.

	Buildings only.	Total cost.	Values not computed.
1	Governor & Boiler House.........	30,000.00	
2	Boiler Chimney.................		3,000.00
		30,000.00	3,000.00
	Value Not Computed, c. f.......	3,000.00	
		33,000.00	

	Apparatus only.	Act. cost.	Dep. cost.
3	Governor & Boiler House, 1 #11½ Vertical Exhauster.............	3,000.00	
4	One 16½ x 24 Hor. Buckeye Engine	3,000.00	
5	One 24 in. Connelley Gas Cov.....	1,200.00	
6	3 B. & W. Boilers and 2 Batteries..	8,000.00	
7	One 6 x 4 Knowles Dup. Plunger Pump	150.00	
8	One #6 Cockrane Feed Water Heater	500.00	
9	One #10 Steel Plate Breeching....	750.00	
10	One 3 in. Crown Water Heater....	150.00	
11	One #12½ Metropolitan Injector..		
12	One Blow-off Tank, 3 in. x 10.....	100.00	
13	One 8 in. Hudson Exh. Head.....	1,500.00	
14	Toilet, etc......................	100.00	
15	Connections	18,450.00

8	Total Value of Buildings (Meyer)		
9	Total Value of Apparatus (Meyer)		
10	Total Value of Connections (Meyer)		
11	Total Value of Holders (Meyer)		
		20,300.00	

5104 Mr. Burr: I think that embraces all of them, Doctor.

The Witness: That embraces all.

Q. Take for instance the 21st Street station, the recapitulation there, you state on the second line "average, date 1874," referring to the buildings and structures. What do you mean by that?

A. Looking over the detailed items of the subsequent sheet the buildings are mentioned as having been built in 1860, in 1865, in 1873, 1874, 1883, 1890. As near as I could figure it, 1874 was the average date of the buildings, of all the buildings.

Q. Now then, in the schedule annexed to the recapitulation of inventory at 23d Street, buildings and apparatus, in the first column you have given buildings only, have you—you have taken the buildings alone?

A. The buildings alone.

Q. And the first column shows the total cost or value as given by you?

A. It does.

Q. Now, there is another column I noticed headed "Values not computed;" what do you mean by that?

A. There are certain portions of the buildings which could not very well be computed, such as—for instance foundations for a steel tank, $20,000, two little walls coming across the corner of the land and forming the small storehouse, the cubical or hollow contents of these details could not be obtained as could the cubical or hollow contents of the buildings.

Q. Point out some instance in that inventory of the buildings at the 21st Street station of which you are speaking about—foundation for steel tank?

A. Foundation for steel tank.

By Mr. MATHEWSON:

5105 Q. Does this $20,000 cover the last four items on that column, 43, 44, 45, 46?

A. It does not. Oh, yes, it does. It does. My typewriter substituted a row of zeros instead of putting in a bracket as I had put in in my original.

By Mr. BURR:

Q. In the next page showing the apparatus only, the first column shows the actual cost or value as placed by you on each item of the apparatus?

A. It does. The cost new.

Q. And the second column shows the depreciation?

A. It shows what is called the depreciated cost. I mean by that cost from which no depreciation is taken.

By Mr. MATHEWSON:

Q. Do you mean that that second column is the value after depreciation is deducted?

A. Referring to item 99 three salt water condensers, $90,000, it means that there is no depreciation taken from that price at all in the final summation.

Q. And that is true also as to items 101 and 102?

A. Yes.

Q. And the other items which appear?

A. And the subsequent items as far down as——

Q. 169 and 170?

A. 170 is the last item.

By Mr. BURR:

Q. And that is true of all the schedules which you have made and which you have handed to the stenographer regarding each of the stations?

A. That same method has been adopted with regard to each station.

Q. Have you prepared as the result now of your examination of the plants and of the mains a final estimate of the actual present value of the total investment in the works of the Consolidated Gas Company?

A. I have.

5106 Mr. Mathewson: That includes your previous estimate on mains and so forth?

Mr. Burr: Yes, and the previous testimony that has been given.

Q. By the works you mean the plants?

A. Yes, everything.

Mr. Burr: With the exception of explaining to you the other schedules which are for your information and which he has here, that will make Dr. Marks' testimony complete.

By the Master:

Q. What did I understand you to give as the total valuation of all these plants, including the buildings and apparatus, connections and holders?

A. $9,348,692.

Mr. Mathewson: That is after deductions of depreciation?

Mr. Burr: Less depreciation.

Q. Does that exclude or include so much of that 18th Street plant as was taken by the city in condemnation?

A. It excludes so much of the 18th Street station as was abandoned by the Consolidated Gas Company.

Mr. Mathewson: That is the same thing. The city took it.

Mr. Burr: That appears upon his summation of each station.

Mr. Mathewson: Do these estimates show the total estimate of the Doctor without deduction of these depreciation percentages which he has assumed?

By Mr. Burr:

5107 Q. The schedules of inventories which you prepared for each individual station, do these show the grand total without depreciation, and also with the depreciation?

A. The original structural value of every building and of every piece of apparatus is given in detail but not footed up in detail in every case. The depreciation is not given for each detail but given for the summation of all the details in each plant.

Mr. Mathewson: I do not think you quite understand what I had in mind and what I think Mr. Burr asked—that was whether the schedules show a total for plant and buildings without depreciation corresponding to that total of $9,348,692 after deduction of depreciation?

A. They do not.

By Mr. Mathewson:

Q. The totals could be figured from your schedules, could they—you have given the cost?

A. Yes.

Q. The final estimate was prepared by you and shows what are the total value of the——

A. The total actual structural cost of the Consolidated Gas Company's gas works, $23,460,020. The actual apparent present value of the Consolidated Company's investments as $31,122,452.

Q. And then what do you make the estimated cost per annual thousand cubic feet of sales based on structural cost of land and structural cost of buildings and so forth?

A. The investment per annual thousand cubic feet of sales appears to be $2.02, of which $1.18 is based upon the structural cost of land and buildings, apparatus and holders, and $0.84 is based upon the structural cost of street mains, value of services and meters.

Q. And this summary which you have perpared shows the details, upon which you base those conclusions?

A. It does, and it is as follows:

5108 FINAL ESTIMATE OF THE ACTUAL PRESENT VALUE OF THE TOTAL INVESTMENT IN THE WORKS OF THE CONSOLIDATED GAS COMPANY, NEW YORK CITY.

R. E.—		
Original cost of land to six merged Companies, City Ex. 87, p. 1562...............		$3,377,971.10
Balance cost of land transactions, Consolidated Gas Company, since 188-, City Exh., 87, p. 1576...............		740,296.28
Total....................		$4,118,267.38
Abandoned (not paid for) City's condemnation (estimated) ..		
Bulkheads at 16th, 17th and 18th Streets, Hudson R.....	$317,100.00	
Land at 18th St. Station, Parcel 4, Exhs. 48 and 49........	875,916.37	
		1,193,016.37
Actual structural (original) cost of land used for gas making.		$2,925,251.00
Mfg. Plants—		
Actual present value of operative buildings and gas apparatus		9,348,692.00

St. Mains—			
Actual structural cost of Street Mains, City Exh. 89........		$7,141,232.00	
Allowance for 620,019 ft. of obsolete 2-3-4 and 5 mains..			
Cost of 620,019 ft. 6-in. mains under new pavement ..	$1,641,655		
Cost of 620,019 ft. of Removed 2-3-4 and 5 mains....	624,435		
		1,017,220.00	
			6,124,012.00
Cost Mains in Bronx, Comp. Ex. 91......................			47,450.00
Services—			
Cost Services, Comp. Exh. 81, p. 350 (Oct. 31, 1905, Co.'s Books)			1,212,071.00
5109 Meters, Etc.—			
Cost Meters and Misc., Comp. Exh. 81, p. 350 (Oct. 31, 1905, Co.'s books).........			3,802,544.00
Total actual structural cost Cons. Co.'s Gas Works......			$23,460,020.00

(NOTE.—See Marks' Test. before Master, p. 2353, fixing $23,644,030.)

Increase in Value of Land—		
Estimated present value of land, Thompson's Est., p. 2902, Test.	$10,486,356.15	
McHale's Est., p. 2871, Test...	10,689,013.14	
Average	10,587,685.00	
Less Structural cost of land for Gas making	2,925,251.00	
Increased value accrued upon land owned by Company....		7,662,434.00
Apparent present actual value of Consolidated Gas Co.'s invests		$31,122,454.00

CONSOLIDATED GAS COMPANY.

Estimated cost per annual 1,000 cu. ft. of sales 1905.

Structural cost of land......	$2,925,251	
Structural cost of Bldg., Apparatus & Holders.......	9,348,692	
Total divided by 10,419,461 M.	12,263,943	Gives per annual M.$1.18
Structural value of street mains	6,171,462	
Structural value of services..	1,212,071	
Structural value of Meters...	3,802,544	
Total divided by 13,283,164 M.	$11,186,077	Gives per annual M.$0.84
Structural investment per annual M. (See Test. p. 2335.)		Gives per annual M.$2.02

5110 By Mr. **Burr**:

Q. Did you prepare yourself the statements which you have handed in to me and which I have handed to the stenographer?

A. I did, personally, with my own hand.

Q. In addition to what you have handed me you have also prepared in detail, have you not, inventories of the buildings and apparatus of the various works of the Consolidated Gas Company, showing so far as you have been able to ascertain regarding buildings the date of installation or erection, the actual cost as given by Rowland in 1884, the cost given by Mr. Mayer in 1906, the cost with depreciation shown given by Mr. Mayer in 1906, the ground area, the cubical contents of the superstructure, cost per square foot, cost per cubic foot, cubical contents including basements, cost per cubic foot and total cost?

A. I have.

Q. And these you have here with you now, have you?

A. I have.

Mr. **Mathewson**: I do not understand that that schedule you just referred to you intend to put on the record at all. I do not think it would be valuable and I do not think it is possible to take Mr. Rowland's figures on buildings and apply them to the buildings as they exist to-day, without taking into account the replacements and additions and one thing or another that have been made and say they are comparisons with the same buildings, and for that reason, among others, I should object if you wanted to offer it. So far as a tabulation is concerned, that is another thing.

Mr. **Burr**: The buildings in Rowland's appraisement were
5111 described and the sizes given just the same as Mr. Mayer has
described them and given the sizes in 1906.

Mr. Mathewson: They have differed materially, many of them, in construction, in one way or another. In addition, Mr. Mayer, when he estimated put the foundations of apparatus in his cost of buildings while Rowland did not, as I understand it.

Mr. Burr: I ask to have these various inventories marked for identification.

The papers are marked as follows:

21st St. plant, City's Ex. for identification	125
42d St. plant, City's Ex. for identification	126
99th St. plant, City's Ex. for identification	127
44th St. plant, City's Ex. for identification	128
Inwood plant, City's Ex. for identification	129
111th St. plant, City's Ex. for identification	130
132d St. plant, City's Ex. for identification	131
18th St. plant, City's Ex. for identification	132
63d St. plant, City's Ex. for identification	133
65th St. plant, City's Ex. for identification	134
14th St. plant, City's Ex. for identification	135

Mr. Burr: That is all that I desire to ask of Dr. Marks, and under the agreement which seems to have been arrived at, the next in order is the testimony of the other witness with regard to the valuation of these plants.

Mr. Mathewson: You mean Mr. Edgerton?

Mr. Burr: Mr. Edgerton.

Mr. Mathewson: I understand that Mr. Edgerton's figures are completed and that they are merely being tabulated and written out.

Mr. Kirby: That is quite so, Mr. Mathewson. Mr. Edgerton has prepared schedules in somewhat different form to be sure,
5112 from those of Dr. Marks, but none the less giving the details as in pretty much the same method used by Dr. Marks. They are not as yet from the typewriter, and we will not be in a position to present them until Monday morning. They will give the cost, the depreciation and the value of the buildings and the apparatus, the holders and tanks and the yard connections, following the order used by Mr. Marks.

The Master: And you will put them in succinctly as Mr. Burr has done, just calling a witness and putting the schedules in?

Mr. Kirby: Yes, Mr. Master.

The Master: Then your direct-examination will not take say over an hour?

Mr. Kirby: Probably half an hour.

Mr. Mathewson: Do I understand that that ends all the defendant's cases?

Mr. Kirby: It ends our case.

Mr. Burr: It ends my case except I may want to read some evidence on the record. That is all.

The Master: How about the suggestion of something about Prof. Bemis that was made at the last hearing?

Mr. Burr: I have received a letter from Dr. Bemis saying that he

is convalescent. He is anxious to come on but we are not anxious to have him come on until he has entirely recovered, it being a malignant disease which he has suffered from. I wanted to get in simply, and I think Brother Mathewson could well afford to allow it in without any more ado, the authenticity of the letters showing the increase in population, the ratio of increase in population in the Borough of Manhattan, City of New York, coming from the
5113 public officials of Washington, and the letters showing that there has been a reduction in the price of gas at Lynn. Now, that is all that I would have to call him to give testimony regarding, and I would not like to hold up or hold our case unclosed for that reason. I think Mr. Mathewson on second thought can well say that he has no objection to allowing us to put*ting* them in. With that exception, and calling your attention to various papers, that would be the end of our case. We ought not consume—we will not consume Monday in finishing up our defence.

Mr. Mathewson: I think, Mr. Master, in view of the terms of the Court's order and in view of the manner in which the defence is introduced that I should not cross-examine these witnesses until they have completed their testimony on value of plants. I do not see how I very profitably could do so.

The Master: Well, that seems to have been the sense of opinion among counsel, that you had better have both statements in as to values.

Mr. Kirby: It is quite immaterial to us. We can go on on Monday morning with Mr. Edgerton and our testimony will be put in in the manner which I have indicated, or if Mr. Mathewson prefers he can take up the cross-examination of Dr. Marks.

Mr. Mathewson: No. Mr. Kirby, it may be quite likely that the cross-examination of one witness on a certain point may bring out the situation clearly so that I would not have to touch the next witness, at all on that same point, and I do not think we would gain time. Besides, I think that I am entitled under the order
5114 of the Court, as it is construed, and also as it is Mr. Burr's view, to have your testimony first presented and then I will cross-examine.

Mr. Kirby: Very good, sir.

The Master: Can you proceed, Mr. Burr, with such documentary evidence as you say you want to put in? You said you were going to read something in evidence. Can you do that now?

Mr. Burr: No, I can do that on Monday. I haven't even made up my mind that it will be necessary.

The Master: Then apparently there is nothing more we can do to-day, in which case we will adjourn until Monday, January 7, 1907, at 10.30 A. M.

Adjourned to January 7, 1907, at 10.30 A. M.

Last Exhibits:
Complainant's 270.
State's OOO.
City's 135.

5115 Circuit Court of the United States, Southern District of New York.

Consolidated Gas Company of New York, Complainant,
vs.
Julius M. Mayer, as Attorney General of the State of New York; William Travers Jerome, as District Attorney of New York County; Frederick E. Gunnison, John C. Davies, and Lucian L. Shedden, Constituting the New York State Commission of Gas and Electricity, and The City of New York, Defendants.

Before Arthur H. Masten, Special Master.

New York, *January* 7, 1907—10.30 a. m.

(Met pursuant to adjournment.)
Present: The Master, Mr. Mathewson, Mr. Burr, Mr. Page, Mr. Kirby.

5116 Henry H. Edgerton, recalled on behalf of the State.

Direct examination by Mr. Page:

Q. Have you inspected and examined all the plants of the Consolidated Gas Company on the Island of Manhattan?

A. Yes, sir.

Q. Have you made an appraisal of these plants exclusive of the real estate upon which they are situated?

A. I have.

Q. In making this appraisal did you make up an inventory of your own, or did you adopt the inventory furnished by Mr. Mayer?

A. I used Mr. Mayer's inventory and his measurements with the exception of a few where I made my own and checked—I did not have an opportunity to enter into all the measurements.

Q. Did you make some measurements yourself?

A. I did.

Q. Did you compare these measurements with those given by Mr. Mayer in his testimony or in his inventory as furnished?

A. Yes.

Q. Did you find the measurements given by Mr. Mayer to be in all instances correct?

A. No, sir; not in all instances, no, sir.

Q. In making your appraisal of the yard connections did you inspect and examine the yard connections?

A. As much as was possible, but most of these connections were underground and therefore in regard to the value of the yard connections I had to base it on the capacity of the plant as is usually required for the output of gas for the plants. That is, there is a certain factor that will give the ordinary connection necessary for gas and tar throughout the works, and I adopted that in place of a complete measurement of the connections. Another reason being that those works have been changed a number of times. They

started out as coal gas works, and then changed to Tessie du Motay process works, and then into Lowe process works, which in-
5117 volved undoubtedly a considerable amount of duplication.

Q. How long have you been engaged in making your appraisal?

A. About three weeks, in addition to the time taken before this last effort to get an appraisal.

Q. When did you complete the appraisal and preparation?

A. I completed it on Friday up — the point of getting it together and having it typewritten and put in shape on Friday evening.

Q. Have you made any change in your appraisal since Friday evening?

A. No, sir, I have not; except I started out to correct certain errors I saw in the typewritten report in regard to a duplication of some of the amounts, particular cases where Mr. Mayer's appraisal and my own had been added together.

Q. During the time that you have been engaged in making your appraisal have you been in consultation with Mr. Marks, the expert for the city?

A. No, sir, I have not. I have not met Dr. Marks except at the first station—the 14th Street station, where we went through together with Engineer Lacombe.

Q. Now, have you the appraisal as prepared by you?

A. I have.

Q. Will you explain how this has been prepared—I mean the manner of this arrangement?

A. The work has been taken station by station and the buildings aggregated, the apparatus, following the division adopted by Mr. Mayer, and then the details calculated out and corrected by myself and aggregated into this typewritten copy.

Q. Now, in the 14th Street station, how have you prepared your values of apparatus?

A. In regard to the 14th Street plant there was some of the apparatus that I was not enabled to calculate and I adopted Mr. Mayer's figures for the reason that I had not any opportunity to make a calculation of my own.

5118 Q. And how about your former testimony as to the 14th Street plant?

A. Yes, substantially, as far as I checked it off and compared it, it agrees with my former testimony in regard to the 14th Street station, and is entered in the appraisal in that shape.

Q. And you have, as I understand, for such items of apparatus on which you agree with the figures given by Mr. Mayer, or as to certain machinery where you had not the information, adopted Mr. Mayer's appraisal and carried that out in this appraisal of yours?

A. I have. There were many small items and some large ones that I was unable to calculate out or get an account of on account of the number.

Q. You have figured as to each item the depreciation by reason of physical deterioration?

A. I have. I put on the depreciation figure as near as I could arrive at it. I had some trouble in arriving at some of the machinery on account of the depreciation going on interiorly and not knowing exactly the age the depreciation figure is put down according to its appearance and the amount of usage it apparently had.

Mr. PAGE: Now, we will offer in evidence the schedule which the witness has prepared.

Mr. MATHEWSON: It is offered as part of his testimony rather than to have him repeat it orally?

Mr. PAGE: Yes, that is the idea, as long as you are going to take time to cross-examine him I thought that would be the better way.

Mr. MATHEWSON: Yes; I have no objection to taking it in in that way. I object, however, on the ground that the witness has not been shown competent to testify to values in the City of New York.

Objection overruled.

Exception.

The WITNESS: My schedules of the various plants are as follows:

5119

CONSOLIDATED GAS COMPANY.

Value of all Plants January, 1907.

Fourteenth Street	$1,405,966.00

Total	$9,367,344.25
Add to above values for engineering, superintendence and inspection, 3 per cent	281,020.00
Add for interest on moneys necessary to be used during construction, 4 per cent	374,693.00
Complete value	$10,023,057.25

FOURTEENTH STREET PLANT.

Summary of Values, January, 1907.

Buildings	$334,960.00
Apparatus	498,806.00
Yard Connections	25,500.00
Holders and Tanks	546,700.00
	$1,405,966.00

5120 FOURTEENTH STREET STATION BUILDINGS.

Office Building (Mayer, p. 1351).

42 ft. x 32 ft. 6 in. x 23 ft. 9 in.

Cost to build, complete, new materials...	$5,750	
Depreciation by reason of physical deterioration, 15 per cent.		
Value		$4,890

Pay Room (Mayer, p. 1351).

2 Story brick building, 12 in. wall, 28 ft. 1 in. x 13 ft. 1 in. x 23 in.

Cost to build complete, new materials...	$3,000	
Depreciation by reason of physical deterioration, 15 per cent.		
Value		$2,550

Building Over Alley (Mayer, p. 1351).

1 Story, 11 ft. wide, 28 ft. 1 in. x 10 ft. 10 in.

Cost to build complete, new materials...	$650	
Depreciation by reason of physical deterioration, 15 per cent.		
Value		$550

Store Room (Mayer, p. 1351).

2 Story building, 21 ft. 9 in. x 28 ft. 1 in. by 23 ft. high.

Cost to build complete, new materials...	$2,800	
Depreciation by reason of physical deterioration, 15 per cent.		
Value		$2,400

Boiler Room (Mayer, p. 1351).

1 Story building, 28 ft. x 44 ft. x 28 ft. high.

Cost to build complete, new materials...	$3,500	
Depreciation by reason of physical deterioration, 15 per cent.		
Value		$3,000

5121 Engine Room (Mayer, p. 1351).

2 Story building and attic, 44 ft. x 13 ft. 10 in. x 24 ft. 9 in.

Cost to build complete, new materials...	$4,800	
Depreciation by reason of physical deterioration, 15 per cent.		
Value		$4,080

Exhauster House (Mayer, p. 1351).

2 Story building, 28 ft. 1 in. by 20 ft. 6 in. x 23 ft. high.

Cost to build complete, new materials...	$4,200	
Depreciation by reason of physical deterioration, 15 per cent.		
Value		$3,570

Machine Shop and Store (Mayer, p. 1351).

47 ft. x 28 ft. x 23 ft.

Cost to build complete, new materials...	$4,200	
Depreciation by reason of physical deterioration, 15 per cent.		
Value.		$3,570

Smith Shop (Mayer, p. 1351).

35 ft. x 52 ft. 2 in. by 23 ft.

(Dimensions stated in Schedule as 38 ft. x 52 ft. 2 in. x 23 ft., latter used in making estimate).

Cost to build complete, new materials...	$5,300	
Depreciation by reason of physical deterioration, 15 per cent.		
Value		$4,500

Condenser House (Mayer, p. 1351).

1 Story building, 54 ft. 1 in. x 34 ft. 6 in. x 27 ft. high.

Cost to build complete, new materials...	$7,500	
Depreciation by reason of physical deterioration, 15 per cent.		
Value		$6,400

5122

Shed (Mayer, p. 1351).

1 Story building, galvanized iron sides, 38 ft. 3 in. x 38 ft. x 11 ft. 6 in. high.

Cost to build complete, new materials...		$3,000	
Depreciation by reason of physical deterioration, 10 per cent.			
Value.	$2,700		
Deduct for unnecessary Pile Foundations	1,000		
			$1,700

Large Purifier (Mayer, p. 1351).

Purifier House, 67 ft. x 127 ft. x 24 ft. high.

Cost to build complete, new materials...	$33,000	
Depreciation by reason of physical deterioration, 15 per cent.		
Value		$28,000

Small Purifier House (Mayer, p. 1351).

40 ft. 5 in. 67 ft. x 16 ft. 6 in.

Cost to build complete, new materials...	$11,500	
Depreciation by reason of physical deterioration, 15 per cent.		
Value		$10,000

Oxide House (Mayer, p. 1351).

37 ft. 10 in. x 67 ft. x 16 ft. 6 in. high.

Cost to build complete, new materials...	$6,300	
Depreciation by reason of physical deterioration, 15 per cent.		
Value		$5,400

METER HOUSE (Mayer, p. 1351).

33 ft. 7 in. x 40 ft. 4 in. by 24 ft. high.

Cost to build complete, new materials...	$6,000	
Depreciation by reason of physical deterioration, 10 per cent.		
Value		$5,400

5123 CENTER SEAL HOUSE (Mayer, p. 1352).

16 ft. x 16 ft. 2 in. x 14 ft. 9 in. high.

Cost to build complete, new materials...	$1,500	
Depreciation by reason of physical deterioration, 10 per cent.		
Value		$1,350

CENTER SEAL HOUSE (Mayer, 1352).

(Dimensions as above.)

Cost to build complete................	$1,500	
Depreciation bv reason of physical deterioration, 10 per cent.		
Value		$1,350

BOILER HOUSE (Mayer, p. 1352).

1-story brick building 15 ft. 2 in. x 38 ft. 10 in. x 16 ft. 6 in.

Cost to build complete, new materials...	$4,500	
Depreciation by reason of physical deterioration, 10 per cent.		
Value		$4,000

VALVE HOUSE (Mayer, p. 1352).

1-story and basement brick building, 12 ft. 3 in. x 21 ft. 4 in. x 12 ft. 6 in.

Cost to build complete, new materials...	$1,000	
Depreciation by reason of physical deterioration, 10 per cent.		
Value		$900

RETORT HOUSE (Mayer, p. 1352).

1-story brick building, 185 ft. 9 in. x 245 ft. 4 in. x 22 ft. 9 in.

Cost to build complete, new materials...	$80,000	
Depreciation by reason of physical deterioration, 20 per cent.		
Value.		$60,000

5124 SCRUBBER HOUSE (Mayer, p. 1352).

1-story brick building, 48 ft. 3 in. x 12 ft. x 16 ft. 5 in.

Cost to build complete, new materials...	$2,100	
Depreciation by reason of physical deterioration, 15 per cent.		
Value		$1,800

BRICK WALL AROUND HOLDER YARD.

(Mayer, p. 1352).

North wall, 351 ft. 2 in. long; south wall, 366 ft. 6 in.; west wall, 207 ft.

Cost to build complete, new materials...	$13,500	
Depreciation by reason of physical deterioration, 20 per cent.		
Value		$10,800

WALL BETWEEN AVES. C & D (Mayer, p. 1352).

23 ft. 7 in. on 14th Street and 245 ft. 4 in. on 15th Street, etc.

Cost to build complete, new materials...	$9,000	
Depreciation by reason of physical deterioration, 20 per cent.		
Value		$7,200

SHED (Mayer, p. 1353).

75 ft. 6 in. x 21 ft. 6 in. x 17 ft.

Cost to build complete, new materials...	$3,500	
Depreciation by reason of physical deterioration, 10 per cent.		
Value		$3,200

SHED (Mayer, p. 1353).

(Dimensions as above.)

Cost to build complete, new materials...	$3,500	
Depreciation by reason of physical deterioration, 10 per cent.		
Value		$3,200

5125

COKE STORAGE (Mayer, p. 1353).

131 ft. 6 in. x 63 ft. 8 in.

Cost to build complete, new materials...	$9,500	
Depreciation due to physical deterioration, 25 per cent.		
Value		$7,000

GAS ENGINE HOUSE (Mayer, p. 1353).

1-story brick building, 13 ft. 3 in. x 41 ft. 6 in. x 11 ft. 3 in.

Cost to build complete, new materials...	$1,000	
Depreciation due to physical deterioration, 10 per cent.		
Value		$900

COAL HOPPER (Mayer, p. 1353).

21 ft. 6 in. x 36 ft. x 32 ft. 7 in., 1 story.

Cost to build complete, new materials...	$4,000	
Depreciation due to physical deterioration, 10 per cent.		
Value		$3,600

COAL SHED (Mayer, p. 1353).

1-story brick building, 184 ft. 5 in. x 206 ft. 6 in. x 26 ft. 6 in.

Cost to build complete, new materials... $70,000
Depreciation by reason of physical deterioration, 10 per cent.
Value $63,000

RIGGING HOUSE (Mayer, p. 1353).

2-story building, 22 ft. long x 13 ft. 6 in. x 20 ft. high (end of coal shed).

Cost to build complete, new materials... $700
Depreciation by reason of physical deterioration, 10 per cent.
Value $630

5126 SMALL OFFICE BUILDING (Mayer, p. 1353).

10 ft. x 10 ft. x 10 ft. high.

Cost to build complete, new material.... $100
Depreciation by reason of physical deterioration, 20 per cent.
Value $80

COAL & COKE STORAGE (Mayer, p. 1353).

Walls of various dimensions as set down in testimony.

Cost to build complete, new material.... $20,000
Depreciation by reason of physical deterioration, 20 per cent.
Value $16,000

BOILER ENGINE HOUSE (Mayer, p. 1353).

1-story brick building, 11 ft. x 25 ft. x 20 ft.

Cost to build complete, new material.... $2,500
Depreciation by reason of physical deterioration, 10 per cent.
Value $2,250

BOILER HOUSE (Mayer, p. 1353).

16 ft. x 28 ft. 1 in. x 11 ft.

Cost to build complete, new materials... $1,200
Depreciation by reason of physical deterioration, 15 per cent.
Value $1,000

CIRCULAR BRICK BUILDING (Mayer, p. 1353).

11 ft. diameter, 54 ft. high.

Cost to build complete, new materials...	$1,500	
Depreciation by reason of physical deterioration, 10 per cent.		
Value		$1,350

5127 BOILER HOUSE (Mayer, p. 1353).

1-story frame building, 32 ft. 5 in. x 16 ft. x 11 ft. 6 in.

Cost to build complete, new materials...	$1,300	
Depreciation by reason of physical deterioration, 15 per cent.		
Value		$1,100

VALVE HOUSE (Mayer, p. 1353).

1-story frame building, 12 ft. 4 in. x 10 ft. 4 in. x 9 ft. 6 in.

Cost to build complete, new materials...	$200	
Depreciation by reason of physical deterioration, 15 per cent.		
Value		$170

EXHAUSTER HOUSE (Mayer, p. 1353).

1-story and basement brick building, 50 ft. 8 in. x 43 ft. 4 in. x 20 ft. 3 in.

Cost to build complete, new materials...	$15,000	
Depreciation by reason of physical deterioration, 5 per cent.		
Value		$14,250

BOILER HOUSE (Mayer, p. 1354).

1-story brick building, 27 ft. 8 in. x 32 ft. x 20 ft. 2 in.

Cost to build complete, new materials...	$3,500	
Depreciation by reason of physical deterioration, 15 per cent.		
Value		$3,000

COKE OFFICE (Mayer, p. 1354).

1-story brick building, 9 ft. 5 in. x 15 ft. 5½ in. x 13 ft. 10 in.

Cost to build complete, new materials...	$650	
Depreciation by reason of physical deterioration, 15 per cent.		
Value		$550

5128 BOILER HOUSE (Mayer, p. 1354).

1-story brick building, 18 ft. 5 in. x 19 ft. 2½ in. x 17 ft. ½ in., or an average of 16 ft. high.

Cost to build complete, new materials... $4,000
Depreciation by reason of physical deterioration, 15 per cent.
Value $3,400

CLAY MILL & STORAGE (Mayer, p. 1354).

1-story frame building, 17 ft. ½ in. x 29 ft. 6 in. x 12 ft. 3½ in. x 20 ft. 3 in. x 19 ft. ½ in. x 14 ft. 9 in.

Cost to build complete, new materials... $850
Depreciation by reason of physical deterioration, 20 per cent.
Value $700

STORAGE SHED (Mayer, p. 1354).

1 open frame shed, 33 ft. 5½ in. x 40 ft. x 9 ft. 10 in.

Cost to build complete, new materials... $900
Depreciation by reason of physical deterioration, 15 per cent.
Value $750

SHED (Description as above).

36 ft. 1 in. x 19 ft. 4 in. x 8 ft. 11 in. high.

Cost to build complete, new materials... $400
Depreciation by reason of physical deterioration, 15 per cent.
Value $350

STABLE (Mayer, 1354).

2-story brick building, 50 ft. x 32 ft. 1 in. x 26 ft. 11½ in.

Cost to build complete, new materials. $5,000
Depreciation by reason of physical deterioration, 15 per cent.
Value $4,250

5129 STORAGE SHED (Mayer, 1354).

1-story open frame building, 19 ft. 6 in. x 84 ft. 11 in. x 11 ft. 4½ in.

Cost to build complete, new materials... $1,000
Depreciation by reason of physical deterioration, 10 per cent.
Value $900

CARRIAGE ROOM, CALLED SHED NO. 1.

(Mayer, p. 1354).

1-story frame building, 19 ft. 10 in. x 19 ft. 10 in. x 10 ft. 4½ in.

Cost to build complete, new materials...	$400	
Depreciation by reason of physical deterioration, 10 per cent.		
Value		$360

PUMP HOUSE (Mayer, 1354).

1-story frame building, 11 ft. x 13 ft. 2 in. x 8 ft. 6 in.

Cost to build complete, new materials...	$175	
Depreciation by reason of physical deterioration, 10 per cent.		
Value		$160

STORAGE SHED (Mayer, p. 1354).

1-story brick building, 20 ft. 9 in. x 46 ft. 8 in. x 12 ft. 10 in.

Cost to build complete, new materials...	$1,300	
Depreciation by reason of physical deterioration, 15 per cent.		
Value		$1,100

ANOTHER STORAGE BUILDING (Mayer, p. 1354).

1-story brick building, 21 ft. x 36 ft. 4 in. x 12 ft. 10 in. high.

Cost to build complete, new materials...	$1,800	
Depreciation by reason of physical deterioration, 20 per cent.		
Value		$1,400

5130 ANOTHER STORAGE SHED (Mayer, p. 1354).

25 ft. 10 in. x 31 ft. 2 in. x 10 ft. high.

Cost to build complete, new materials...	$400	
Depreciation by reason of physical deterioration, 20 per cent.		
Value		$320

FENCES (Mayer, p. 1355).

Distances as set down in testimony and in schedules.

Cost to build complete, new materials...	$5,000	
Depreciation by reason of physical deterioration, 15 per cent.		
Value		$4,200

PAVING AND HOLDING YARD (Mayer, p. 1355).

11,140 sq. ft. of brick laid flat.

Cost to build complete, new material....	$1,400	
Depreciation by reason of physical deterioration, 20 per cent.		
Value		$1,100

BOILER HOUSE (Mayer, 1355).

1-story brick building, 18 ft. 4 in. x 20 ft. x 20 ft. 9 in. long.

Cost to build complete, new materials...	$3,000	
Depreciation by reason of physical deterioration, 15 per cent.		
Value		$2,500

WEIGH OFFICE (Mayer, p. 1355).

1-story and basement brick building, 16 ft. 5 in. x 26 ft. 6 in. x 13 ft. 2 in.

Cost to build complete, new materials...	$2,000	
Depreciation by reason of physical deterioration, 20 per cent.		
Value		$1,600

5131

STORAGE BUILDING (Mayer, p. 1355).

1-story brick building 8 ft. x 7 ft. 11 in. x 7 ft.

Cost to build complete, new materials...	$175	
Depreciation by reason of physical deterioration, 20 per cent.		
Value		$120

ANOTHER VALVE HOUSE (Mayer, p. 1355).

10 ft. x 7 ft. x 12 ft.

Cost to build complete, new materials...	$130	
Depreciation by reason of physical deterioration, 20 per cent.		
Value		$100

ANOTHER BOILER HOUSE (Mayer, p. 1355).

14 ft. x 20 ft. x 15 ft.

Cost to build complete, new materials...	$450	
Depreciation by reason of physical deterioration, 20 per cent.		
Value		$360

PILE FOUNDATIONS NORTH SIDE OF FIFTEENTH STREET.

No specifications given.

Value ....

PORTION OF NEWLY ERECTED BOILER HOUSE IN COURSE OF CONSTRUCTION.

FOUNDATIONS FOR TOWER SCRUBBERS.

(Mayer, p. 1355).

Cost to build complete, new materials...	$7,000	
Depreciation by reason of physical deterioration, 5 per cent.		
Value		$6,600

5132 FOURTEENTH STREET STATION.

Recapitulation.

Value of all buildings complete, together with all foundations contained therein or thereunder, whether the same be for the buildings or for the apparatus....	$324,960	
Add for grading, paving, draining and various improvements..............	10,000	
Value of above......................		$334,960
Value as given by Mr. Mayer (p. 1355).		691,961

CONSOLIDATED GAS COMPANY, FOURTEENTH STREET STATION.

OFFICE BUILDING.

Contents:

(Mayer, p. 1356; Edgerton, p. 4620.)

Depreciation, due to physical deterioration, as per Edgerton, 40 per cent..		$1,068.00

STORE ROOM.

Contents:

(Mayer, p. 1358.)

As per Mayer....................	100.00

BOILER ROOM.

(Mayer, p. 1358; Edgerton, pp. 4621 & 4626.)

Rowland Engine.		
Cost, new and complete	$1,800.00	
Depreciation, due to physical deterioration, 25 per cent.		
Value		1,350.00
1 Clark Steam & Fire Regulation Regulator.		
Value as per Mayer		25.00

(Edgerton, p. 4628.)

Cast Iron Tank.		
Value, with depreciation off		2,500.00

5133 RETORT HOUSE.

(Mayer, p. 1411; Edgerton, p. 4642.)

4 Coal Stacks of 30 Benches each.		
Cost to build, complete	$160,000.00	
Depreciation, by reason of physical deterioration	6,300.00	
Value		153,700.00
1 Stack of 24 Benches.		
Cost to build, complete	$36,500.00	
No depreciation value		$36,500.00

Mr. Edgerton has included in his appraisal the hydraulic mains and iron work, doors, etc., to all the benches, the same as Mr. Mayer, p. 1414.

Stoking Machines.

(Mayer, p. 1414.)

Value as per Mayer	15,200.00 4,180.00 9,975.00

Drawing Machines.

Value as per Mayer	24,500.00 5,130.00

6 Turn-Tables.

(Mayer, p. 1415.)

Value as per Mayer	3,780.00

6 Lines of Track.

(Mayer, p. 1415; Edgerton, 4647.)

Cost to build, complete	4,830.00	
Depreciation, 10 per cent. per year, at least	307.00	
Value not exceeding		4,423.00

Coke Tracks.

(Mayer, p. 1416; Edgerton, 4648.)

Depreciation, not given.
Value per Mayer.................. 1,350.00

5134 2 Coke Dumping Inclines.

(Mayer, p. 1416.)

Cost to build new.................. 1,000.00
Depreciation, not given.
Value not exceeding............... 1,000.00

2 7-H. P. Engines, etc.

(Mayer, p. 1416; Edgerton, 4648.)

Cost, new......................... 400.00
Depreciation, 20 per cent.
Value 320.00

9 Self-Dumping Coke Machines.

(Mayer, p. 1417.)

Value as per Mayer................ 1,125.00

2 Coke Dumping Inclines.

(Mayer, p. 1416.)

Value as per Mayer................ 22,070.00

Coke Drums, etc.

(Mayer, p. 1417.)

Holders and Tanks	439,800.00
	$1,110,878.00

FORTY-FOURTH STREET STATION BUILDINGS.

GOVERNOR HOUSE (Mayer, pgs. 1366 and 1516).

Octagonal building, 11 ft. 2½ in. between parallel sides; 16 ft. high.

Cost to build complete with new material	$3,300	
Depreciation, add to physical deterioration, 10 per cent.		
Value		$3,000

VALVE HOUSE (Mayer, pgs. 1366 and 1516).

Octagonal building, 9 ft. 7 in. between parallel sides, 18 ft. 6 in. high.

Cost, etc. $2,875
Depreciation, 10 per cent.
Value $2,600

5157 CARPENTER SHOP (Mayer, pgs. 1366 and 1516).

Two-story brick building, 26 ft. by 35 ft. 6 in. by 30 ft.

Cost, etc............................. $3,350
Depreciation, 10 per cent.
Value $3,000

LUMBER SHED (Mayer, pgs. 1366 and 1516).

25 ft. by 28 ft. by 22 ft.

Cost $415
Depreciation, 10 per cent.
Value $370

PURIFYING HOUSE (Mayer, pgs. 1366 and 1516).

One-story brick building, 155 ft. 9 in. by 65 ft. 8 in. by 30 ft.

Cost, etc............................. $28,000
Depreciation, 10 per cent.
Value $25,000

METER HOUSE (Mayer, pgs. 1366 and 1516).

Two-story brick building, 43 ft. 9 in. by 45 ft. 1 in. by 37 ft. 6 in.

Cost, etc............................. $14,000
Depreciation, 15 per cent.
Value $12,000

CONDENSER & SCRUBBER HOUSE.

(Mayer, pgs. 1366 and 1516.)

44 ft. 10 in. by 49 ft. 8 in. by 32 ft. 10 in.

Cost, etc............................. $14,700
Depreciation, 5 per cent.
Value $14,000

ENGINE, EXHAUST & BLOWER HOUSE.

(Mayer, pgs. 1366 and 1516.)

Cost, etc............................. $27,250
Depreciation, 5 per cent.
Value $26,000

5158 GENERATOR & BOILER HOUSE.

(Mayer, pgs. 1366 and 1516.)

Two-story brick building, 139 ft. 9 in. by 65 ft. 10 in. by 27 ft.

Cost, etc.	$44,830	
Depreciation, 15 per cent.		
Value		$38,000

RETORT HOUSE (Mayer, pgs. 1366 and 1516).

One-story brick building, 207 ft. by 65 ft. by 21 ft.

Cost, etc.	$32,000	
Depreciation, 15 per cent.		
Value		$27,500

COAL HOISTS (Mayer, pgs. 1366 and 1516).

Wooden frame structure.

Value	$228

(Mayer figure taken.)

CONCRETE MIXER & ENGINE BUILDING.

(Mayer, pgs. 1366 and 1516.)

25 ft. by 16 ft. by 9 ft.

Value	452

(Mayer's Figure taken.)

STORAGE TANK BUILDING.

(Mayer, pgs. 1366 and 1516.)

12 ft. by 12 ft. by 12 ft.

Value	$342

(Mayer's Figure taken.)

OIL PUMP HOUSE (Mayer, pgs. 1366 and 1517).

28 ft. 9 in. by 18 ft. 9 in. by 27 ft. 3 in.

Cost, etc.	$3,300	
Depreciation, 15 per cent.		
Value		$2,800

5159 TAR SEPARATORS (Mayer, pgs. 1316 and 1517).

Foundations, etc.

Cost, etc.	
Value	$1,775

(Mayer's Figure taken).

COAL SHED (Mayer, pgs. 1316 and 1517).

Frame structure, 118 ft. 9 in. by 69 ft. 9 in. by 32 ft. high.

Cost, etc.	12,000	
Depreciation, 25 per cent.		
Value		$9,000

SCALE BUILDING (Mayer, pgs. 1367 and 1517).

Cost, etc.	$200	
Depreciation, 10 per cent.		
Value		$180

WATER TOWER (Mayer, pgs. 1367 and 1517).

Two-story circular brick building, 20 ft. diameter by 25 ft. high.

Cost, etc.	$2,260	
Depreciation, 10 per cent.		
Value		$2,000

EXHAUSTER HOUSE (Mayer, pgs. 1367 and 1517).

Two-story brick building, 25 ft. by 27 ft. by 20 ft.

Cost, etc.	$4,000	
Depreciation, 15 per cent.		
Value		$3,400

LIME SHED (Mayer, pgs. 1367 and 1517).

104 ft. by 75 ft. by 14 ft.

Cost, etc.	$2,000	
Depreciation, 10 per cent.		
Value		$1,800

5160 PURIFYING AND METER HOUSE.

(Mayer, pgs. 1367 and 1517.)

Brick building, 132 ft. 3 in. by 65 ft. by 25 ft. 6 in.

Cost, etc.	$35,600	
Depreciation, 15 per cent.		
Value		$30,000

STABLE (Mayer, pgs. 1367 and 1517).

60 ft. by 45 ft. by 20 ft.

Cost, etc.	$15,000	
Depreciation, 10 per cent.		
Value		$13,500

TOOL SHOP (Mayer, pgs. 1317 and 1517).

One-story brick building, 37 ft. 7 in. by 26 ft. by 16 ft.

Cost, etc.	$1,500	
Depreciation, 10 per cent.		
Value		$1,350

STORE HOUSE (Mayer, pgs. 1367 and 1517).

Brick building, 24 ft. by 24 ft. 3 in. by 16 ft. 3 in.

Cost, etc.	$1,200	
Depreciation, 25 per cent.		
Value		$800

SMALL BRICK BUILDING.

(Mayer, pgs. 1367 and 1517.)

10 ft. by 10 ft. by 20 ft.

Cost, etc.	$400	
Depreciation, 15 per cent.		
Value		$340

FRAME SHED (Mayer, pgs. 1367 and 1517).

10 ft. by 8 ft. by 8 ft.

Cost, etc.	$250	
Depreciation, 5 per cent.		
Value		$235

5161 BLACKSMITH SHOP (Mayer, pgs. 1367 and 1517).

Frame building, 15 ft. by 35 ft. by 16 ft.

Cost, etc.	$500	
Depreciation, 60 per cent.		
Value		$200

PIPE HOUSE (Mayer, pgs. 1367 and 1517).

Value (as per Mayer)	$55

PUMP HOUSE (Mayer, pgs. 1367 and 1517).

Value (as per Mayer)	$44

BRICK WALLS AROUND WORKS.

(Mayer, pgs. 1367 and 1517.)

(Includes all improvements.)

Value	$35,000

ALL BRICK WALLS & TIMBER FENCES.

(Mayer, pg. 1517.)

Value (as per Mayer)............	$2,860

SHED OVER OIL TANKS.

(Mayer, pgs. 1367 and 1517.)

Value (as per Mayer)............	$188

FOUNDATIONS FOR SALT WATER CONDENSER.

(Mayer, pgs. 1367 and 1517.)

Value (as per Mayer)............	$489

FOUNDATION FOR HOT SCRUBBER.

(Mayer, pgs. 1367 and 1517.)

Value (as per Mayer)............	$353

FOUNDATIONS FOR AIR CONDENSER.

(Mayer, pgs. 1367 and 1517.)

Value (as per Mayer)............	$752

5162

BRICK DRAINAGE TANK.

(Mayer, pgs. 1367 and 1517.)

Value (as per Mayer)............	$2,032

DRAUGHT FAN ROOM.

(Mayer, pgs. 1367 and 1517.)

Value (as per Mayer)............	$98

RECAPITULATION.

Value of all buildings, including all foundations for buildings and apparatus..........................	$261,743

(Mr. Mayer has given as to value of above, pp. 1368 & 1518, $407,767.)

APPARATUS.

(Mayer, p. 1368.)

Value, as per Mayer.................	$1,520.00

GOVERNOR HOUSE.

(Mayer, p. 1520.)

Value, as per Mayer.................		1,572.00

POWER HOUSE.

(Mayer, p. 1520.)

Contents.		
Value, as per Mayer.................		48.00

CARPENTER SHOP.

Contents.		
Value, as per Mayer.................		95.00

PURIFIER HOUSE.

(Mayer, p. 1520.)

8 purifier boxes, as described.		
Cost	28,000	
Depreciation, due to physical deterioration, 10 per cent.		
Value		25,000

5163 METER HOUSE.

(Mayer, p. 1520).

Contents.		
2 14 ft. x 14 ft. station meters, as described.		
Cost, etc.	$10,000	
Depreciation, etc., 15 per cent.		
Value		8,500
1 16 in. Wiley proportional meter and 1 small meter as described.		
Cost	6,000	
Depreciation, 15 per cent.		
Value		5,000
Office Furniture.		
(Mayer, p. 1521)		
Value, as per Mayer.................		760.00
1 bar photometer.		
(Mayer, p. 1521)		
Value, as per Mayer.................		650.00

CONDENSER AND SCRUBBER HOUSE.

CONTENTS.

(Mayer, p. 1521).

2 scrubbers, as described.		
Cost		
Depreciation, etc.		
Value		$2,400.00
2 rectangular condensers as described..	2,400	
Cost, as per Mayer..................	31,752.00	
Depreciation, 15 per cent.		
Value		26,000.00
1 Westinghouse gas meter.		
(Mayer, p. 1523)		
Value, as per Mayer................		350.00
5164 1 Pelouze & Andouin condenser.		
Cost new	1,260	
Depreciation, etc., 15 per cent.		
Value		1,071.00
Value, as per Mayer................	$1,197	

ENGINE, EXHAUSTER & BLOWER HOUSE.

2 vertical engines, made by Rowland, as described.		
Cost, new	$1,320	
Depreciation, etc., 10 per cent.		
Value		$1,188
2 Payne engines, as described.		
(Mayer, 1524)		
Cost, new	$2,750	
Depreciation, etc., 10 per cent.		
Value		2,475
1 horizontal Buck-eye engine as described.		
(Mayer, 1524)		
Cost, new	$1,800	
Depreciation, 10 per cent.		
Value		1,620
2 McKenzize exhausters.		
Cost, per Mayer..................	3,410	
Value, as per Mayer................		3,410
3 No. 10 Sturtevant blowers, as described.		
Value, as per Mayer................		1,800

1 steel blast flue.	
Value, as per Mayer................	290
1 comp. duplex pump, as described.	
Value, as per Mayer................	670
1 Davidson pump, as described. (Mayer, 1525)	
Value, as per Mayer................	772

5165 EXHAUSTER HOUSE AND BLOWER HOUSE CONTENTS.

(Mayer, 1525).

Knolls duplex pump.	
Value, as per Mayer................	$656
1 Spencer automatic damper.	
Value, as per Mayer................	250
Value	75
1 McClellan oil purifier tank.	
Value, as per Mayer................	53
1 Gild & Garrison pump.	
Value, as per Mayer................	210
1 10 x 16 Blake pump.	
Value, as per Mayer................	650
Counter shafting, pulleys, etc.	
Value, as per Mayer................	135

GENERATOR AND BOILER HOUSE CONTENTS.

(Mayer, 1525).

2 8 ft. 6 in. U. G. I. Co. sets.		
Cost, new	$20,000	
Depreciation, 10 per cent.		
Value		$18,000
4 12 ft. U. G. I. Co. sets.		
Cost, new	52,000	
Depreciation, 10 per cent.		
Value		47,000
4 Hazleton porcupine boilers, 200 h. p. (Mayer, 1526)		
Cost, new	10,000	
Depreciation, 15 per cent.		
Value		8,500

2 hydraulic lifts.		
(Mayer, 1526)		
Value as per Mayer		
Cost, new	2,000	
Depreciation, 10 per cent.		
Value		1,800
5166 Cast iron charging floor.		
(Mayer, 1527)		
Value, as per Mayer	112.34	
Not included in this schedule, as it appears as part of building.		
Retort.		
(Mayer, 1526)		
10 benches of sixes as described.		
House standing not down.		
Cost, new	21,000	
Depreciation, 15 per cent.		
Value		18,000
2 Altman & Taylor boilers.		
(Mayer, 1528)		
Cost, new	5,000	
Depreciation, 5 per cent.		
Value		4,750
2 horizontal porcupine boilers.		
(Mayer, 1528)		
Cost, new	5,000	
Depreciation, 10 per cent.		
Value		4,500
1 No. 10 Sturtevant Blower.		
Value as per Mayer		$600
1 Armington & Sims Engine.		
Cost, new	1,200	
Depreciation, 10 per cent.		
Value		$1,080
1 No. 4 Garrison Pump.		
Value as per Mayer		$190
1 Berryman Heater (Mayer, 1529).		
Value as per Mayer		$195
Air and Salt Water Condenser (Mayer, 1529).		
Value as per Mayer		$10,290
1 Salt Water Condenser (Mayer, 1529).		
Value as per Mayer		$8,036

5167 Coal Hoisting Apparatus. (Mayer, 1529.)		
Value as per Mayer...............		$7,876

WATER TOWER CONTENTS:

(Mayer, 1530.)

1 Blake Pump.		
Value as per Mayer.................		$1,740
1 Worthington Pump, etc.		
Value as per Mayer...............		$423
1 Tank.		
Value as per Mayer...............		$1,200

EXHAUSTER AND BOILER HOUSE.

1 24-in. McKenzie Exhauster.		
Cost as per Mayer..................		$1,705
Value		$1,615
1 8 x 8 Greenfield Engine.		
Cost, new	$700	
Depreciation, 15 per cent.		
Value		$585
2 Vertical Boilers (Mayer, p. 1530).		
Value as per Mayer................		$399

LIME AND OXIDE SHED CONTENTS.

(Mayer, 1530.)

1 Knoll's Compressor.		
Value as per Mayer................		$2,750

PURIFIER SHED.

(Mayer, 1530.)

4 Cast Iron Purifier Boxes as Described.		
Cost, new	$13,000	
Depreciation, 10 per cent.		
Value		$11,700
5168 2 Hydraulic Carriages.		
Cost new	$2,000	
Depreciation, 10 per cent.		
Value		$1,800

METER HOUSE CONTENTS.

(Mayer, 1531.)

1 14-ft. Diameter Meter, Continental Iron Works.		
Cost new	$5,000	
Depreciation, 15 per cent.		
Value		$4,250
2 Sturtevant Blowers.		
Value as per Mayer		$360
3 Dismantled Beam Engines.		
Value as per Mayer		$863
Cost new as per Mayer	$1,150	
Depreciation, 90 per cent.		
Value		$115

STABLE CONTENTS.

(Mayer, 1531.)

23 Stalls.	
Value as per Mayer	$437

TOOL SHOP CONTENTS.

Value as per Mayer	$1,463

STORE HOUSE AND ANNEX CONTENTS.

(Mayer, 1531.)

Value as per Mayer	$420

OIL TANKS UNDER GROUND.

(Mayer, 1531.)

Value as per Mayer	$14,232

5169 OIL TANKS OVER GROUND.

(Mayer, 1532.)

Value as per Mayer	$846

FILTER PRESS HOUSE CONTENTS.

(Mayer, 1532.)

Value as per Mayer	$850
Tar and Oil System.	
Value as per Mayer	$1,662

PUMP SHED CONTENTS.

(Mayer, 1532.)

Value as per Mayer.................. $358

BLACKSMITH SHOP.

(Mayer, 1532.)

Value as per Mayer.................. $287

POWER HOUSE CONTENTS.

(Mayer, 1532.)

Worthington Pump.
Value as per Mayer................ $468

Cameron Pump.
Value as per Mayer................ $360

OIL TANKS CONSTRUCTED OF STEEL SET IN CIRCULAR PIT.

(Mayer, 1532.)

Value as per Mayer.................. $9,263

5170 CONCRETE MIXER HOUSE CONTENTS.

(Mayer, 1532.)

1 Sturtevant Blower.
Value as per Mayer................ $157

1 Concrete Mixer.
Value as per Mayer................ $380

3 Storage Tar Tanks.
(Mayer, p. 1533.)
Value as per Mayer................. $1,756

OIL PUMP HOUSE.

CONTENTS.

(Mayer, p. 1533.)

2 Steel Tanks.
Value as per Mayer................ $1,218

2 Davidson Pumps.
Value as per Mayer... .... $275

2 Cameron Pumps.
Value as per Mayer................ $314

1 Worthington Pump.
Value as per Mayer................ $197

1 Cameron Pump.
Value as per Mayer................ $314

1 Wothington Duplex.
Value as per Mayer................ $128

1 Cameron No. 9.
Value as per Mayer................ $325

Tar Separator System.
(Mayer, p. 1534.)
Value as per Mayer................ $2,250

1 10-ton Scale.
Value as per Mayer................ $300

Force Draft Plant.
Value as per Mayer................ $950

5171 RECAPITULATION.

Value of all apparatus and contents of plant as above. $357,485.00
Mr. Mayer (pp. 1368 and 1534) gives value of above as $409,175.00

CONSOLIDATED GAS COMPANY.

FORTY-FOURTH STREET STATION.

(Mayer, p. 1368.)

CONNECTIONS TO THE APPLIANCES IN THE PLANT.

Cast iron pipe—4 in. to 36 in. diameter, 9117 feet.
Cost, new ....
Depreciation,
Value ....

Steel riveted pipe—16 in. to 30 in. diameter, 600 feet.
Cost, new ....
Depreciation,
Value ....

Wrought iron pipe—1½ in. to 12 in. diameter, 8,702 feet.
Cost, new ....
Depreciation,
Value ....

Valves—68 ½ in., 37 2 in., 36 2½ in., 45 3 in., 58 4 in., 10 5 in., 34 6 in., 7 7 in., 18 8 in., 4 12 in., 9 16 in., 12 20 in., 77 24 in., 1 30 in.

RECAPITULATION.

Value of all the above yard connections and connections to appliances	$51,850.00
Mr. Mayer (p. 1369) gives a value for all of above connections of	99,910.00

5172 HOLDERS AND BRICK TANKS.

4 holders. 375,000 cu. ft. capacity each (Mayer, 1592 & 1369) Description as given.		
Cost	$75,000	
Depreciation, 10 per cent.		
Value		$67,500
1 holder. 2,000,000 cu. ft. capacity (Mayer, 1592 & 1369) Description as given.		
Cost	84,000	
Depreciation, 10 per cent.		
Value		75,600
2 holders. 125,000 cu. ft. capacity (Mayer, 1592 & 1369)		
Cost	25,250	
Depreciation, 10 per cent.		
Value		22,700
4 brick tanks for first four of above holders (Mayer, 1592 & 1369) Description as given.		
Cost	124,000	
Depreciation,		
Value		124,000
1 brick tank for 2,000,000 ft. capacity holder (Mayer, 1592 & 1357) Description as given.		
Cost	100,000	
Depreciation,		
Value		100,000

5173 2 brick tanks for 125,000 cu. ft. holders
(Mayer, 1592 & 1369)

Description as given.		
Cost	50,000.00	
Depreciation,		
Value		50,000

RECAPITULATION.

Value of all of the above holders and tanks	$439,800.00
Mayer (p. 1592 & 1369) gives a total cost of all holders, with their accompanying tanks, etc., as	814,929.00

5174 TWENTY-FIRST STREET PLANT.

Summary of Values, January, 1907.

Buildings	$646,708.00
Apparatus	913,284.00
Yard Connections	146,400.00
Holders & Tanks	470,100.00
	$2,176,492.00

BUILDINGS.

STOVE SHOP.

(Mayer, pp. 1370 and 1475.)

1-story building, 212 ft. 6 in. x 50 ft. x 20 ft.		
Cost, etc.	$27,000	
Depreciation, 20 per cent.		
Value		$21,600

METER SHOP.

(Mayer, pp. 1370 and 1475).

1-story brick building, 212 fe-t 6 in. x 50 ft. x 20 ft.		
Cost, etc.	$31,500	
Depreciation, 10 per cent.		
Value		$28,300

STOVE REPAIR SHOP.

(Mayer, pp. 1370 and 1476).

1-story and part 2-story building, dimensions as given.		
Cost, etc.	$15,500	
Depreciation, 20 per cent.		
Value		$12,000

STOVE CLEANING ROOM.

(Mayer, pp. 1370 and 1476).

51 ft. x 14 ft. x 20 ft.
Cost, etc. $750
Depreciation, 10 per cent.
Value $675

5175

DIAPHRAGM ROOM.

(Mayer, pp. 1370 and 1476).

Value included in Stove Repair Shop.

PREPAYMENT METER REPAIR SHOP.

(Mayer, pp. 1370 and 1476).

Costs, etc. $5,500
Depreciation, 15 per cent.
Value $4,750

STORAGE ROOM.

(Mayer, pp. 1370 and 1476).

20 ft. x 51 ft.
Cost, etc. $1,200
Depreciation, 15 per cent.
Value $1,000

WASH ROOM.

(Mayer, pp. 1370 and 1476).

12 ft. x 51 ft.
Cost, etc. $800
Depreciation, 10 per cent.
Value $720

BOILER HOUSE.

(Mayer, pp. 1370 & 1476).

Brick building, 40 ft. x 58 ft. x 20 ft.
Cost, etc. $7,900
Depreciation, 20 per cent.
Value $6,300

OIL STORAGE HOUSE.

(Mayer, pp. 1371 & 1476).

12 ft. x 14 ft. x 7 ft.
Cost, etc. $200
Depreciation, 5 per cent.
Value $190

5176 LEAD HOUSE.

(Mayer, pp. 1371 & 1476).

22 ft. x 17 ft. x 10 ft.

Cost, etc.	$460	
Depreciation, 5 per cent.		
Value		$440

FIRE HOSE HOUSE.

(Mayer, pp. 1376 & 1476).

5 ft. x 5 ft. x 6 ft.

Cost, etc.	$40	
Depreciation, 5 per cent.		
Value		$38

VALVE HOUSE.

(Mayer, pp. 1371 & 1476).

21 ft. 9 in. x 28 ft. x 11 ft.

Cost, etc.	$2,300	
Depreciation, 15 per cent.		
Value		$2,000

OCTAGONAL VALVE HOUSE.

(Mayer, pp. 1371 & 1476).

Brick building, 10 ft. 3 in. between parallel sides, 25 ft. high.

Cost, etc.	$2,600	
Depreciation, 10 per cent.		
Value		$2,350

ANOTHER VALVE HOUSE.

(Mayer, pp. 1371 & 1476).

Brick building, 15 ft. 6 in. x 10 ft. x 12 ft.

Cost, etc.	$640	
Depreciation, 10 per cent.		
Value		$575

5177 TIN SMITH SHOP.

(Mayer, pp. 1371 & 1477).

26 ft. x 28 ft. x 25 ft.

Cost, etc.	$2,900	
Depreciation, 15 per cent.		
Value		$2,500

STORE ROOM.

(Mayer, pp. 1371 & 1477).

Cost, etc.	$300	
Depreciation, 15 per cent.		
Value		$255

PAINT SHOP.

(Mayer, pp. 1371 & 1477).

Cost, etc.	$300	
Depreciation, 15 per cent.		
Value		$255

OFFICE BUILDING.

(Mayer, pp. 1371 & 1477).

47 ft. 4 in. x 51 ft. x 26 ft. 6 in. high.

Cost, etc.	$14,000	
Depreciation, 5 per cent.		
Value		$13,300

ENGINE ROOM, MACHINE SHOP & GANGWAY.

(Mayer, pp. 1371 & 1477).

150 ft. x 74 ft. x 46 ft. x 44 ft. x 25 ft. high.

Cost, etc.	$39,300	
Depreciation, 10 per cent.		
Value		$35,000

5178

OLD RETORT HOUSE.

(Mayer, pp. 1371 & 1477).

306 ft. x 54 ft. x 23 ft.

Cost, etc.	$35,000	
Depreciation, 15 per cent.		
Value		$30,000

FOUNDATIONS FOR BENCHES IN OLD RETORT HOUSE.

(Mayer, p. 1477.)

Value included in appraisal of Old Retort House.

NEW SHOP BUILDING.

(Mayer, pp. 1371 & 1477).

47 ft. x 57 ft. x 15 ft.

Cost, etc.	$5,000	
Depreciation, 3 per cent.		
Value		$4,850

OLD CARBURETTER HOUSE.

(Mayer, pp. 1371 & 1477).

38 ft. square.

Cost, etc.	$6,000	
Depreciation, 20 per cent.		
Value		$4,800

GENERATOR HOUSE.

(Mayer, pp. 1371 & 1477).

204 ft. x 50 ft. x 30 ft.

Cost, etc.	$63,500	
Depreciation, 15 per cent.		
Value		$54,000

5179 BUILDING OVER BOILER AND COKE STORAGE.

(Mayer, pp. 1371 & 1478.)

307 ft. 3 in. x 68 ft. x 25 ft. high.

Cost etc.	$40,000	
Depreciation, 15 per cent.		
Value		$34,000

GENERATOR HOUSE (22d Street).

(Mayer, pp. 1371 & 1478.)

204 ft. x 74 ft. x 30 ft.

Cost etc.	$65,500	
Depreciation, 15 per cent.		
Value		$55,000

RETORT HOUSE (22d Street).

(Mayer, pp. 1371 & 1478.)

307 ft. 3 in. x 74 ft. x 25 ft.

Cost, etc.	$42,000	
Depreciation, 15 per cent.		
Value		$36,000

PUMP HOUSE.

(Mayer, pp. 1371 & 1478.)

Two-story brick building, 20 ft. x 38 ft. x 29 ft. 4 in.

Cost, etc.	$4,500	
Depreciation, 10 per cent.		
Value		$4,000

NO. 1 SHED.

(Mayer, pp. 1371 & 1478.)

185 ft. 6 in. x 66 ft. x 28 ft. 6 in.

Cost, etc.	$30,000	
Depreciation, 50 per cent.		
Value		$15,000

5180

NO. 2 SHED.

(Mayer, pp. 1371 & 1478.)

Cost, etc.	$30,000	
Depreciation, 50 per cent.		
Value		$15,000

NO. 3 SHED.

(Mayer, pp. 1371 & 1478.)

Cost, etc.	$30,000	
Depreciation, 50 per cent.		
Value		$15,000

NO. 4 SHED.

(Mayer, pp. 1371 & 1478.)

Cost, etc.	$30,000	
Depreciation, 50 per cent.		
Value		$15,000

NO. 5 SHED.

(Mayer, pp. 1371 & 1478.)

Cost, etc.	$30,000	
Depreciation, 50 per cent.		
Value		$15,000

PURIFIER HOUSE.

(Mayer, pp. 1371 & 1478.)

185 ft. 6 in. x 66 ft. x 44 ft. high.

Cost, etc.	$38,000	
Depreciation, 20 per cent.		
Value		$30,000

CONDENSER AND SCRUBBER HOUSE.

(Mayer, pp. 1372 & 1478.)

185 ft. 6 in. x 66 ft. x 44 in. high.

Cost, etc.	$40,000	
Depreciation, 20 per cent.		
Value		$32,000

5181

PURIFIER HOUSE.

(Mayer, pp. 1372 & 1478.)

185 ft. 6 in. x 66 ft. x 44 ft. high.

Cost, etc.......................... $38,000
Depreciation, 25 per cent.
Value $30,000

METER HOUSE.

(Mayer, pp. 1372 & 1478.)

92 ft. x 72 ft. x 28 ft. high.

Cost, etc.......................... $17,000
Depreciation, 15 per cent.
Value $15,000

SHAVING SCRUBBER HOUSE.

(Mayer, pp. 1372 & 1478.)

185 ft. 6 in. x 66 ft. x 35 ft.

Cost, etc.......................... $22,000
Depreciation, 30 per cent.
Value $15,000

EXHAUSTER HOUSE.

(Mayer, pp. 1372 & 1478.)

Two-story brick, 64 ft. 4 in. x 49 ft. 10 in. x 41 ft. 3½ in. high.

Cost, etc.......................... $20,000
Depreciation, 10 per cent.
Value $18,000

COAL SHED.

(Mayer, pp. 1372 & 1479.)

150 ft. x 68 ft. x 34 ft. high.

Cost, etc.......................... $35,500
Depreciation, 25 per cent.
Value $26,000

5182

WATER TOWER.

(Mayer, pp. 1372 & 1479.)

Circular brick building, 20 ft. diameter, 25 ft. high.

Cost, etc.......................... $4,500
Depreciation, 50 per cent.
Value $2,250

Excavating, curbing and leveling for 12 Oil Tanks.

(Mayer, pp. 1372 & 1479.)

Value as per Mayer's appraisal......	$8,118

Excavation for 10 Separating Tanks.

(Mayer, pp. 1372 & 1479.)

Value as per Mayer's appraisal......	$8,462

One foundation for additional Oil Tank.

(Mayer, pp. 1372 & 1479.)

Value as per Mayer's appraisal......	5,000

One foundation for Steel Tank.

(Mayer, pp. 1372 & 1479.)

Value as per Mayer's appraisal......	980

TWENTY-FIRST STREET STATION.

RECAPITULATION.

Value of all buildings with new material complete, including foundations for buildings and all apparatus.......	$621,708	
Add for sewers, drainage, flagging grass plots and other miscellaneous improvements, including surfacing, etc.	25,000	
Value of all the above................		$646,708
Value given by Mr. Mayer for above, page 1372.....................		$1,579,695

5183

CONSOLIDATED GAS COMPANY.

TWENTY-FIRST STREET STATION.

APPARATUS.

(Mayer, pp. 1372, 1485.)

Value of engines and all apparatus as described (pp. 1485, 1486) down to contents of boiler houses.		
Cost, as per Mayer.................	$31,900.00	
Depreciation, 15 per cent.		
Value		$27,000.00

WATER HOUSE.

Contents.

(Mayer, p. 1487.)

2 60 h. p. boilers.		
Cost, as per Mayer	2,710.00	
Depreciation, 20 per cent.		
Value		2,200.00
1 3 in. Worthington water meter.		
Value, as per Mayer		50.00
2 steel stacks.		
Value, as per Mayer		96.00
Fire brick blocks.		
Value, as per Mayer		780.00

OIL STORAGE HOUSE.

Contents.

(Mayer, p. 1487.)

Value, as per Mayer	50.00

LEAD HOUSE.

Contents.

(Mayer, p. 1487.)

Value, as per Mayer	$250.00

5184

FIRE HOUSE.

Contents.

(Mayer, p. 1488.)

Value, as per Mayer	250.00

VALVE HOUSE.

Contents.

(Mayer, p. 1488.)

Photometer closet, etc.	
Value, as per Mayer	650.00
Pressure gauges.	
Value, as per Mayer	10.00
Bristol Recording Gauge.	
Value, as per Mayer	35.00
Electrical pressure indicator.	
Value, as per Mayer	250.00

OCTAGONAL VALVE HOUSE.

(Mayer, p. 1488.)

Value, as per Mayer..................		400.00

TIN SMITH SHOP.

Contents.

(Mayer, p. 1488.)

CONSOLIDATED GAS COMPANY.

99TH STREET STATION.

BUILDINGS.

ENGINE HOUSE, BOILER HOUSE, PUMP HOUSE, MACHINE SHOP, RETORT & ACCUMULATOR.

(Mayer, pp. 1374 & 1535).

5 houses under one roof, 273 ft. 3 in. x 57 ft. 5 in. x 28 ft. brick building.		
Cost, etc.	$77,000	
Depreciation, 10 per cent.		
Value		$70,000

GENERATOR HOUSE.

(Mayer, pp. 1375 & 1535).

2 story brick building, 69 ft. x 67 ft. 4 in. x 24 ft. 6 in.		
Cost, etc.	$28,000	
Depreciation, 10 per cent.		
Value		$25,000

FOUNDATIONS FOR ONE AIR CONDENSER.

(Mayer, pp. 1375 & 1535).

Value, as per Mayer's appraisal	$900

FOUNDATIONS FOR SALT WATER CONDENSER.

(Mayer, pp. 1375 & 1535).

Value, as per Mayer's appraisal	$368

5200

OFFICE BUILDING.

(Mayer, 1375, 1535).

2 story brick, 42 ft. x 30 ft. 8 in. x 30 ft. 6 in.		
Cost to build complete, new materials.	$7,500	
Depreciation, by reason of physical deterioration, 15 per cent.		
Value		6,500

METER HOUSE.

(Mayer, 1375, 1535).

1 story brick, 52 ft. x 39 ft. x 27 ft.		
Cost to build complete, new materials.	$8,700	
Depreciation, by reason of physical deterioration, 10 per cent.		
Value		$8,000

PURIFIER HOUSE.

(Mayer, 1375, 1535).

1 story brick, 124 ft. x 61 ft. 6 in. x 30 ft.		
Cost to build complete, new materials.	$20,000	
Depreciation, by reason of physical deterioration, 10 per cent.		
Value		$18,000

LIME HOUSE.

(Mayer, 1375, 1535).

1 story brick, 75 ft. x 15 ft. 9 in. x 18 ft.		
Cost to build complete, new material..	$3,400	
Depreciation, by reason of physical deterioration, 15 per cent.		
Value		$2,900

5201

VALVE HOUSE.

(Mayer, 1375, 1535).

10 ft. x 12 ft. x 10 ft.		
Cost to build complete, new materials.	$80	
Depreciation, by reason of physical deterioration, 10 per cent.		
Value		$72

FOUR VALVE HOUSES.

(Mayer, 1375, 1535).

Octagonal frame buildings, 8 ft. between parallel sides.		
Cost to build complete, new materials, $150 each	$600	
Depreciation, by reason of physical deterioration, 10 per cent.		
Value		$540

CONDENSER AND SCRUBBER.

(Mayer, 1375, 1535).

1 story brick, 52 ft. x 39 ft. x 27 ft.		
Cost to build complete, new materials.	$8,900	
Depreciation, by reason of physical deterioration, 10 per cent.		
Value		$8,000

EXHAUSTER HOUSE.

(Mayer, 1375, 1536).

1 story brick, 42 ft. 8 in. x 27 ft. x 25 ft.		
Cost to build complete, new materials.	$6,000	
Depreciation, by reason of physical deterioration, 10 per cent.		
Value		$5,400

5202

TAR SEPARATOR SYSTEM.

(Mayer, 1375, 1536).

Cost to build complete, new materials.	$1,350	
Depreciation, by reason of physical deterioration, 5 per cent.		
Value		$1,280

PUMP PIT.

(Mayer, 1375, 1536).

23 ft. x 13 ft. 8 in. x 10 ft. deep.

Cost to build complete, new materials.	$600	
Depreciation, by reason of physical deterioration, 5 per cent.		
Value		$570

TAR STORAGE.

(Mayer, 1536).

Value, as per Mayer..................	$128

COAL SHED.

(Mayer, 1375, 1536).

1 story brick, 125 ft. x 46 ft. x 18 ft.

Cost to build complete, new materials.	$10,000	
Depreciation, by reason of physical deterioration, 15 per cent.		
Value		$8,500

FILTER PRESS HOUSE.

(Mayer, 1375, 1536).

1 story frame, 13 ft. x 20 ft. x 7 ft.

Cost to build complete, new materials.	$250	
Depreciation, by reason of physical deterioration, 10 per cent.		
Value		$225

5203

WALLS AROUND WORKS.

(Mayer, 1375, 1536).

Brick walls, 663 ft. of wall, average height 10 ft. 12 in. thick.

Cost to build complete, new materials.	$5,000	
Depreciation, by reason of physical deterioration, 10 per cent.		
Value		$4,500

TIMBER FENCING.

(Mayer, 1536).

Dressed lumber, [illegible] ft. high.

Cost to build complete, new material..	$800	
Depreciation, by reason of physical deterioration, 10 per cent.		
Value		$720

COVER FOR DOORS OF OIL TANK.

(Mayer, 1375, 1536).

Cost to build complete, new materials.	$400	
Depreciation, by reason of physical deterioration, 10 per cent.		
Value		$360

FRAME BUILDING.

(Mayer, 1376)

7 ft. 6 in. x 125 ft. x 6 ft.
Foundations under hot scrubbers.
(Mayer, 1376, 1536)

Value, as per Mayer's Appraisal......	$498

5204 NINETY-NINTH STREET STATION.

RECAPITULATION.

Value of all buildings complete, including all foundations for buildings and apparatus	$162,461	
Add for drainage, flagging, grading, paving, surfacing, lawns and other miscellaneous improvements	25,000	
Value		$187,461
Mr. Mayer's appraisal of all of above (p. 1376)		248,247

APPARATUS.

GENERATOR HOUSE.

(Mayer, 1538.)

Four sets of 10-ft. U. G. I. low water gas apparatus with 24-in. take-off mains, each set consisting of 10-ft. diameter by *by* 14-ft. high generator with 3 19½-in. diameter coaling towers.

One 10-ft. diameter by 11-ft. high carbureter with necessary water and oil connection.

One 10-ft. diameter by 22-ft. high superheater with necessary stacks, 36-in diameter by 20-ft. high over all. One 8 ft. 6 in. diameter by 4 ft. hot wash box.

These sets have necessary hot gas valves with air jackets, also necessary generators, carbureters and superheaters, interlocking gears. Also motors, gear apparatus, coal guards, etc.

Cost new	$45,200	
Depreciation, 10 per cent.		
Value		$40,500

The Water Gas Apparatus (Mayer, 1539) is valued at $56,000 and $8,167 for the charging floor. The apparatus was installed in 1904 and price was obtained from the U. G. I. Imp. Co.

5205 OUTSIDE GENERATOR HOUSE.

(Mayer, 1539.)

Air condenser.

Value, as per Mayer...............	$7,615

Salt Water Condenser.

(Mayer, 1540.)

Value, as per Mayer...............	$9,845

OFFICE FURNITURE.

Cost, as per Mayer..................	$2,000	
Depreciation, 20 per cent.		
Value		$1,600

METER HOUSE.

(Mayer, 1540.)

1 13 x 6 station meter.

Cost new........................	$7,900	
Depreciation, 15 per cent.		
Value		$6,700

1 13x6 station meter.

Cost new........................	$5,700	
Depreciation, 15 per cent.		
Value		$4,900

PURIFIER HOUSE.

(Mayer, 1514.)

Two sets of 4 purifiers 21 x 20 ft. x 3 ft. deep. Three layers of trays for each box. Size of connections 24 in. Two center seals, diameter 6 ft. and 5 ft. deep. Two hydraulic lifts for purifier covers constructed of steel. Size 15 ft.

Cost new........................	$25,000	
Depreciation, 5 per cent.		
Value		$24,000

LIME HOUSE.

(Mayer, 1541.)

Value, as per Mayer..................	$100

5206 VALVE HOUSE CONTENTS.

(Mayer, 1541.)

Value, as per Mayer...............	$30
Another valve house.	
Value, as per Mayer...............	$30
Grip house.	
Value, as per Mayer...............	$30
Another grip house.	
Value, as per Mayer...............	$30
Another valve house.	
Value, as per Mayer...............	$30
Another valve house.	
Value, as per Mayer...............	$30
Another valve house.	
Value, as per Mayer...............	$10
Another valve house.	
Value, as per Mayer...............	$10
Another grip house.	
(Mayer, 1541.)	
Value, as per Mayer...............	$4,420
Cast iron condenser.	
Value, as per Mayer...............	$15,680

EXHAUSTER HOUSE CONTENTS.

(Mayer, 1542.)

1 Exhauster.		
Value, as per Mayer...............		$1,865
Greenfield engine.		
Cost new........................	$825	
Depreciation,		
Value		$685

5207 TAR SEPARATING SYSTEM IN YARD.

(Mayer, 1542.)

Value, as per Mayer..................	$2,250

PUMP PIT.

(Mayer, 1542.)

2 Knoll pumps.		
Value, as per Mayer...............		$265
1 Davidson pump.		
Value, as per Mayer...............		$215
1 Cameron pump.		
Value, as per Mayer...............		$145
Tar Storage.		
Value, as per Mayer..............		$675
12 Steel tanks.		
(Mayer, 1542.)		
Value, as per Mayer...............		$13,837
2 Oil storage tanks.		
(Mayer, 1543.)		
Value, as per Mayer...............		$3,271
Another steel tank.		
(Mayer, 1543.)		
1 Crib valve tank.		
Value, as per Mayer...............		$602
2 Hydraulic lifts.		
Value, as per Mayer...............		$4,200
2 Platform scales.		
Value, as per Mayer...............		$300

YARD CONTENTS.

(Mayer, p. 1543.)

2 Hot scrubbers.		
Value, as per Mayer...............		$1,625
5208 2 Hydrogen scrubbers.		
Cost as per Mayer..................	$1,560	
Depreciation,		
Value.		

ENGINE HOUSE.

(Mayer, 1546.)

2 Sturtevant engines.		
Cost new.........................	$1,200	
Depreciation, 15 per cent.		
Value		$1,020

1 Armington & Simms horizontal engine.		
Cost new in place	$1,200	
NOTE—All values for engines and apparatus are in place.		
Depreciation, 15 per cent.		
Value		$1,040
3 B. F. Sturtevant gas blowers.		
Value, as per Mayer		$350
2 McKenzie Exhausters.		
Value, as per Mayer		$3,726
2 Greenfield vertical engines.		
Cost new	$2,000	
Depreciation, 15 per cent.		
Value		$1,700
2 Knoll pumps.		
Value, as per Mayer		$210

BOILER HOUSE CONTENTS.

2 Batteries B. & W. type boilers, etc.		
Cost new, including stack and breaching	$14,000	
Depreciation, 5 per cent.		
Value		$13,300
1 Sturtevant blower.		
(Mayer, 1549.)		
Value, as per Mayer		$1,250
5209 1 Gould & Garrison pump.		
Value, as per Mayer		$175
1 Patterson & B. feed water meter.		
Value, as per Mayer		$265

CARBURETER HOUSE CONTENTS.

(Mayer, 1547.)

(Used as pump house and machine shop.)

Value, as per Mayer	$3,510

PUMP HOUSE CONTENTS.

(Mayer, 1548.)

Value, as per Mayer	$820

RETORT HOUSE.

(Mayer, 1549.)

11 through benches of sixes, back to back.
Cost new.........................
Depreciation,
Value ....

CUMULATOR HOUSE.

(Mayer, 153.)

Value, as per Mayer............... $960

1 Steel water tank.
(Mayer, 1553.)
Value, as per Mayer............... $347

1 Davidson pump.
(Mayer, 1553.)
Value, as per Mayer............... $370

Wooden tank.
Value, as per Mayer............... $375

Filter Press House.
(Mayer, 1553.)
Value, as per Mayer............... $1,700

Howe scales.
Value, as per Mayer............... $300

5210 Miscellaneous tanks.
(Mayer, 1553-1554.)
Value, as per Mayer............... $1,154

RECAPITULATION.

Value of all above apparatus, contents of plant........ $178,067.00
Mr. Mayer (pp. 1376-1554) gives the value of all above apparatus as.................................. $268,177.00

CONNECTIONS TO THE APPLIANCES IN THE PLANT.

(Mayer, p. 1376.)

Cast iron pipes.
4 in. to 36 in. diameter, 5,861 feet.
Cost new.......................
Depreciation,
Value ....

Steel riveted pipes.
30 in. diameter, 339 feet.
Cost new........................
Depreciation,
Value ....

Wrought iron pipes.
1½ in. to 10 in. diameter, 5,552 feet.
Cost new........................
Depreciation,
Value ....

Valves.
4 3-in., 4 4-in., 24 3-in., 25 4-in., 13 6-in., 10 8-in., 10 10-in., 2 12-in., 18 16-in., 18 20-in., 30 24-in., 1 30-in.
Cost new........................
Depreciation,
Value ....

RECAPITULATION.

Value of all the above yard connections and connections to appliances................................	33,550.00
Mr. Mayer (p. 1377) gives a value for all of above connections of................................	55,248.00

5211 HOLDERS IN BRICK TANKS.

(Mayer, 1377 & 1593).

2 holders, 600,000 cu. ft. capacity, description as given.		
Cost	$54,600	
Depreciation, 15 per cent.		
Value		$46,400
1 holder, 300,000 cu. ft. capacity, description as given.		
Cost	16,300	
Depreciation, 15 per cent.		
Value		13,850
1 holder, 100,000 cu. ft. capacity, description as given.		
Cost	7,350	
Depreciation, 20 per cent.		
Value		5,880
Brick tanks for above:		
2 brick tanks for 600,000 cu. ft. capacity holders.		
Cost	33,000	
Depreciation,		
Value		33,000

Brick tank for 300,000 cu. ft. holder.		
Cost	27,000	
Depreciation,		
Value		27,000
Brick tank for 100,000 cu. ft. holder.		
Cost	19,500	
Depreciation,		
Value		19,500

RECAPITULATION.

Value of all of the above tanks and holders	$145,630
Mr. Mayer (p. 1593 and 1377) gives value for all these holders and tanks as	262,106

5212 EIGHTEENTH STREET PLANT.

SUMMARY OF VALUES, JANUARY, 1907.

Buildings	$77,781.00
Apparatus	6,505.00
Yard connections	2,800.00
Holders & tanks	147,800.00
	$234,886.00

EIGHTEENTH STREET.

FIVE FRAME SHEDS.

(Mayer, p. 1378, 1556).

Cost to build, complete, new materials	$80	
Depreciation, by reason of physical deterioration, 10 per cent.		
Value		$72

ENGINE AND EXHAUSTER HOUSE.

(Mayer, 1378, 1556).

1 story brick, 36 ft. 6 in. x 19 ft. x 15 ft. 6 in., all 30 ft. high.		
Cost to build complete, new materials.	$4,850	
Depreciation, by reason of physical deterioration, 5 per cent.		
Value		$4,600

VALVE HOUSE.

(Mayer, 1378—1556).

1 story brick, 19 ft. x 22 ft. x 20 ft.		
Cost to build complete, new materials..	$1,185	
Depreciation, by reason of physical deterioration, 5 per cent.		
Value		$1,125

5213

BOILER HOUSE.

(Mayer, 1378, 1556).

1 story brick, 46 ft. 2½ in. x 14 ft. x 14 ft. 3 in.		
Cost to build complete, new materials.	$1,875	
Depreciation, by reason of physical deterioration, 10 per cent.		
Value		$1,690

WAGON SHED & PAINT SHOP.

(Mayer, 1556).

Cost to build complete, new materials..	575	
Depreciation, by reason of physical deterioration, 10 per cent.		
Value		$520

WAGON SHED.

(Mayer, 1378-1556).

21 ft. x 28 ft. x 15 ft.		
Cost to build complete, new materials.	$650	
Depreciation, by reason of physical deterioration, 10 per cent.		
Value		$585

BRICK AND BROWNSTONE BUILDING CONTAINING GAS HOLDERS.

(Mayer, 1378-1556).

Cost to build complete, new materials...	$72,000	
Depreciation, by reason of physical deterioration, 25 per cent.		
Value		$54,000

COAL STORAGE YARD BETWEEN 18TH AND 19TH STREETS.

(Mayer, 1378-1558).

520 ft., about 9 ft. high.

Cost to build complete, new materials.	$950	
Depreciation, by reason of physical deterioration, 50 per cent.		
Value		$475

5214 COAL STORAGE YARD BETWEEN 17TH AND 18TH STREETS.

(Mayer, 1378-1558).

720 ft., about 9 ft. high.

Cost to build complete, new materials.	$1,800	
Depreciation, due to physical deterioration, 50 per cent.		
Value		$900

BRICK WALLS IN YARD BETWEEN 17TH AND 18TH STREETS.

(Mayer, 1378-1558).

12 in. thick, 180 ft. long.

Cost to build complete, new materials.	$1,150	
Depreciation, due to physical deterioration, 20 per cent.		
Value		$920

1 timber coal holding trestle.

(Mayer, 1378-1558)

Value, as per Mayer's appraisal.....	$3,744

600 ft. of brick retaining wall.

(Mayer, 1378-1558)

Wall, 12 in. thick, about 9 ft. above grade.

Cost to build complete, new materials.	$5,200	
Depreciation, by reason of physical deterioration, 20 per cent.		
Value		4,150

RECAPITULATION.

Value of all buildings complete, including foundations for buildings and apparatus	$72,781	
Add for grading, sewers, piping, flagging and other miscellaneous improvements	5,000	
Value of all of above................		$77,781
Value as given by Mr. Mayer (p. 1379, 1558) (probably including holders).		182,901

5215 CONSOLIDATED GAS COMPANY.
18TH STREET STATION.

APPARATUS.

FRAME BUILDING IN HOLDER YARD CONTENTS.

(Mayer, 1558).

2 vertical boilers.
Value, nothing.

ENGINE HOUSE AND VALVE HOUSE CONTENTS.

(Mayer, 1558).

1 McKenzie exhauster. Value, as per Mayer..............	$1,505
1 Greenfield engine. Valve, as per Mayer...............	418
Counter-shafting, etc. Value, as per Mayer...............	80
3 King pressure gauges. Value, as per Mayer...............	105
1 Arch gauge, etc., etc. Value, as per Mayer...............	130

BUILDING CONTAINING PRESSURE GAUGES CONTENTS.

(Mayer, 1559).

Value, as per Mayer.................	167

BOILER HOUSE CONTENTS.

(Mayer, 1559).

1 horizontal tubular boiler. Value, per Mayer	$1,815

Pressure gauges.		
Value, as per Mayer..............		25
Locker.		
Value, as per Mayer.................		50

STABLE CONTENTS.

(Mayer, 1559).

Stalls.		
Value		$250
Locker.		
Value, as per Mayer................		60

5216 COAL STORAGE YARD.

(Mayer, 1559).

Trestle work, etc.		
Cost, new	$9,500	
Depreciation, 80 per cent.		
Value		$1,900

RECAPITULATION.

Value of all apparatus and contents of yard as given above...............	$6,505
Mr. Mayer (pp. 1379 and 1560) gives the value of above as............	14,019

CONNECTIONS TO THE APPLIANCES IN THE PLANT.

(Mayer, p. 1379.)

Cast iron pipes, 20 in. in diameter, 1,809 ft.

Cost, new ....
Depreciation.
Value ....

Wrought iron connections, 1 in. to 3 in. in diameter, 360 ft.

Cost, new ....
Depreciation.
Value ....

Valves, eight, 1-in.; three; 2-in.; four, 16-in.; twenty-six, 24-in.

RECAPITULATION.

Value of all of the above yard connections and connections to appliances	$2,800.00
Mr. Mayer (p. 1379) gives the value of above connections as	21,987.00

5217 HOLDERS IN BRICK TANKS.

(Mayer, p. 1379)

2 holders, each of 205,000 cu. ft. capacity, description as given.		
Cost	$21,320	
Depreciation, 50 per cent.		
Value		$10,700
4 holders of 255,000 cu. ft. capacity, description as given.		
Cost	53,000	
Depreciation, 30 per cent.		
Value		37,100
Brick tanks and foundations for above holders:		
2 brick tanks for the first mentioned holders of 205,000 cu. ft. capacity Cost of these tanks is included in value of building which surrounds them.		
4 brick tanks for the 4 255,000 cu. ft. capacity holders, description as given.		
Cost	103,000	
Depreciation, 3 per cent.		
Value		$100,000

RECAPITULATION.

Value of all of the above tanks and holders	$147,800
Mr. Mayer (p. 1379) gives the value for above holders and tanks as........	$209,743.00

5218 SIXTY-THIRD STREET PLANT.

SUMMARY OF VALUES, JANUARY, 1907.

Buildings	$8,540.00
Apparatus	379,600.00
Yard connections	2,800.00
Holders and tanks..................	232,800.00

SIXTY-FIFTH STREET STATION.

RECAPITULATION.

Value of all buildings complete, including foundations for buildings and apparatus	$40,150	
5223 Add for grading, sewers, piping, flagging and other miscellaneous improvements	2,500	
Value of all of above...............		$42,650
Value of above, as per Mayer's appraisal		51,183

CONSOLIDATED GAS COMPANY.

SIXTY-FIFTH STREET STATION.

APPARATUS.

ENGINE AND VALVE HOUSE CONTENTS.

(Mayer, pp. 1385 and 1572)

1 beam engine.		
Cost, erected	$300.00	
Depreciation, 15 per cent.		
Value		255.00

EXHAUSTER HOUSE.

(Mayer, pp. 1573 and 1385)

1 Rowland engine, etc.		
Cost, new	$1,320.00	
Depreciation, 15 per cent.		
Value		$1,118.00
1 Mackenzie exhauster.		
Value as per Mayer................	1,738.00	

1 Photometer, furniture and plumbing.		
Value as per Mayer		1,000.00
Brick tanks for above holders.		
6 brick tanks for holders of 325,000 cub. ft. capacity, description as given.		
Cost	147,000	
Depreciation,		
Value		147,000
2 brick tanks for 24,000,000 cub. ft. holders, description as given.		
Cost	320,000	
Depreciation,		
Value		320,000

5224 BOILER HOUSE.

(Mayer, pp. 1574 and 1385.)

2 horizontal tubular boilers.		
1 horizontal tubular boiler.		
Value for the 3, new and set up	$2,325.00	
Depreciation, 5 per cent.		
Value		$2,200.00
1 feed pump.		
Value as per Mayer		57.00
1 injector.		
Value as per Mayer		38.00
1 steel stack.		
Value as per Mayer		171.00

BOILER HOUSE EXTENSION.

CONTENTS.

(Mayer, pp. 1574 and 1385.)

1 horizontal tubular boiler.		
Cost, new	$1,400.00	
Depreciation, 5 per cent.		
Value		$1,325.00
1 injector.		
Value as per Mayer		42.00

APPARATUS.

RECAPITULATION.

Value of all above apparatus	$6,206.00
Mr. Mayer (pp. 1574 and 1585) gives as value for the above apparatus	10,159.00

CONNECTIONS TO THE APPLIANCES IN THE PLANT.

(Mayer, p. 1385.)

Cast iron pipe, 16 in. to 30 in. diameter, 750 feet.

Cost, new ....
Depreciation,
Value ....

5225 24 in. pipe, 260 feet.

Cost, new ....
Depreciation,
Value ....

Wrought iron pipe, 500 ft., 2 in. and less in diameter.

Cost, new ....
Depreciation ....
Value ....

Valves, 23-30 in., 4-16 in.

RECAPITULATION.

Value of all of the above yard connections and connections to appliances	$8,415
Mr. Mayer (p. 1385) gives as value for above connections	20,406

HOLDERS IN BRICK TANKS.

HOLDERS IN CONCRETE FRAMES.

(Mayer, 1386 and 1575.)

2 holders, 325,000 cub. ft. capacity.		
Description as given:		
Cost	$32,800	
Depreciation, 10 per cent.		
Value		$29,500
4 holders, same size as above, description as given.		
Cost	65,600	
Depreciation, 10 per cent.		
Value		59,100
2 holders, 4,000,000 cub. ft. capacity, description as given.		
Cost	294,000	
Depreciation, 5 per cent.		
Value		279,300

5226

RECAPITULATION.

Value of all of the above tanks and holders............	$834,900
Mayer (1577 and 1386) gives value for all holders and tanks of	1,212,873

ONE HUNDRED AND ELEVENTH STREET PLANT.

Summary of Values, January, 1907.

Buildings	$64,085.00
Apparatus	42,421.00
Yard connections	16,800.00
Holders and tanks..........................	777,100.00
Total	$900,406.00

BUILDINGS.

Office Building.

(Mayer, 1356-1578.)

2 story brick, 50 ft. x 25 ft. x 31 ft. 6 in.		
Cost to build complete, new materials.	$5,240	
Depreciation, due to physical deterioration, 15 per cent.		
Value		$4,500

EXHAUSTER HOUSE.

(Mayer, 1386-1578.)

1 story brick, 66 ft. x 54 ft. x 27 ft. 4 in.		
Cost to build complete, new materials.	$19,600	
Depreciation, due to physical deterioration, 20 per cent.		
Value		$15,000

BOILER HOUSE.

(Mayer, 1386-1578.)

44 ft. 3 in. by 32 ft. 3 in. x 18 ft.		
Cost to build complete, new materials.	$3,000	
Depreciation, due to physical deterioration, 15 per cent.		
Value		$2,500

5227

HOISTING HOUSE ENGINE.

(Mayer, 1386-1578.)

Frame shed, 13 ft. x 18 ft. x 7 ft.		
Cost to build complete, new materials.	$160	
Depreciation, due to physical deterioration, 10 per cent.		
Value		$140

SCALE HOUSE.

(Mayer, 1386-1578.)

12 ft. x 15 ft. x 13 ft.		
Cost to build complete, new materials.	$375	
Depreciation, by reason of physical deterioration, 10 per cent.		
Value		$335

STABLE.

(Mayer, 1387-1578.)

Brick building with basement, 75 ft. x 32 ft. x 25 ft.		
Cost to build complete, new materials.	$7,800	
Depreciation, by reason of physical deterioration, 10 per cent.		
Value		$7,000

COAL STORAGE.

(Mayer, 1387-1578.)

Area 67 ft. x 52 ft.		
Cost to build complete, new materials.	$330	
Depreciation, by reason of physical deterioration, 10 per cent.		
Value		$300

GENERATOR HOUSE.

(Mayer, 1387-1578.)

1 story brick 72 ft. x 48 ft. x 27 ft.		
Cost to build complete, new materials.	$7,400	
Depreciation, by reason of physical deterioration, 50 per cent.		
Value		$3,700

5228

WOODEN TOOL SHOP.

(Mayer, 1387-1578.)

48 ft. 6 in. x 65 ft. 9 in.

Cost to build complete, new materials. $1,700

Depreciation, by reason of physical deterioration, 10 per cent.

Value $1,500

RETORT HOUSE.

(Mayer, 1387-1578.)

Brick, 200 ft. x 52 ft. x 22 ft.

Cost to build complete, new materials. $26,000

Depreciation, by reason of physical deterioration, 40 per cent.

Value $15,000

FOUNDATION FOR OIL TANK.

(Mayer, pp. 1387-1578.)

43 ft. diameter, 11 ft. high, of brick, 12 in. thick.

Cost to build complete, new materials. $2,760

Depreciation, by reason of physical deterioration, 10 per cent.

Value $2,500

BLACKSMITH SHOP.

(Mayer, pp. 1387-1578.)

Brick, 26 ft. x 34 ft. x 19 ft.

Cost to build complete, new materials. $2,600

Depreciation due to physical deterioration, 20 per cent.

Value $2,000

FENCES, STABLE YARD.

(Mayer, pp. 1387-1578.)

270-ft. wooden fence 8 ft. high.

Cost to build complete, new materials. $350

Depreciation, by reason of physical deterioration, 20 per cent.

Value $280

5229 FENCE ABOUT HOLDERS.

(Mayer, pp. 1387-1579.)

1140 ft., 8 ft. high.		
Cost to build complete, new materials,	$650	
Depreciation by reason of physical deterioration, 20 per cent.		
Value		$525

FENCE AROUND WORKS.

(Mayer, pp. 1387-1579.)

1000 ft., 8 ft. high.		
Cost to build complete, new materials,	$1,200	
Depreciation by reason of physical deterioration, 20 per cent.		
Value		$980

BRICK WALL ON FIRST AVENUE.

(Mayer, pp. 1387-1579.)

56 ft. x 8 ft. high.		
Cost to build complete, new materials,	$400	
Depreciation due to physical deterioration, 20 per cent.		
Value		$325

ONE HUNDRED AND ELEVENTH STREET.

RECAPITULATION.

Value of all buildings complete, including foundations for buildings and apparatus	$56,585	
Add for grading, sewers, piping, flagging and other miscellaneous improvements	7,500	
Value of all of above................		$64,085
Value of above per Mayer's appraisal (pp. 1387-1579).		$107,981

5230 CONSOLIDATED GAS COMPANY.

111th Street Station.

APPARATUS.

OFFICE BUILDING—CONTENTS.

(Mayer, pp. 1574 and 1387.)

Office furniture, etc.		
Value as per Mayer		$2,125

EXHAUSTER HOUSE.

(Mayer, pp. 1574 and 1387.)

42 valve stands.		
Value as per Mayer		$636
2 exhausters.		
Value as per Mayer		5,870
2 Payne reversible engines.		
Cost, new, set up	$4,000	
Depreciation, 15 per cent.		
Value		3,600
2 Connelly governors.		
Value as per Mayer		4,500
1 copper and feed water heater.

YARD.

CONTENTS.

(Mayer, pp. 1581 and 1388.)

Oil tank.	
Value as per Mayer	$1,652.00
Atmospheric condenser.	
Value as per Mayer	4,444.00

RECAPITULATION.

Value of the above apparatus and contents of plant	$42,421.00
Mr. Mayer (pp. 1389 & 1582) gives value of all of above apparatus (p. 1582) as	$74,914.00
and on page 1389	$103,446.00

The lower figure is obviously the correct one.

CONNECTIONS TO THE APPLIANCES IN THE PLANT.

(Mayer, p. 1389.)

Cast iron pipe, 24 in. to 36 in., 550 feet.

Cost, new ....
Depreciation,
Value ....

Wrought iron pipe, 1½ in. to 4 in., 760 feet.

Cost, new ....
Depreciation,
Value ....

Valves, 41 36 in., diameter 1 24 in.

(Mayer, p. 1369.)

RECAPITULATION.

Value of all of the above yard connections, and connections to appliances.	$16,800.00
Mr. Mayer gives value of all such connections as	27,068.00

5233 TWO HOLDERS, WITH ACCOMPANYING TANKS.

Two Holders in Steel Tanks (Each of five million cubic feet capacity.)

(Mayer, 1389.)

Description as given.		
Cost, etc.	$702,200	
Depreciation, 3 per cent.		
Value		$681,100

FOUNDATION FOR ABOVE.

Description as given.		
Cost, etc., for 2 holders	$96,000	
Depreciation,		
Value		$96,000

RECAPITULATION.

Value of above holders, and foundations for same	$777,100
Mr. Mayer (p. 1389) gives the value of above holders and foundations	$704,737

ONE HUNDRED AND THIRTY-SECOND STREET PLANT.

Summary of Values, January, 1907.

Buildings	$24,540.00
Apparatus	14,514.00
Yard connections	25,170.00
Holders & Tanks	393,300.00
	$457,524.00

BUILDINGS.

1 Governor and 1 boiler house.

(Mayer, 1389-1585.)

Brick building, 100 ft. x 49 ft. x 29 ft.		
Cost to build complete, new materials.	$21,000	
No depreciation.		
Value		$21,000

5234

BOILER CHIMNEY.

(Mayer, 1390-1585.)

Value, as per Mayer	$3,040

RECAPITULATION.

Value of all buildings, including foundations for buildings and apparatus.	$24,040	
Add for grading, sewers, piping, flagging and other miscellaneous improvements	500	
Value of all of above		$24,540
Value of above per Mayer's appraisal (p-. 1390-1585)		29,776

APPARATUS.

GOVERNOR AND BOILER HOUSE.

CONTENTS.

(Mayer, p-. 1585 & 1390.)

1 vertical exhauster		
Value as per Mayer		$2,910.00
1 Buckeye engine		
Cost new and erected	$2,000.00	
Depreciation, 15 per cent.		
Value		1,700.00
1 in. Connolly governor		
Value as per Mayer		1,375.00
3 B. & W. boilers and 2 batteries		
Cost to build, new	5,100.00	
Depreciation, 5 per cent.		
Value		4,845.00
1 Knowles pump		
Value as per Mayer		143.00
1 Cochran feed water heater.		
Value as per Mayer		505.00
1 steel plate breeching		
Value as per Mayer		750.00
1 Crown water meter (Mayer, p. 1586)		
Value as per Mayer		$165.00
5235 1 injector		
Value as per Mayer		78.00

1 blow-off tank	
Value as per Mayer...............	73.00
1 exhauster head, etc.	
Value as per Mayer...............	1,885.00
Toilet & wash basins	
Value as per Mayer...............	85.00

RECAPITULATION.

Value of all of above apparatus and contents of plant..	$14,514.00
Mr. Mayer (at pages 1586 & 1390) gives the value of above apparatus as..........................	18,979.00

CONNECTIONS TO THE APPLIANCES IN THE PLANT.

(Mayer, p. 1390.)

Cast iron connections, 20 in. to 36 in. pipe, 2,400 feet.

Cost, new
Depreciation,
Value,

Value,

RECAPITULATION.

Value of all of the above yard connections and connections to appliances	$25,170.00
Mr. Mayer (p. 1391) gives for the above connections of.	47,714.00

HOLDERS WITH ACCOMPANYING TANKS.

1 Holder (of five million cubic feet capacity) In steel tank (Mayer, 1391) Description as given.		
Cost to build	$356,100	
Depreciation, 5 per cent.		
Value		$338,300
5236 Foundation for above:		
Cost, etc.	55,000	
Depreciation,		
Value..........................		55,000

RECAPITULATION.

Value of above holders with steel tank and foundation...	$393,300
Mayer, p. 1391, gave value of above holder, tank, and foundation as	393,965

INWOOD PLANT.

Summary of Values, January, 1907.

Buildings	$2,900.00
Apparatus	827.00
Yard connections	545.00
Holders & Tanks	7,500.00
	$11,772.00

INWOOD.

EXHAUSTER AND VALVE HOUSE AND DWELLING.

(Mayer, 1391-1589.)

1 story building, 22 ft. x 24 ft. x 11 ft. 4 in. and 24 ft. high.		
Cost to build complete, new materials.	$3,050.00	
Depreciation by reason of physical deterioration, 20 per cent.		
Value		$2,400

RECAPITULATION.

Value of all buildings, complete, including foundations for building and apparatus	$2,400	
Add for grading, sewers, piping, flagging and other miscellaneous improvements	500	
Value of all of above		$2,900
Value of above per Mayer's appraisal (pp. 1391-1590)		$3,230

5237 EXHAUSTER HOUSE.

CONTENTS.

(Mayer, p. 1590 & 1392.)

1 6 in. Mackenzie exhauster.		
Value		$250.00
1 Smith & Sayre vertical engine.		
Cost, new and erected	$220.00	
Depreciation, 15 per cent.		
Value		187.00

1 12 in. governor.		
Value		50.00
1 upright tubular boiler.		
Cost to build, new	200.00	
Depreciation, 5 per cent.		
Value		190.00
Steam pipe connections and fittings and pressure gauges.		
Value		100.00
1 Cameron pump.		
Value		50.00

RECAPITULATION.

Value of all of above apparatus and contents of plant	$827.00
Mr. Mayer (p. 1392 & 1590) gives the value of all of above apparatus and contents as	$1,640.00

CONNECTIONS TO THE APPLIANCES IN THE PLANT.

(Mayer, p. 1392.)

Cast iron pipe, 6 in. to 12 in, 170 feet.

Value,

RECAPITULATION.

Value of all of above yard connections and connections to appliances	$545.00
Mr. Mayer (p. 1392) gives value for the above connections as	923.00

CONSOLIDATED GAS COMPANY.

INWOOD STATION.

HOLDERS, WITH ACCOMPANYING TANKS.

Holders in brick tanks (1,060,000 cu. ft. capacity, Mayer, 1392).		
Description as given.		
Cost, new	$3,100	
Depreciation, 10 per cent.		
Value..........................		$2,800
Brick Tank and Foundation for Above.		
Description as given.		
Cost to build.....................	$5,200	
Depreciation, 10 per cent.		
Value..........................		$4,700

RECAPITULATION.

Value of above holder, with tank and foundation.....	$7,500.00
Mr. Mayer (p. 1392) gives value of above brick tank and foundation as	$17,984.00

5239 Q. Are you able from your knowledge and experience in the construction of gas plants to state what would be the fair and reasonable cost in the Borough of Manhattan of a coal gas plant per thousand cubic feet daily capacity?

Mr. Mathewson: I object to that on the ground that the witness has not been shown to be competent to make such an estimate in the Borough of Manhattan; and, certainly, I did not know that that was a subject that we were to go into to-day. I thought it was the valuation of these plants only that we were to take up.

Mr. Page: You see, we have got a whole day and a half still in which to examine Mr. Edgerton, if we care to, I suppose, and it is necessary for the further closing up of the estimate he gave as to the cost of production of gas by certain methods, and I wanted to show what it would cost to produce a plant that would make the gas that he testified to.

Mr. Mathewson: The principal objection is the witness is not competent and has not been shown competent to testify to that.

Mr. Page: And we have the testimony of Mr. Mayer upon that point.

Mr. Mathewson: No.

The Master: I think the second ground of objection is good, that this hearing was set down for a certain specified purpose; as I recall the direction of the Court, to put in some appraisals as to the values of these plants based on this witness's examination, and if I understand the direction of the Court right, his testimony is limited to this specific point. Now you have covered that.

5240 Mr. **Page**: Well, then, we will take an exception, and take the testimony under the rule.

The **Master**: All right.

Mr. **Mathewson**: Well, I will urge my objection that the witness has not been shown to be competent to give an estimate as to the cost of the construction of a plant on the Island of Manhattan, a coal gas plant to furnish the gas. He has had no experience here, concededly.

The **Master**: The disposition of that is academic. I sustained the other objections, and Page excepts, and we will have to take the answer of the witness.

Mr. **Page**: Now, you may read the question.

The **Stenographer** (reading): Are you able from your knowledge and experience in the construction of gas plants to state what would be a fair and reasonable cost in the Borough of Manhattan of a coal gas plant per thousand cubic feet daily capacity?

The **Master**: Of course, if you think this matter is of sufficient importance to justify taking the time and trouble in so doing, you are entitled, if you wish to prevent this going on, to decline to go on further and certify the record to the Court, if you think it is of enough importance to do so, and that would bring up the question as to whether the Senator has a right to have this set down on the record. Under the circumstances, it will take more time probably than the thing is worth.

Mr. **Mathewson**: I think my rights will be sufficiently protected by the exception, Mr. Master, without the delay that the other course would entail, and I leave it in that shape.

A. I think I can give it quite approximately to what the actual cost would be.

5241 Q. Will you state?

Mr. **Mathewson**: Same objection to this.

Mr. **Page**: All this line is taken subject to the same objection and ruling and exception, I presume, is it not?

The **Master**: Yes.

Mr. **Mathewson**: Very good; that satisfies me.

The **Witness**: I think a coal gas plant would cost about between $250 and $270 per thousand daily capacity.

Q. What is it that makes the range of $250 to $270?

A. Well, it would be according to the style in which it was built. If it was built in the plainest and still substantial manner, it might be reduced to $250; and if it was somewhat elaborated and made of such construction as we frequently see put in gas plants where they want to, as you may say, put on some style, it may be as high as $270.

Q. What would you estimate the cost of a 22 candle power water gas plant per thousand daily capacity? I mean by that a water gas plant capable of producing gas of 22 candle power.

Mr. **Mathewson**: Situated in the Borough of Manhattan?

Mr. **Page**: Yes.

A. I think that ought to be accomplished within the limit of $125 to $130 per thousand daily capacity, maximum.

Q. What would you estimate the cost of an oil and water gas plant to produce 50 candle power gas per thousand cubic feet of daily capacity?

A. About $100 per thousand; that is, if built on a very large scale; if built on a moderate scale those prices would be somewhat increased.

5242 Q. Are these estimates which you have given the cost to reproduce plants which would manufacture the gas that was testified heretofore as to the cost price?

A. Yes, sir; that is my opinion.

Q. And the various mixtures of coal and oil and water gas, and of the water gas, of which you have testified?

A. Yes, sir.

Mr. PAGE: That is all. The case is in your hands, Mr. Mathewson, as far as this witness is concerned. When are you going to cross-examine him?

Mr. MATHEWSON: That is all for you, is it?

Mr. PAGE: Yes.

Mr. MATHEWSON: Is there any further testimony on behalf of the other defendants?

The MASTER: Have you anything further, Mr. Burr?

Mr. BURR: What is the situation now?

Mr. PAGE: We have finished.

Mr. BURR: I have not anything further.

Mr. MATHEWSON: About Mr. Edgerton, I shall not want him probably until about two o'clock. I cannot get a chance to look at these things. I do not quite see how I will be able to look at these things and begin the cross-examination before to-morrow morning. In other words, if I get through with Mr. Marsh this morning, it would be hardly possible for me to get anything to eat and look at these things. Would it not be well to postpone Mr. Edgerton's cross-examination until to-morrow morning?

The MASTER: You are the best judge of that.

Mr. PAGE: It is within our time. You can use it as you wish.

Mr. MATHEWSON: Yes. Of course I consented to putting 5243 this testimony in in this shape, and the result is that while it takes time to look at it, we save time in the long run.

Mr. PAGE: We are agreeable to anything you wish.

The MASTER: He only wants to know whether you will want Mr. Edgerton to sit around here all day?

Mr. MATHEWSON: I think he had better come to-morrow morning.

Mr. PAGE: Very well.

WILLIAM D. MARKS, recalled for cross-examination, testified as follows:

Mr. MATHEWSON: Before Mr. Page and Mr. Kirby go, as they represent the Gas Commission of the State of New York, or the members of it who are defendants, I ought, I think, to call the attention of the Master to the fact that while the secretary of the Commission brought here these documents in the custody of the Commission, and you will recall, was to permit us to examine the reports in the office, and counsel assented, we are having some difficulty in getting permission, and we have now been held off for a couple of weeks, and have not been able to see them.

Mr. PAGE: I am glad you brought that up.

Mr. MATHEWSON: We just got a letter from Mr. Hazzard this morning.

Mr. PAGE: I did not hear of that difficulty until the other day, and I went down to see them, but the Commissioners had gone away. I will give you full access to them if I have to get an order from the Governor.

5244 Cross-examination by Mr. MATHEWSON:

Q. Doctor, I think you said that you do not manufacture gas apparatus; did I ask you that question?

A. I do not, sir.

Q. Nor are you in the business of a seller of gas apparatus, are you?

A. I do not sell any machinery; I am a consulting engineer.

Q. And have you ever constructed a gas plant in the Island of Manhattan?

A. Never.

Q. You say you began the inspection of these plants from the 17th of December?

A. 21st Street, if I remember rightly—no, the 42nd Street.

Q. Yes. And your inspection of the plants covered more or less of the time from the 17th of December up to what date?

A. Up to December 31st; that is to the last day in the year.

Q. Inclusive?

A. My continuous inspection——

Q. No, but was it December 31st inclusive?

A. Inclusive, if I remember rightly.

Q. Now, you began at 42nd Street on the 17th of December and on the first date, December 17th, you came about half-past one and remained until five, didn't you?

A. I can give you the exact hour; if I remember rightly, I examined the walls, the outside of the buildings, located the matter geographically and reported to the office somewhere about one o'clock, after going the rounds outside, so as to topographically enlighten myself as to localities.

Q. That was without entering the works?

A. Without entering the works. It was necessary in order to get a clear idea and know how everything lay, on my first visit to them.

Q. You first went into the 42nd Street Works on December 17th and was there from about 1.30 P. M. to 5 P. M., were you not?

5245 A. Well, I cannot recollect exactly; I know I was there during the afternoon.

Q. That was about right, wasn't it?

A. Yes, it seems about right.

Q. And you returned on December 18th at 10.30 A. M., and remained until about 3.30 P. M., is that right?

A. That appears to be about the whole time that I was on the interior of the works; I subsequently visited and walked around the outside for the purpose of getting a general idea of the condition of the walls and buildings from the exterior.

Q. Well, having finished with the 42nd Street plant, which next did you inspect?

A. The next appears to be on December 19th, 21st Street Station.

Q. And on that day you entered the plant about 11 o'clock in the morning, didn't you?

A. It is marked here 11 A. M.

Mr. Burr: On the morning of the 19th.

The Witness: Of the 19th. I should say to you that that entry in every case was preceded by a general topographical survey, going around all the physical property.

Q. That is walking around the streets outside of the works?

A. So as to locate the various pieces of property.

Q. You mean walking around in the different streets outside of the works so as to see the outside of the works from the street?

A. That is it, to locate them in their relative position.

Q. Well, we will understand that as to each plant without your repeating it?

A. Yes.

Q. Now, you entered the 21st Street plant on December 19th at 11 A. M., for your examination. What time did you leave on that day?

5246 A. The last entry is for the retort house December 19th, 5 P. M., that means after 5 o'clock.

Q. Yes. Then on December 20th you went again in the morning, remaining until about 12 o'clock noon, making the actual time spent in the 21st Street Works on December 19th and 20th about eight hours. That is correct, is it not?

A. Leaving between 12 and 1 on the same day.

Mr. Burr: What was that, the 20th of December?

The Witness: The 20th of December.

Q. Making about eight hours for the two days at the 21st Street plant?

A. It was all that was possible under the circumstances——

Q. I know that, Doctor, but——

A. I think about that, yes.

Q. You made no actual measurement during this inspection of the 21st Street plant, did you?

A. I paced off some of the greater distances as given by Mr. Mayer and generally found them correct.

Q. But you took no actual measurements by tape?

A. No, used no tape; it was impossible.

Q. In this or any of the plants?

A. In none of the plants did I use any.

Q. And such measurements as you made were eye measurements or paced measurements or something of that sort?

A. Yes.

Q. And is it not a fact that you found Mr. Mayer's descriptions of sizes of apparatus and plants were substantially accurate so far as they were given in the schedules which you had?

A. I think that Mr. Mayer's measurements were correct in all cases that I examined. There were a few typographical errors, the locality of which I cannot recall now, which at first appeared to be incorrect and afterwards in the summations showed that they 5247 were typographical errors and not original mistakes; at least it appeared so to me.

Q. Now, you went from 21st Street to the 44th Street plant, did you not?

A. 44th Street plant is marked December 21, 10 to 11 A. M.

Q. 44th Street plant, 10 to 11 A. M., December 21st?

A. December 21st.

Q. Was that the entire time that you were inside the 44th Street station?

A. Oh, no.

Q. Very good, give us the rest?

A. I visited the exterior and boiler house December 20, between 4 and 5 P. M.

Q. Well, as a matter of fact, were you not at the 44th Street plant from about 2.15 Thursday until about 4.15 of that day and then on the following morning you were present from about 11 to 12 o'clock, did you say, or 10 to 11?

A. I am looking that up. I was there at the engine and exhauster house December 20, at 2 P. M.

Q. Yes. And you remained in the plant how long on that day?

A. Until between 4 and 5 o'clock on December 20th.

Q. Well, that would make how many hours for the two days, about?

A. Apparently on December 21st, between two and three hours, and on December 20th, between four and five hours, or three and four hours, I don't know which.

Mr. Burr: Say altogether about eight hours.

The Witness: Something like that.

Q. Well, Doctor, won't you think a moment and see if it is not the fact that you arrived there on the 20th at about a quarter past two and left about a quarter past four, making two hours; and then on the next morning you arrived at about half-past ten and left about 12:15, which was about an hour and three-quarters?

5248 A. Oh, it may have been; it is simply a question of seeing and identifying things as rapidly as possible, that is all.

Q. What plant did you next visit?

A. The 99th Street station appears as checked December 21st, 1 P. M.; that must mean between 1 and 2; that is the first.

Q. Were you in the 99th Street plant at any other time than that, which you have just stated?

A. Not inside of it, but outside of it forming an opinion as to depreciation twice subsequently.

Q. That is walking around the outside of it in the street?

A. Pacing the length of the walls; examining the brick work and the roofs, and generally forming an opinion as to its antiquity.

Q. How much time did you spend in the interior inspection?

A. On one day traveling to and from the office, nearly three hours. On another day about two. I don't recall the day. I was sorry to go, but I——

Q. But I mean about the exterior of this plant?

A. I should say a couple of hours altogether.

Q. After the 99th Street plant you examined what plant?

A. On December 22nd, I examined the 111th Street station, the Inwood station, the 132nd Street station and 65th Street station.

Q. What time did you enter the 111th Street station and how long a time did you spend in the station?

A. Apparently, I entered the 111th Street station at noon, 12 o'clock——no, at 11 o'clock.

Mr. Burr: Your answer is that you entered there at 11 o'clock?

The Witness: At 11 o'clock, and I examined the last detail of the stable between 1:30 and 2.

Q. Then you went to 132nd Street, you say, and how long a time did your examination there consume on December 22d?

5249 A. Between 2 and 3 P. M.

Q. And then at Inwood, what time did you take?

A. Between three and four; and 65th Street between four and five.

Q. At 65th Street you arrived on December 22d at 4:15 and remained until five, did you not?

A. I said between four and five. I have it marked here.

Q. Well, then, what station did you then visit after the 65th Street station?

A. The 63rd Street station on December 24th, 10 A. M. There may be something wrong about that, that may have been December 23rd.

Q. No, it was December 24th, according to my memorandum. December 23rd was Sunday, you know?

A. I did not know that, because it did not make any difference in my works since I have been connected with this trial.

Q. Then on December 24th you visited the 63rd Street station, and you were in that station from about 10:30 A. M. until 11 A. M. on that day, were you not?

A. That was about as recorded.

Q. Now, how about 18th Street?

A. 18th Street was reached December 24th, at noon.

Q. And how long did you remain at 18th Street station? You remained there until about one o'clock, didn't you?

A. It must have been a little after one, sir. I see it is marked one here.

Q. That is not the reason you think it was after one, is it?

A. Between one and two it would be always marked one, and if two o'clock, between two and three, and so on.

Q. Have you testified what time you spent in inspecting the 14th Street plant, which is the only one left?

A. I did in my testimony mention the fact that I spent with others, I think, the better part of a week.

5250 Q. In the 14th Street plant?

A. In the 14th Street plant.

Q. Now, to be quite fair to you, it was absolutely physically impossible, was it not, to have examined all these plants, excluding 14th Street, within the time that you had to examine them and verify measurements of apparatus and the descriptions generally of the apparatus in the detail which Mr. Mayer had described it in his schedules?

A. I could not have made those measurements in as many months as I used days, apparently.

Q. And your observation of the apparatus, so far as you could make it in comparing it with the data and descriptions which Mr. Mayer gave, proved Mr. Mayer's data to be so substantially accurate that you were willing to accept his descriptions as fair descriptions of the apparatus?

A. The physical descriptions in no case did I find to be out; although they may have been out, in no case that I investigated were the physical measurements and descriptions given by Mr. Mayer wrong.

Q. Now, Mr. Mayer in his appraisal of the plants divided the property into four classes: buildings, apparatus and contents, connections and holders; is it not the fact that as to the last three classes, that is to say apparatus and contents of buildings, connections and holders Mr. Mayer's estimate of first cost or actual cost new was substantially correct, according to your judgment?

A. I accepted Mr. Mayer's statement as to yard connections without any criticism at all, based on my general results on the measurements on the other apparatus inside of the building. His apparatus as far as structural or first cost was concerned, with a few—and I think those were not large—exceptions, did not differ essentially from such figures as I could obtain.

Q. And the same was true as to the first cost of holders, was it not?

A. In the case of holders the difference was somewhat

5251 greater, but it was not a serious difference.

Q. So that we may say, speaking generally, that you accepted his values of yard connections, and that as to apparatus and contents and holders, Mr. Mayer's testimony as to first cost or original cost was substantially correct, according to your view?

A. It was.

Q. And that you differed with him chiefly as to the amount of depreciation that should be allowed on first cost, considering the present condition of the machinery?

A. And also the valuation of the buildings?

Q. Yes, but I am leaving buildings out?

A. Yes.

Q. Then leaving buildings out, you would quarrel with Mr. Mayer's figures as to apparatus and contents and holders with reference only to the amount for depreciation that should be allowed off original cost?

A. That is right.

Q. That reduces the subject, then, to the question of this depreciation and the cost of buildings. The statement that you have put in as part of your evidence shows your estimate of the original cost of buildings, as well as of depreciation, does it not?

A. It does.

Q. The duties of a consulting engineer do not include the construction as a contractor of buildings, do they?

A. It is an injury to a consulting engineer to become a contractor.

Q. But you have not as a contractor constructed buildings in the Island of Manhattan?

A. Never.

Q. Nor as an owner of buildings?

A. Nor as an owner.

Q. In reference to the 14th Street plant, the valuation of $1,460,064 at page 5063 of the testimony appears to be reached on a different basis from that which you have chosen in passing upon the value of the buildings and apparatus in the case of the other
5252 plants; that is right, is it not?

A. That is right. That is, it differs in this respect, that in the 14th Street plant I accept in a lump sum the figures given by Mr. Rowland, while in the case of all the other stations I verified each and every item. While at the 14th Street station there were three men engaged in overlooking the apparatus, at all the other stations I was alone; with the result that it was quite possible to accomplish many times the amount of work that you could where there were three.

Q. In other words, for the 14th Street plant you took the appraisal of Mr. Rowland as to certain buildings and apparatus as $1,706,294?

A. Yes.

Q. And you deducted from that depreciation on the basis of fifty years expiration at .85 of one per cent. per annum, making 42½ per cent., or in dollars $725,175?

A. Yes.

Q. And left a balance of $981,119. I am correct so far, am I not? That is page 5063?

A. Yes.

Q. And then you added to that what you considered property added since 1884?

A. Yes.

Q. Bringing up your total to $1,464,064?

A. Yes, I did.

Q. Now, Doctor, did you figure up the amount which you have taken off by way of depreciation from the cost of these plants in order to reach your total of the $9,348,692 shown at pages 5058 and 5108 for all the plants?

A. I turned in a completed schedule of those.

Q. Yes, but I did not see the total of your valuations of plant before deduction of depreciation?

A. Nor did I obtain that.

Q. Well, now, I will ask you if you will not in a moment, in order to form a basis for our computation, figure up the amounts which you have deducted for depreciation. If you will take a piece of paper, I have it here, and I think I can assist you so we can get it in a few minutes?

5253 A. There was a complete schedule in good shape turned in yesterday.

Q. Yes, it is on the record. Now, taking these appraisals of the different plants in order; if I am correct, you deducted for 14th Street (p. 5063 of the record), for depreciation, three items, to wit, $725,175, $13,200 and $6,472, making a total——

A. One moment.

Q. Making a total of $744,847 total depreciation, deducted from first cost?

A. Yes, sir.

Q. Now, for 42nd Street (p. 5064 of the record) you deducted depreciation of $472,182?

A. $472,182.

Q. And for 44th Street (p. 5069 of the record) you deducted a depreciation of $132,808, and for 21st Street (p. 5076 of the record) you deducted depreciation 28 per cent. of the plant, or $612,304?

A. Correct.

Q. And for 99th Street (p. 5084 of the record) you deduct 21 per cent. of the plant, or $129,974?

A. $129,974.

Q. And from the 18th Street (p. 5089 of the record) you deducted 42½ per cent., or $165,290?

A. $165,290.

Q. And from the 63rd Street station (record, p. 5093) you deduce 10 per cent., or $43,644?

A. $43,644.

Q. And for 65th Street (record, p. 5095) you deduct 20 per cent., or $81,499?

A. $81,499.

Q. And for 111th Street (record, p. 5098) you deduct 30 per cent. for depreciation and 30 per cent. for depreciation, neglect and decay, amounting to 60 per cent. of the entire plant, or $96,780?

A. $96,780.

Q. And for the 132nd Street station, I find no deduction (record, pp. 5102-03)?

5254 A. The 132d Street station exceeds Mr. Mayer's valuation by about three thousand dollars, being entirely new and in excellent condition.

Q. And at Inwood (record, p. 5103) you seem to have made a deduction, as nearly as I can make it, of the difference between $20,300 and $10,596; that is, original cost and the value as you state it, or $9,704. Is that right, or is the depreciation greater than that? It was not clear.

A. I make it $9,704.

Q. Now, won't you tell me how much depreciation that makes, all told, that you have deducted from first cost?

A. Unless I made some error in addition, $2,488,832.

Q. Well, that is within a few hundred dollars of my hasty computation, Doctor, and it is undoubtedly substantially correct. We will take it without further verifying.

A. Two and one-half millions.

Q. Now, will you add that amount of depreciation to your $9,348,692 which you have as the net value, and say what that would make for the original cost?

A. $11,837,524.

Q. Now, Mr. Mayer's figures of original cost, which you have stated you approve in substance, he testified was the amount which the company would actually have to pay to contractors to instal the plant and apparatus. You understand that to be the case, do you not?

A. I so understood Mr. Maver.

Q. Now, there is an engineering item, including the grading, sewering, laying out of the plant, inspection, superintendence, and other items, which the company has to meet in addition to that which Mr. Mayer and other witnesses have testified was relatively ten per cent. That is a fair figure, isn't it, Dr. Marks, ten per cent.?

A. No, it is not in the case of an inventory. In the case of an estimate an engineer will add ten per cent., five per cent. or fifteen
per cent. for things he has not foreseen. In the case of an
5255 inventory the apparatus is all there for examination, and you
are expected to give its valuation, as Mr. Rowland did, without any additional percentage.

Q. I am not referring now to the things which are unforeseen, but to the things which are foreseen. It is true, is it not, that a company in establishing a plant must necessarily have an engineering force which lays out the plant; it must have inspectors and superintendents; it must have grade and cut a field; it must drain, and it must do many other things which it does not pay the contractor for who instals the plant or builds the building; that is clear, isn't it?

A. Yes.

Q. Now, supposing that that amounts to ten per cent., as the other witnesses have testified, in addition to this contractor's payment, that would mean an additional expense to the company?

A. The drainage of a plant bears no relation to the apparatus upon it. There is no ten per cent., or five per cent., or fifteen per cent.

Q. No, I am speaking about the expenditure that the company must go to in order to have its complete plants in working and operating condition in addition to the bills which it pays the contractor for simply bringing the apparatus and installing it and erecting the building?

A. Yes.

Q. Yes. Now, those additional items of engineering expense in laying out the plant originally, which the company has to pay, and draining, which is always part of a plant on low ground, and the cutting and filling and grading, which, of course, is paid for?

A. Yes.

Q. (Continuing). The company has to meet additionally, and I am now trying to get at what that would mean, plus the valuation of the plant representing the amount paid to the contractors to instal
it. Now, if ten per cent. is a figure for those things, those ad-
5256 ditional expenses to the company before it gets started, that
would mean something in addition to the $11,837,524, which you have mentioned, an additional expense to the company, wouldn't it?

A. If that is not included then there would have to be an additional allowance.

Q. Well, from your observation, Mr. Mayer did not include it, but expressly excluded it, and added the ten per cent. subsequently, and in that he was confirmed by Dr. Humphreys, who said that his experience was nearer fifteen per cent. Now, won't you add ten per cent. to this $11,837,524, and see what that would make, assuming that ten per cent. is to be taken into consideration?

A. Acting as your computer, $13,021,476.

Q. Well, everyone seemed to concede, including Mr. Logan, that the construction of a plant of this kind would take *in toto* more than two years, and it was assumed therefore that the interest for one year at say five per cent. was a low figure. We have not added any interest yet, and how much would five per cent. amount to in this valuation of plant, if you will be good enough to act as my computor, and add it, Doctor?

A. $13,612,952.

Q. Now, that excludes, I understand, the 18th Street plant, which was taken by the City——

A. Abandoned.

Q. Whether it has been paid for or not. Yes, and where does your foundation of apparatus come in in this total? Did you include your foundation of apparatus in your valuation of buildings?

A. In every case more than included. I was exceedingly liberal.

Q. Then we will take those up one at a time, but as a matter of fact they are included in the buildings?

A. Except where I have specifically named them in my inventory.

Q. Now, refer to page 5063 of the record, where you de-
5257 duct for depreciation, fifty years, at .85 of one per cent.,
amounting to 42½ per cent. for the 14th Street plant, and follow the same method of computation in other plants. I understand you get this .85 of one per cent. by taking the depreciation charged off as shown in City's Exhibit 87 (Exhibits, p. 1466) amounting to a little over $220,000, and assuming that to be the depreciation rate fixed by the directors of the Consolidated Company in the resolution which is described in the Exhibit, is that right?

A. I cannot answer that directly. It is the very least depreciation that could be admitted.

Q. But let us get at how you reach the .85 of one per cent. Didn't you testify heretofore that you reached that by assuming a capitalization of two dollars per thousand and applying this depreciation shown at page 1466 of the Exhibit book to that, on the ground that that was a normal depreciation?

A. On the ground that that was the very lowest depreciation. I will explain to you——

Q. You took the .85 of one per cent. on the ground that that was the rate fixed by the Board of Directors in this resolution?

A. Yes.

Q. Now, in order to be consistent, because we must be that whatever else we are, let us look at that page 1466 of Exhibits for a minute and see if that does not deal with depreciation on not only plant which we are now dealing with, but mains, services, meters and so forth—you remember that it does?

A. Oh, yes.

Q. Now, let us take the amount for plant which was charged off for depreciation that year, which was $3,424. Will you put it down there? And now will you divide that by the valuation of plant, excluding ten per cent. for the company's engineering and miscellaneous expenses and the five per cent. for interest, to wit, $11,837,524, or compute it in any other way that you please, so that we 5258 can see whether on plants the directors did charge off .85 of one per cent. in 1905, even assuming a two dollar per thousand valuation. In other words, what per cent. did the company charge off in the year 1905 of the valuation of plant, even as you have given it, $11,837,524 original value?

A. The two dollars of which I spoke included everything, beginning with the real estate and ending with the meter structural cost.

Q. Yes, I know; that is a general proposition. We are now coming down to this direct resolution and seeing how much depreciation on plants the directors charged off, you having stated in a previous statement that you assumed that they charged what they thought was a fair rate for depreciation?

A. Yes. Now it would be impossible to take a single entry for a single year of the single operation of a plant as an average. It is quite fair to take the average depreciation throughout the whole plant straight through, covering, as I say, everything from the building straight through to the meters, as has been done here. In other words, that single entry would be absurd for the very simple reason that the United States Government in reckoning its depreciation on brick buildings gives from one to one and one-quarter per cent. or one and one-half per cent., and on wooden buildings from two to two and one-half to three per cent. That is what is known as the Tiffany Estimate Standard.

Q. And if the Government expends on its buildings to offset that depreciation the proper amount year by year it can keep those buildings in repair and in good condition for an indefinite period, can it not?

A. Possibly it might, but in checking up——

Q. You do not understand when the Government charges off those rates to depreciation it spends nothing to make good that depreciation but merely allows the building to rot away year by 5259 year, do you?

A. Oh, no, but it fixes the life of the building.

Q. I will come to the buildings a little later. I am now on another point. Do you mean to say that you can take a single year for depreciation or for repairs and renewals spent on a plant and say that that necessarily represents a fair average?

A. I beg your pardon. I accepted it as the very lowest possible figure that can be——

Q. Yes, you understood that that was on a fair average for depreciation which the company had shown by its experience for the past twenty years, didn't you?

A. Had that been left to me to fix the depreciation I would certainly have fixed it at one per cent. or a trifle over it, as a matter of my own judgment.

Q. But we are now speaking about the amount which is to be charged to depreciation year by year as a normal amount?

A. Yes.

Q. In order to get that you say you would have to take the average of a considerable period, the same as Mr. Hall said, wouldn't you?

A. Why, certainly. All of the whole outfit for any one year, not any particular item of the outfit.

Q. But could you take the depreciation or the repairs and renewals even for the whole outfit of the company for a single year and say that they represent in every case an average, a normal rate?

A. You could not, but you might accept it as the minimum, lowest allowable amount, which happened to be fixed by the Board of Directors in this case .85 of one per cent.

Q. And if that was less than the average or normal amount it would be as Mr. Hall said and as I think you said and certainly as Prof. Bemis said, equalizing in considering the cost of gas by adding to it a sufficient amount to make up a fair average?

A. Something of that sort, yes.

5260 Q. Now you have taken from that the year 1905, in computing this .85 of one per cent., and will you tell me how much per cent. the company charged off in 1905 on the plant—my original question; whether it is right or wrong is another proposition?

A. Do you refer to the $11,837,524.

Q. Yes, your original cost, because the cost of depreciation would cut off the value.

A. Why, it is a very small fraction of one per cent.

Q. It is about .02 of one per cent., isn't it?

A. Nearer .03.

Q. Well, call it .03 of [illegible] per cent?

A. .03 of one per cent.

Q. How much depreciation would that amount to if applieed to your $11,837,524?

A. Well, that is the same thing, I have just given it to you.

Q. Yes, but I say computed on that—that would be then $3,424, wouldn't it?

A. Yes.

Q. Instead of your depreciation of .85 of one per cent.?

A. Yes.

Q. What would that be, .85 of one per cent.?

A. On that amount?

Q. Yes. It would amount to a little over $100,000, wouldn't it?

A. $100,617.95.

Q. Now, as a matter of fact, if you take the depreciation item applying to an entire plant you would be unfair to buildings, would you not, because buildings do not depreciate so rapidly as meters and services and horses and wagons, and things of that sort, which form a part of the property of the company, do they?

A. Buildings do not depreciate as rapidly as the items you mention, but far more rapidly than other items that are used in a gas plant.

Q. Such as what?

A. Gas mains, for instance.

Q. But not so fast as apparatus in the plant?

A. But that depends altogether on the characteristics of the apparatus and the material from which it is made.

5261 Q. Now, in your testimony respecting 14th Street, as shown in the tables at page 5063 of the record, you show 42½ per cent. of the total amount for depreciation on property of 1884. Do you take into account that large sums have been expended in replacements and renewals of certain depreciation on those plants within the last twenty years?

A. I have es-imated in every case that all the money that was necessary to keep the buildings in the most perfect repair possible had been expended and this depreciation gave for .85 of one per cent. a total life of nearly one hundred and twenty years to each building and to each piece of apparatus, from which I assumed that it would have outlived its usefulness, become obsolete and inadequate.

Q. That then, is not physical deterioration, but presents the possibility of abandonment or disuse at some future time; is that right?

A. It represents obsolescence or inadequacy within one hundred and twenty years from the time of its installation.

At 12.55 P. M. a recess for lunch was declared until 2.15 P. M.

5262 Afternoon Session.

William D. Marks resumed.

By Mr. Mathewson:

Q. I find that you testified quite fully in reference to what this .85 of one per cent. covered in depreciation as to the 14th Street plant, and I assume that the same theory applies where you have applied .85 of one per cent. to the other plants?

A. Yes.

Q. So that it will not be necessary to ask specifically about those?

A. No.

Q. I also examined you quite at length on cross-examination in reference to this statement in regard to the 14th Street plant, which you have now put in in this tabulated form.

A. Corrected within the figures as it was finally corrected in my testimony.

Q. Yes. Now, take the 42nd Street plant, a summary of which appears at page 5064. You found that plant, as well as the 14th Street plant and the other manufacturing plants, in operation, did you not, Doctor?

A. I did.

Q. And it is your information, is it not, that those manufacturing plants are making as much or more gas than they ever did before, and have made it at a lower cost within the last year?

A. That would be purely hearsay.

Q. You heard the testimony to that effect of Mr. Bradley, or one of the other officers, and you have no information to the contrary?

A. I have no information to the contrary.

Q. Now, you take the total actual first cost of buildings as $425,810.14. You say that included foundations of apparatus. Will you be good enough to state, referring to the different houses constituting those buildings as they appear on page 5065 of the
5263 record, what foundations you included in each case?

A. Referring to the 42nd Street station, and to the inventory items 1 and 2, there are——

Q. Just say what they are, because they are referred to in other places. Do you mean the valve house?

A. The valve house and vault have no specific allowance for foundation. Item 3, meter house, includes an allowance for the meter within it. Items 4 and 5, purifying house and extension foundation, and foundation for boxes and brick piers, is pretty nearly all the allowance for foundations; it is a frame building.

Q. Foundation for apparatus or foundation for the building?

A. For the building and for the apparatus.

Q. For what apparatus?

A. The purifying boxes; the building in that case is a one-story frame building, roof trusses given away and supported, and most of the timber work in process of decay and sagging.

Q. My question, Doctor, was simply what foundations of apparatus you included in your estimate of building in each one of these cases; that was all.

A. Yes. Item 6. Engine house, meter house and office, includes the allowance for foundation for exhausters, for horizontal engine, and for three meters. There was a special extra allowance in that case on account of the multiplicity of foundations in that case.

Q. What was the extra allowance included in that?

A. There was special extra allowance in that case of something like $2,168 in addition to the cost of the rest of the building. Usually it is included within the figures given. Item 9, retort house and retort house basement and bench foundations, that is for sixty benches; there was a special computation made in that case too, amounting to some twenty-eight thousand dollars of the total given of $112,692.

Mr. Burr: For foundations?

5264 The Witness: For foundations. Item 10, condenser and scrubber house, there was an allowance made for two scrubbers, air condenser and a cast iron box, use unknown. Item 11, retort houses No. 2 and No. 3, there was an allowance made for six benches of six, fourteen benches of six, including also the walls of the basement.

The MASTER: What do you mean, for foundations?

The WITNESS: For foundations, yes, sir.

Q. Can you give the amount of that allowance?

A. The amount of the allowance for the walls of the basement and the retort benches foundations amount to $20,465.

Item 12, vault under the sidewalk. There is no allowance for foundation there, merely for the vault itself.

Item 13, exhauster, engine and scrubber house, both the foundations and the buildings are lumped there.

Q. Foundations for what?

A. For the exhauster and for a Greenfield engine, a No. 10 Mackenzie exhauster, two large Mackenzie exhausters, one 16 x 30 horizontal engine, one 8 x 8 Greenfield engine, rotary washer, Greenfield engine, a multitubular condenser, two oil gas scrubbers, an oil gas condenser. In other words, as I remember it now, you may say the whole basement almost was filled in so closely with foundations for various pieces of apparatus.

Q. Did you separate the allowance for each foundation, or did you compute separately the foundation for each piece of apparatus?

A. No, in that case that was beyond me. I just lumped it. The cellar was filled in, if I recall it rightly; I do not remember it exactly, but I think the cellar was just filled in.

5265 Q. Do you remember whether these foundations were brick or stone or cement, or what they were, respectively?

A. If I remember rightly, every one of these pieces of apparatus had a cut stone cap to a foundation underneath it, and this was figured as being ordinary foundation work in the way of stone. I have not got those figures with me, but I think it was figured the same as the building; that is, the cubical contents.

Q. How much did you allow for excavation for the foundations of these several pieces of apparatus?

A. The foundations in a case of that sort being adjacent to a place where it required a great deal of filling in, at the outside could not have cost for excavation fifty cents a cubic yard; that was my judgment in the matter. Of course, it was largely judgment. They required the dirt elsewhere there.

Q. In the case of these various plants, 42nd Street and others, did you allow for rock excavation in reference to holders or other apparatus?

A. In the matter of the holders, you will find that practically as far as the tanks were concerned in round figures I accepted, having no other means, either the estimate of Mr. Mayer or of Mr. Rowland very closely.

Q. Well, take the excavation for the foundations of the buildings and foundations of the apparatus which you have included in buildings. Did you allow for rock excavation in those cases?

A. In no case, in the cast of buildings, did I allow for rock excavation; always fixing the work at what might be called regulation prices for heavy excavation.

Q. Well, but rock excavation is much more expensive than dirt excavation, isn't it?

A. Rock excavation will cost you about five dollars a cubic yard blasted out.

Q. What do you call regular excavation, dirt excavation?

5266 A. Either at ten cents per cubic foot, making $2.70 a yard, or at fifteen cents it would make about $4.00 a cubic yard, and one or the other of them have been used, including both the excavation and the structure inside the excavation.

Q. Did you allow for the piling in these foundations of these various works?

A. In every building where I could learn—I accepted this on faith entirely—that piling had been used in the foundations, I used fifteen cents per cubic foot for the buildings, in the place of ten cents which I would have used in the case of ordinary foundation.

Q. In the case of ordinary foundation as you term it, what did you allow additional to your ten cents for a unit figure for dumping privileges, etc., in relation to the earth which was removed?

A. You mean in each station?

Q. Yes, did you make allowance for that?

A. Of course, this is hasty work, but so far as my judgment went, every bit that could be dug in any of these tidewater stations was worth a great deal to the company itself; they ought to have been very glad to get it, to build out over the lowland back of their bulkheads and into their piers.

Q. But even that would involve some transportation——

A. A haul of a few hundred feet.

Q. And so on?

A. Yes.

Q. A great many of these plants you found had no bulkhead next to them that they were using or that apparently belonged to them, didn't you?

A. Not where I noticed a large amount of excavation, except for gas holders.

Q. Well, for whatever it may be?

A. Yes, I say except for gas holders.

Q. But you made no special allowance for that?

A. No, I did not.

Q. Now, you might proceed with these various buildings.

A. Fourteen is the next, retort house No. 4, marked "Exhibits." It should be experimental retort house.

5267 By Mr. Burr:

Q. Does that need to be corrected?

A. Yes.

Q. Instead of Exhibits it should be Experimental?

A. Yes.

Q. What do you mean by Experimental?

A. It is a little retort house with three benches in it which apparently is used for all sorts of experiments and at the present moment has some mysterious arrangement in it not in use. That also is all lumped in one computation at $4,631.12.

By Mr. **Mathewson**:

Q. You did not separate that into its items?

A. No.

Q. I suppose about all the chance you had was to make a general survey and then a general estimate, was it?

A. I visited the cellar of this experimental retort house and examined the foundations to see if there was anything there and found that it was practically abandoned and used as a water closet by the men. Going on down as far as brick fence, Item 22, all the other foundations have been included in the estimate for the buildings, foundations for trestles and that sort of thing, and not separately computed.

Q. That is, you made a lump estimate for the building including the foundations without computing each separately?

A. Yes, without computing each separately, making a lump estimate. In the case of most of these foundations where I learned that they were very heavy indeed, my time being preposterously limited, I made as good an estimate as I could of what was below ground; but always in that case included the walls of the building which supported the building, as well as the foundation for the machinery, although I visited every one of them and looked at them very carefully.

5268 Q. Can you tell me now where and to what extent you allowed for pile foundations in these various plants?

A. Now, let us see. Item 11, retort houses 2 and 3 pile foundations, an allowance of 5 cents per cubic foot for the capacity of the whole building. Item 10, condenser and scrubber house, pile foundation, allowance of 5 cents per cubic foot for the capacity of the whole building.

Item 9, retort house, allowance of five cents per cubic foot for the whole building.

Item 1, valve house, allowance of five cents per cubic foot for pile foundations.

Item 20, coal shed No. 2, allowance of five cents for pile foundations.

Item 31, deodorizer house shed, an allowance of five cents for pile foundations. Those are all I can find on my computation.

Q. Will you give me the basis on which you computed this five cents—per cubic foot, was it?

A. Per cubic foot, yes, sir. The computation of buildings by means of the cubic foot capacity, except where the buildings are very closely of the same general dimensions of building is incorrect and untrustworthy. Taking a building 50 feet long, 50 feet wide, and 25 feet wide, with walls twelve inches thick, and bricklaying at $25 per thousand kiln count, and the roof at 30 cents per square foot, we find the cubic contents of that building to be 18,750 cubic feet, and the cost $1,525, or 8.1 cents per cubic foot. Taking another building 100x30 feet x 25 feet high, with walls 16 inches thick and at prices of brickwork and roof the same, its cubic contents are 75,000 cubic feet and its cost for the plain building as $4,358, or 5.8 cents per cubic foot——

Q. That is on your estimate of cost?

A. Yes. Taking a building 200 feet long by 60 feet wide 5269 by 25 feet high, with walls twenty inches thick, and the cost of brickwork and of roofing being the same as in the previous cases, its cubic contents are 300,000 cubic feet, and its cost is $12,284 or 4.1 cents per cubic foot. This is a simple building with the foundations extending in brick five feet below the surface of the ground, the walls rising twenty feet about the ground and surmounted by a slate roof, and is what might be called a rough type of the retort house, such as you see.

Q. You mean the building which you have supposed in your testimony, or some particular building at this 42d Street plant is of that character?

A. It is of the general type of the retort house, is what I am speaking of.

Q. You have not quite told me yet on what basis you computed the five cents per cubic foot on account of piling. I mean five cents per cubic foot for the entire contents of the building in this particular case?

A. Referring now to what I have just explained, 10 cents is taken instead of 4.1 cents in the case of a retort house with ordinary foundation.

Mr. Burr: That is, you allow ten cents.

The Witness: I allow 10 cents in the place of 4.1 cents in a retort house with ordinary foundations. But when you get to pile driving, and I know this from practical experience, there are many factors enter in to make it slow, troublesome and costly, and so I simply added fifty per cent., or five cents per cubic foot for the cost of any building that had to be put up on piles.

Q. How deep did you assume the piles to be, how long?

A. I had but one or two opportunities to learn anything in regard to the nature of the piling there, and on that I based my pile work at from five dollars to $7.50 apiece for piles.

5270 Q. Well, that would be piles of how long?

A. Oh, twenty to twenty-five feet, or thirty, not large piles, just ordinary small piles such as would be driven under a wall.

Q. Now, you found some re-enforced concrete foundations, didn't you, for buildings or apparatus in the various plants of the Consolidated?

A. If I remember rightly at the 65th Street station there was a very elaborate statement of heavy stone wall and of concr-te work, and of interior retaining walls, all of which required a considerable amount of time for computation and for checking out, amounting to a considerable amount of money.

Q. Well, did you find any re-enforced concrete foundations under ground?

A. Pardon me. A re-enforced concrete is a concrete that is braced with wrought iron.

Q. Yes. Well, on your own definition, did you find any re-enforced concrete foundations underground?

A. I did not.

Q. Then, of course, you did not make any allowance for any, not having found them.

A. Not having found them, and it would not make very much difference in either case.

Q. Well, what figure per cubic yard yould you put on re-enforced concrete foundations under ground?

A. About seven dollars per cubic yard plus the cost of any iron that was worked into them, if I could find how much that was.

Q. The whole thing would be eight dollars and something per cubic yard?

A. No, it might be more and it might be less; I really don't know.

Q. How about re-enforced circular concrete tanks underground; didn't you find any such tank or tanks?

A. I did not, but all the difficulty in regard to that is obviated by the fact that I did not vary largely in my figures from the figures given.

5271 Q. No, I am speaking now about the buildings and not the apparatus. Simply the buildings on which you and Mr. Mayer disagreed, and the foundations for building and apparatus which you stated you included in the cost of buildings, did you not?

A. Yes, sir.

Q. Now, what did you allow for concrete floors on the ground six inches thick?

A. They were put down at seven cents per cubic yard.

Q. Seven cents per cubic yard?

A. Per cubic yard laid.

Q. How much would that be per square foot?

A. Well, don't you see, it would be fifty-four square feet; twenty-seven cubic feet multiplied by half, and it would be fifty-four, and seven dollars—did I say seven cents?

Q. Yes?

A. Seven dollars.

Q. That is a different proposition; I thought the other was remarkable. How much would that mean per square foot, if you were simply taking the surface six inches thick? That would be half of a cubic foot, would it not?

A. Fifty-four square feet multiplied by one-half a foot gives you twenty-seven cubic feet, that would be about thirteen cents per square foot area.

Q. Six inches thick?

A. Yes.

Q. What did you allow for reinforced concrete floor with beams and expanded metal, if you found any such?

A. I have just stated to you that I did not discover any such, nor was I told of any.

Q. No, this is another proposition?

A. If I were asked anything of that sort I would require considerable time to calculate it, depending on the span, on the amount of iron used and on the loading which was expected to go on the floor; it is quite an intricate engineering question.

Q. You did find some face bricks selected from common bricks in some of the stations?

5272 A. I recall in one of the offices only. To be frank about the matter, I rather neglected the walls on the outside of the buildings, I was so busy with the apparatus.

Q. Well, you did not make any allowance for face bricks, did you, above the common brick?

A. I did not, no.

Q. Well, what grade would you allow for common bricks laid per thousand?

A. I did allow twenty-five dollars per thousand laid; it is too much it should have been twenty dollars per thousand laid.

Q. Now, can you give me the detail by which you reached the twenty-five dollars per thousand of common brick laid, what did you assume to be the average price for bricks?

A. The average price for bricks now, all hard-burned red, stock bricks of good durable quality would be somewhere between ten and twelve dollars a thousand, perhaps over. A bricklayer laying as he would lay there, would lay somewheres between one thousand and twelve hundred in a day of eight hours, to which he confines himself ordinarily.

Q. Do you think he would under the Union rules in the City of New York? Have you had any experience?

A. Pardon me, before I go any further. Of course, in regard to elaborate buildings like four-story fronts he would lay somewhat less. If he were laying pressed brick or Philadelphia pressed brick, as it is called, he would be held down or would hold himself down to about four hundred bricks a day; but if he were throwing brick into a foundation and slushing up as he went along without pointing on the outside he would be allowed to lay from fifteen hundred to two thousand, perhaps more, during the day.

Q. In New York City?

A. In New York City.

5273 Q. You have not had any bricks laid for you in New York City recently?

A. I have not, but I have looked up the matter very carefully, and this is authoritative.

Q. I wish it were. How much would you pay a laborer per day for laying bricks at that rate?

A. The actual cost would be for the bricklayer in the neighborhood of——

Q. Per thousand of brick, I mean.

A. For the bricklayer in the neighborhood of five dollars; for the hod carrier, if there was a hod carrier, in the neighborhood of thre- dollars and fifty cents, and for the day laborer probably in the neighborhood of one dollar and seventy-five cents to two dollars, and the total cost of laying this brick handled in that way, assuming it to be the plain rough common work that is done around gas works, might be about six dollars, somewheres between six dollars and seven dollars per thousand, making eighteen dollars or nineteen dollars a thousand so far.

Q. How much would you allow the labor per thousand?

A. The labor is paid by the day, the hod carrier is paid by the day, and the bricklayer is paid by the day.

Q. Yes, I understand, but we are reducing it now to a thousand?

A. And I said that all three of them together would make the cost of laying one thousand brick somewhere between six dollars and seven dollars a day.

Q. How much would you allow for the bricklayer himself in daily wages?

A. The bricklayer would probably insist on five dollars or five dollars and fifty cents as nis absolute right, and the hod carrier would stand out for three dollarst and fifty cents, and the common laborer one dollar and seventy-five cents.

Q. And if a bricklayer laid only eight hundred bricks in laying the
wall of a building instead of a thousand or twelve hundred,
5274 that would increase the cost per thousand of brick, of course?
A. Yes, but I am assured that the very, very common kind of work that is required in gas works is allowed to be built much more rapidly, particularly where you are on the ground, and where you throw in and slush up your brick as you go along.

Q. In building gas buildings above the ground bricklayers do not work in that fashion, do they?

A. Well, it is pretty rough work that I have seen about these buildings, these retort houses—they are just struck joints—half-inch joints, too, at that.

Q. Don't you know that every brick is rubbed into position and joints are struck in these gas structures above ground?

A. Haven't I been inspector for that work, with the specifications calling for everything of that sort, and I know exactly what they do do.

Q. Don't you know that it is done in the buildings of the Consolidated Gas Company?

A. I have seen the brickwork and I know just how near it was to being done as the theory calls for. It was very rough work in a good many places.

Q. You found, did you not, that the brick had been rubbed into position and the joints struck in every case above ground?

A. The bricks varied so much in quality in some of the walls, particularly at 21st Street, if I remember rightly, that they worked out for half their depth in the face of the wall.

Q. That was because the mortar may have worked out?

A. The brick was not hard, red stock; it was the commonest kind of brick.

Q. But the laying of the brick is what we are talking about now?

A. Yes. And I allowed six dollars for that.

Q. Didn't you find that those bricks so far as you observed, had been rubbed into place, and a joint struck?

A. I said they were all struck joints.
5275 Q. How much did you allow per thousand for cement?
A. I allowed the balance of the twenty-five dollars, put that as anywhere between eighteen or nineteen dollars and twenty-five dollars.

Q. How much of that would be cement?

A. Well, cement was worth, in those days when that was built——

Q. No, we are talking about *now;* that is what we are discussing.

A. With the exception of the new buildings at 132d Street, I have figured on the actual cost of what is known as cement mortar, which was made by using a lime base, mixing sand in it, and then mixing a half a barrel of cement in just before it was used, and that cost about one dollar.

Q. One dollar per thousand of brick?

A. No, I mean a half barrel of cement.

Q. How much would that be per thousand of brick, according to your theory?

A. The lime, cement and sand would be three or four dollars, according to my figures. I think the mortar in it would be about twenty dollars really, but I allowed twenty-five dollars.

Q. You have got considerably more than twenty dollars if you allowed three or four for cement and sand and mortar already. Now, how much would you allow per thousand of brick for foremen?

A. That was included in the six dollars—six or seven dollars.

Q. How much for timekeeper and hod hoisting?

A. All included in the six dollars or seven dollars.

Q. And the hod hoisting also?

A. All that sort of thing.

Q. How can you include hod-hoisting apparatus and scaffolding in your cost of labor?

A. Because it is put in in making an engineering estimate and because of those reasons instead of sticking to the twenty dollars we simply put it at twenty-five dollars.

5276 Q. That would be material, wouldn't it? The hod-hoisting apparatus and the scaffolding would be material instead of labor, would not it?

A. Oh, no; no; that is simply what might be called day work, that hoisting apparatus and the scaffolding and that sort of thing. Unless a regular contractor has it you lose it.

Q. Did you go into details in your figuring of values of buildings as to the cost of windows, say twelve inch by eighteen inch panes, one-quarter American glass?

A. In the very limited time at my disposal it was totally impossible to do anything of the sort.

Q. How much did you allow for tar and gravel roof, five-ply, having two-inch plank, how much per square foot or square yard, either one?

A. A tar and gravel roof laid on sheeting, it is a good roof too, costs on an average of four cents per square foot.

Q. Four cents?

A. Four cents per square foot; and a tin roof costs on an average of about eight and one-half cents, and a slate roof costs on an average of about ten cents a square foot.

Q. How about slate laid on boards or terra cotta?

A. Ten cents.

Q. Well, I understand that in your estimate, in making your estimate of the value of these buildings you did not go into any of these details in making up your computation, but made a general estimate in the time at your disposal?

A. I had to, yes, in the time I had.

Q. In reference to the foundations, did you take into account the cost of steam pump sheet piling?

A. That was all allowed for in the exceedingly liberal addition of fifty per cent. wherever there was a question of piling in a foundation.

Q. Is that also true as to temporary blocking and shoring?

A. In the case of water works, if you know what I mean 5277 by a hydraulic work, like piling, anything of that sort, I intended in the rapid work which I was forced to do to more than cover it all by the allowance of fifty per cent.

Q. Did that include the permits for the use of the streets which we had to get and pay for, or didn't you know that there was any such?

A. No; I didn't include it.

Q. How did you compute the cubical contents of these various buildings, by taking the dimensions as they were given in the statement furnished by Mr. Mayer?

A. I did.

Q. And did you allow anything for the space taken up by the roofs, if the roofs were not flat—I mean, taken up between the top of the walls and the elevated roof if the roof part was not flat?

A. In some cases, where I recall it, the ceiling was peaked, and the peak was not given, assuming the peak to be one-quarter the span above the level of the side walls, the height was increased by one-eighth the height of the walls in order to get the cubical contents in a liberal way, so as to avoid any possibility of making them too small.
